12/04/2020	33	7(h) Expedited NON-DISPOSITIVE MOTION to Intervene by James Gesbeck. (Attachments: # 1 Certificate of Service)(lz)
12/04/2020	34	MOTION for Leave to File Excess Pages by Tony Evers. (Mandell, Jeffrey)
12/04/2020	35	NOTICE of Appearance by Sidney Powell on behalf of All Plaintiffs. Attorney(s) appearing: Sidney Powell (Powell, Sidney)
12/04/2020	36	TEXT ONLY ORDER signed by Chief Judge Pamela Pepper on 12/4/2020 re 34 MOTION for Leave to File Excess Pages filed by Tony Evers: The defendant seeks leave to file a brief in excess of the thirty pages allowed by Civil L.R. 7(f) because he proposes

		to both oppose the plaintiff's amended motion for injunctive relief and support his own, not yet filed motion to dismiss in the same pleading. The court appreciates any party's effort to streamline litigation, but would prefer that the defendant file separate briefs opposing the plaintiff's amended motion and supporting his own. This will avoid confusion when the plaintiff responds. The court **DENIES** the defendant's motion for leave to file excess pages. **NOTE: There is no document associated with this text-only order.** (cc: all counsel)(Pepper, Pamela)
12/04/2020	37	ORDER signed by Chief Judge Pamela Pepper on 12/4/2020 allowing James Gesbeck to file *amicus curiae* brief by 5:00 PM on 12/7/2020. (cc: all counsel, via mail to James Gesbeck)(cb)
12/05/2020	38	TEXT ONLY ORDER signed by Chief Judge Pamela Pepper on 12/5/2020 re 22 MOTION to Intervene filed by Democratic National Committee signed by Chief Judge Pamela Pepper on 12/5/2020: Under Civil L.R. 7(b), the plaintiff's response is due by December 25, 2020; because December 25 is a federal holiday, the court **ORDERS** that the plaintiff's response is due by December 28, 2020. **NOTE: There is no document associated with this text-only order.** (cc: all counsel)(Pepper, Pamela)
12/05/2020	39	TEXT ONLY ORDER signed by Chief Judge Pamela Pepper on 12/05/2020 re 33 MOTION to Intervene filed by James Gesbeck: Under Civil L.R. 7(h), the plaintiff's response is due by Friday, December 11, 2020. **NOTE: There is no document associated with this text-only order.** (cc: all counsel)(Pepper, Pamela)
12/05/2020	40	Expedited MOTION to Intervene by Democratic National Committee. (Umberger, Michelle)
12/06/2020	41	ORDER signed by Chief Judge Pamela Pepper on 12/6/2020. 40 Movant DNC's expedited motion to intervene GRANTED to extent that court has expedited its ruling on original motion to intervene. 22 Movant DNC's original motion to intervene DENIED. Movant DNC may file *amicus curiae* brief by 5:00 PM on 12/7/2020. (cc: all counsel)(cb)
12/06/2020	42	BRIEF in Support filed by William Feehan re 10 Emergency MOTION to Amend/Correct Docket # 6: PLAINTIFFS CORRECTED MOTION FOR DECLARATORY, EMERGENCY, AND PERMANENT INJUNCTIVE RELIEF *Amended Brief*. (Dean, Michael)
12/06/2020	43	MOTION To File Separate Reply Briefs by William Feehan. (Dean, Michael)
12/06/2020	44	MOTION To Hold Consolidated Evidentiary Hearing/Trial by William Feehan. (Dean, Michael)
12/07/2020	45	TEXT ONLY ORDER signed by Chief Judge Pamela Pepper on 12/7/2020 re 43 MOTION To File Separate Reply Briefs filed by William Feehan: The court **GRANTS** the plaintiff's motion for leave to file separate reply briefs. If the defendants file a single opposition brief, the plaintiff must file one reply to that brief. If the defendants file separate opposition briefs, the plaintiff may file a reply for each opposition brief. The plaintiff also may file a separate reply for each brief filed by an amicus. (In other words, the plaintiff could file up to four reply briefs if the defendants file separate briefs and each amicus files a brief.) If the defendants file a separate motion to dismiss, the plaintiff may file an opposition brief of up to thirty pages under Civil L.R. 7(b). **NOTE: There is no document associated with this text-only order.** (cc: all counsel)(Pepper, Pamela)
12/07/2020		NOTICE of Hearing: Status Conference set for 12/8/2020 at 11:00 AM by telephone before Chief Judge Pamela Pepper. The parties are to appear by calling the court's conference line at 888-557-8511 and entering access code 4893665#. (cc: all counsel)(cb)
12/07/2020	46	RESPONSE to Motion filed by Marge Bostelmann, Julie M Glancey, Ann S Jacobs, Dean

		Knudson, Robert F Spindell, Jr, Mark L Thomsen, Wisconsin Elections Commission re 44 MOTION To Hold Consolidated Evidentiary Hearing/Trial . (Murphy, Sean)

IN THE UNITED STATES DISTRICT COURT

EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN and DERRICK VAN ORDEN,

Plaintiffs.

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

CASE NO. 2:20-cv-1771

COMPLAINT FOR DECLARATORY, EMERGENCY, AND PERMANENT INJUNCTIVE RELIEF

NATURE OF THE ACTION

1. This civil action brings to light a massive election fraud, multiple violations of the Wisconsin Election Code, *see, e.g.,* Wis. Stat. §§ 5.03, *et. seq.*, in addition to the Election and Electors Clauses and Equal Protection Clause of the U.S. Constitution. These violations occurred during the 2020 General Election throughout the State of Wisconsin, as set forth in the affidavits of dozens of eyewitnesses and the statistical anomalies and mathematical impossibilities detailed in the affidavits of expert witnesses.

2. The scheme and artifice to defraud was for the purpose of illegally and fraudulently

manipulating the vote count to manufacture an election of Joe Biden as President of the United States, and also of various down ballot democrat candidates in the 2020 election cycle. The fraud was executed by many means, but the most fundamentally troubling, insidious, and egregious ploy was the systemic adaptation of old-fashioned "ballot-stuffing." It has now been amplified and rendered virtually invisible by computer software created and run by domestic and foreign actors for that very purpose. This Complaint details an especially egregious range of conduct in Milwaukee County and the City of Milwaukee, along with Dane County, La Crosse County, Waukesha County, St. Croix County, Washington County, Bayfield County, Ozaukee County and various other counties throughout the Third District and throughout Wisconsin employing Dominion Systems, though this conduct occurred throughout the State at the direction of Wisconsin state election officials.

3. The multifaceted schemes and artifices implemented by Defendants and their collaborators to defraud resulted in the unlawful counting, or fabrication, of hundreds of thousands of illegal, ineligible, duplicate or purely fictitious ballots in the State of Wisconsin, that collectively add up to multiples of Biden's purported lead in the State of 20,565 votes.

4. While this Complaint, and the eyewitness and expert testimony incorporated herein, identify with specificity sufficient ballots required to set aside the 2020 General Election results, the entire process is so riddled with fraud, illegality, and statistical impossibility that this Court, and Wisconsin's voters, courts, and legislators, cannot rely on, or certify, any numbers resulting from this election. Accordingly, this Court must set aside the results of the 2020 General Election and grant the declaratory and injunctive relief requested herein.

Dominion Voting Systems Fraud and Manipulation

5. The fraud begins with the election software and hardware from Dominion Voting Systems Corporation ("Dominion") used by the Wisconsin Board of State Canvassers. The Dominion systems derive from the software designed by Smartmatic Corporation, which became Sequoia in the United States.

6. Smartmatic and Dominion were founded by foreign oligarchs and dictators to ensure computerized ballot-stuffing and vote manipulation to whatever level was needed to make certain Venezuelan dictator Hugo Chavez never lost another election. *See* Ex. 1, Redacted Declaration of Dominion Venezuela Whistleblower ("Dominion Whistleblower Report"). Notably, Chavez "won" every election thereafter.

7. As set forth in the Dominion Whistleblower Report, the Smartmatic software was contrived through a criminal conspiracy to manipulate Venezuelan elections in favor of dictator Hugo Chavez:

> Importantly, I was a direct witness to the creation and operation of an electronic voting system in a conspiracy between a company known as Smartmatic and the leaders of conspiracy with the Venezuelan government. This conspiracy specifically involved President Hugo Chavez Frias, the person in charge of the National Electoral Council named Jorge Rodriguez, and principals, representatives, and personnel from Smartmatic. The purpose of this conspiracy was to create and operate a voting system that could change the votes in elections from votes against persons running the Venezuelan government to votes in their favor in order to maintain control of the government. In mid-February of 2009, there was a national referendum to change the Constitution of Venezuela to end term limits for elected officials, including the President of Venezuela. The referendum passed. This permitted Hugo Chavez to be re-elected an unlimited number of times. . . .
>
> Smartmatic's electoral technology was called "Sistema de Gestión Electoral" (the "Electoral Management System"). Smartmatic was a pioneer in this area of computing systems. Their system provided for transmission of voting data over the internet to a computerized central tabulating center. The voting machines themselves had a digital display, fingerprint recognition feature to identify the voter, and printed out the voter's ballot. The voter's thumbprint was linked to a computerized record of that voter's identity. Smartmatic created and operated the

entire system. *Id.* ¶¶ 10 & 14.

8. A core requirement of the Smartmatic software design ultimately adopted by Dominion for Wisconsin's elections was the software's ability to hide its manipulation of votes from any audit. As the whistleblower explains:

> Chavez was most insistent that Smartmatic design the system in a way that the system could change the vote of each voter without being detected. He wanted the software itself to function in such a manner that if the voter were to place their thumb print or fingerprint on a scanner, then the thumbprint would be tied to a record of the voter's name and identity as having voted, but that voter would not tracked to the changed vote. He made it clear that the system would have to be setup to not leave any evidence of the changed vote for a specific voter and that there would be no evidence to show and nothing to contradict that the name or the fingerprint or thumb print was going with a changed vote. Smartmatic agreed to create such a system and produced the software and hardware that accomplished that result for President Chavez. *Id.* ¶15.

9. The design and features of the Dominion software do not permit a simple audit to reveal its misallocation, redistribution, or deletion of votes. First, the system's central accumulator does not include a protected real-time audit log that maintains the date and time stamps of all significant election events. Key components of the system utilize unprotected logs. Essentially this allows an unauthorized user the opportunity to arbitrarily add, modify, or remove log entries, causing the machine to log election events that do not reflect actual voting tabulations—or more specifically, do not reflect the actual votes of or the will of the people.[1]

10. This Complaint will show that Dominion violated physical security standards by connecting voting machines to the Internet, allowing Dominion, domestic third parties or hostile foreign actors to access the system and manipulate election results, and moreover potentially to

[1] *See* Ex. 7, August 24, 2020 Declaration of Harri Hursti, ¶¶45-48 (expert testimony in Case 1:17-cv-02989 in the U.S. District Court for the Northern District of Georgia). The Texas Secretary of State refused to certify Dominion for similar reasons as those cited by Mr. Hursti. *See* Ex. 9, State of Texas Secretary of State, Elections Division, Report of Review of Dominion Voting Systems Democracy Suite 5.5-A at 2 (Jan. 24, 2020).

cover their tracks due to Dominion's unprotected log. Accordingly, a thorough forensic examination of Dominion's machines and source code (pursuant to Wisconsin Statute § 5.905) is required to document these instances of voting fraud, as well as Dominion's systematic violations of the Voting Rights Act record retention requirements through manipulation, alteration, destruction and likely foreign exfiltration of voting records. See 52 U.S.C. § 20701.

11. These and other problems with Dominion's software have been widely reported in the press and been the subject of investigations. In certifying Dominion Voting Systems Democracy Suite, Wisconsin officials disregarded all the concerns that caused Dominion software to be rejected by the Texas Board of elections in 2020 because it was deemed vulnerable to undetected and non-auditable manipulation. Texas denied Certification because of concerns that it was not safe from fraud or unauthorized manipulation. (See Exhs 11 A and B).

12. An industry expert, Dr. Andrew Appel, Princeton Professor of Computer Science and Election Security Expert has recently observed, with reference to Dominion Voting machines: "I figured out how to make a slightly different computer program that just before the polls were closed, it switches some votes around from one candidate to another. I wrote that computer program into a memory chip and now to hack a voting machine you just need 7 minutes alone with a screwdriver."[2]

13. In addition to the Dominion computer fraud, this Complaint identifies several additional categories of "traditional" voting fraud that occurred as a direct result of Defendant Wisconsin Election Commission ("WEC") and other Defendants directing Wisconsin clerks and other election officials to ignore or violate the express requirements of the Wisconsin Election Code.

[2] Andrew W. Appel, *et al.*, "Ballot Marking Devices (BMDs) Cannot Assure the Will of the Voters" at (Dec. 27, 2019),(attached hereto as Exh. 10 ("Appel Study")).

First, the WEC issued "guidance" to county and municipal clerks not to reject "indefinitely confined" absentee voters, even if the clerks possess "reliable information" that the voter is no longer indefinitely confined, in direct contravention of Wisconsin Statute § 6.86(2)(6), which states that clerks must remove such voters. Second, the WEC issued further guidance directing clerks – in violation of Wisconsin Statute § 6.87(6)(d), which states that an absentee envelope certification "is missing the address of a witness, the ballot may not be counted" – to instead fill in the missing address information.

14. This Complaint presents expert witness testimony demonstrating that several hundred thousand illegal, ineligible, duplicate or purely fictitious votes must be thrown out, in particular:

A. A report from Dr. William Briggs, showing that there were approximately 29,594 absentee ballots listed as "unreturned" by voters that either never requested them, or that requested and returned their ballots;

B. Reports from Redacted Expert Witnesses who can show an algorithm was used to pick a winner.

15. In the accompanying redacted declaration of a former electronic intelligence analyst with 305th Military Intelligence with experience gathering SAM missile system electronic intelligence, the Dominion software was accessed by agents acting on behalf of China and Iran in order to monitor and manipulate elections, including the most recent US general election in 2020. (See Ex. 12, copy of redacted witness affidavit).

16. These and other "irregularities" demonstrate that at least 318,012 illegal ballots were counted in Wisconsin. This provides the Court with sufficient grounds to set aside the results of the 2020 General Election and provide the other declaratory and injunctive relief requested herein.

JURISDICTION AND VENUE

17. This Court has subject matter under 28 U.S.C. § 1331 which provides, "The district courts shall have original jurisdiction of all civil actions arising under the Constitution, laws, or treaties

of the United States."

18. This Court also has subject matter jurisdiction under 28 U.S.C. § 1343 because this action involves a federal election for President of the United States. "A significant departure from the legislative scheme for appointing Presidential electors presents a federal constitutional question." *Bush v. Gore*, 531 U.S. 98, 113 (2000) (Rehnquist, C.J., concurring); *Smiley v. Holm*, 285 U.S. 355, 365 (1932).

19. The jurisdiction of the Court to grant declaratory relief is conferred by 28 U.S.C. §§ 2201 and 2202 and by Rule 57, Fed. R. Civ. P.

20. This Court has jurisdiction over the related Wisconsin constitutional claims and state-law claims under 28 U.S.C. § 1367.

21. Venue is proper because a substantial part of the events or omissions giving rise to the claim occurred in the Eastern District. 28 U.S.C. § 1391(b) & (c).

22. Because the United States Constitution reserves for state legislatures the power to set the time, place, and manner of holding elections for Congress and the President, state executive officers have no authority to unilaterally exercise that power, much less flout existing legislation.

THE PARTIES

23. Plaintiff William Feehan, is a registered Wisconsin voter and a nominee of the Republican Party to be a Presidential Elector on behalf of the State of Wisconsin. Mr. Feehan is a resident of the City of La Crosse and La Crosse County, Wisconsin.

24. Presidential Electors "have a cognizable interest in ensuring that the final vote tally reflects the legally valid votes cast," as "[a]n inaccurate vote tally is a concrete and particularized injury to candidates such as the Electors." *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020) (affirming that Presidential Electors have Article III and prudential standing to challenge actions

of state officials implementing or modifying State election laws); *see also McPherson v. Blacker*, 146 U.S. 1, 27 (1892); *Bush v. Palm Beach Cty. Canvassing Bd.*, 531 U.S. 70, 76 (2000) (per curiam).

25. Plaintiff Feehan has standing to bring this action as a voter and as a candidate for the office of Elector under Wis. Stat. §§ 5.10, et seq (election procedures for Wisconsin electors). As such, Presidential Electors "have a cognizable interest in ensuring that the final vote tally reflects the legally valid votes cast," as "[a]n inaccurate vote tally is a concrete and particularized injury to candidates such as the Electors." *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020) (affirming that Presidential Electors have Article III and prudential standing to challenge actions of state officials in implementing or modifying State election laws); *see also McPherson v. Blacker*, 146 U.S. 1, 27 (1892); *Bush v. Palm Beach Cty. Canvassing Bd.*, 531 U.S. 70, 76 (2000) (per curiam).

26. Plaintiff Derrick Van Orden is a former United States Navy SEAL, who was the 2020 Republican nominee for Wisconsin's Third Congressional District Seat for the United States House of Representatives. Mr. Van Orden is a resident of Hager City, Pierce County, Wisconsin.

27. Mr. Van Orden "lost" by approximately 10,000 votes to the Democrat incumbent, U.S. Representative Ron Kind. Because of the illegal voting irregularities as will be shown below, Mr. Van Orden seeks to have a new election ordered by this court in the Third District, with that election being conducted under strict adherence with the Wisconsin Election Code.

28. Plaintiff Van Orden has standing as the ostensible "defeated" candidate in the Third Congressional District race, and seeks an order for a new election, complying with Wisconsin election law. Plaintiff Van Order received 189,524 votes or 48.67% as tallied versus Ron Kind who received 199,870 or 51.33% of the votes as reportedly tallied.

29. Plaintiffs brings this action to prohibit certification of the election results for the Office of President of the United States in the State of Wisconsin and to obtain the other declaratory and injunctive relief requested herein. Those results were certified by Defendants on November 30, 2020, indicating a plurality for Mr. Biden of 20,565 votes out of 3,240,867 cast.

30. The Defendants are Wisconsin Elections Commission ("WEC"), a state agency, and its members Ann S. Jacobs, Mark L. Thomsen, Marge Bostelman, Julie M. Glancey, Dean Knudson, and Robert F. Spindell, Jr., in their official capacities

31. Defendant Governor Tony Evers is named as a defendant in his official capacity as Wisconsin's governor.

32. Defendant WEC was created in 2015 by the Wisconsin Legislature as an independent agency under the Executive branch to administer Wisconsin's election laws. Wis. Stat. §§ 5.03 & 15.61. The WEC is authorized to adopt administrative rules pursuant to Chapter 227 of the Wisconsin Statutes, but nothing under Wisconsin's election laws authorizes the WEC to issue any documents, make any oral determinations or instruct governmental officials administering elections to perform any act contrary to Wisconsin law governing elections.

33. Furthermore, the Wisconsin Legislature also created municipal elections commissions for municipalities with a population greater than 500,000 and a county elections commissions for counties with a population greater than 750,000. Wis Stat. § 7.20. As a result, the City of Milwaukee Elections Commission was created as well as the Milwaukee County Elections Commission and the Dane County Elections Commission. These county and municipal elections commissions are responsible for administering the elections in their respective jurisdictions.

STATEMENT OF FACTS

34. Plaintiffs bring this action under 42 U.S.C. §§ 1983 and 1988, to remedy deprivations of rights, privileges, or immunities secured by the Constitution and laws of the United States and to contest the election results, and the corollary provisions under the Wisconsin Constitution.

35. The United States Constitution sets forth the authority to regulate federal elections. With respect to congressional elections, the Constitution provides:

> The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by Law make or alter such Regulations, except as to the Places of choosing Senators.
>
> U.S. CONST. art. I, § 4 ("Elections Clause").

36. With respect to the appointment of presidential electors, the Constitution provides:

> Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress: but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.
>
> U.S. CONST. art. II, § 1 ("Electors Clause").

37. None of Defendants is a "Legislature" as required under the Elections Clause or Electors Clause to set the rules governing elections. The Legislature is "'the representative body which ma[kes] the laws of the people.'" *Smiley*, 285 U.S. 365. Regulations of congressional and presidential elections, thus, "must be in accordance with the method which the state has prescribed for legislative enactments." Id. at 367; *see also Ariz. State Legislature v. Ariz. Indep. Redistricting Comm'n*, 576 U.S. 787, 135 S. Ct. 2652, 2668 (U.S. 2015).

38. The WEC certified the Presidential Election results on November 30, 2020. The Presidential election results in Wisconsin show a difference of 20,565 "tallied" votes in favor of former Vice-President Joe Biden over President Trump.

39. Based upon all the allegations of fraud, statutory violations, and other misconduct, as stated herein and in the attached affidavits, it is necessary to enjoin the certification of the election results pending a full investigation and court hearing, and to order an independent audit of the November 3, 2020 election to ensure the accuracy and integrity of the election.

I. VIOLATIONS OF WISCONSIN ELECTION CODE

A. WEC Directed Clerks to Violate Wisconsin Election Code Requirements for Absentee Voting by "Indefinitely Confined" without Photo ID.

40. The Wisconsin State Legislature adopted Act 23 in 2011 to require Wisconsin electors to present an identification containing a photograph, such as a driver's license, to either a municipal or county clerk, when registering to vote and when voting. Wis. Stat. §§ 6.34; 6.79 (2). The Wisconsin State Legislature adopted the photo ID requirement to deter the casting of ballots by persons either not eligible to vote or persons fraudulently casting multiple ballots. *League of Women Voters of Wisconsin Education Network, Inc. v. Walker,* 851 N.W.2d 302, 314 (Wis. 2014).

41. Wisconsin's absentee voting is governed by Wisconsin Statutes § 6.84 - § 6.89. Under Wisconsin Statutes §6.86, every absentee elector applicant must present a photo ID when registering to vote absentee except absentee voters who registered as "indefinitely confined," Wis. Stat. §6.86 (ac), meaning someone confined "because of age, physical illness or infirmity or is disabled for an indefinite period." Wis. Stat. § 6.86(2)(a). As a result, Wisconsin election procedures for voting absentee based on "indefinitely confined" status circumvent the photo ID requirement, creating an avenue for fraudulent voting.

42. In order to ensure that only those who are "indefinitely confined" may use the "indefinitely confined" absentee ballot in an election, Wisconsin Statutes §6.86 provides that any elector who files an application for an absentee ballot based on indefinitely confined status may not use the absentee ballot if the electoral is no longer "indefinitely confined." Wisconsin Statutes § 6.86 (2)(b) further

provides that the municipal clerk "shall remove the name of any other elector from the list upon request of the elector or upon receipt of reliable information that an elector no longer qualifies for the service."

43. Despite this clear statutory requirement, the Administrator of the Wisconsin Election Commission, Meagan Wolfe, issued a written directive on May 13, 2020 to the clerks across the State of Wisconsin stating that the clerks cannot remove an allegedly "indefinitely confined" absentee voter from the absentee voter register if the clerk had "reliable information" that an allegedly "indefinitely confined" absentee voter is no longer "indefinitely confined." The directive specifically stated:

> Can I deactivate an absentee request if I believe the voter is not indefinitely confined? No. All changes to status must be made in writing and by the voter's request. Not all medical illnesses or disabilities are visible or may only impact the voter intermittently. (*See* WEC May 13, 2020 Guidance Memorandum).

44. The WEC's directive thus directly contradicts Wisconsin law, which specifically provides that clerks "shall" remove an indefinitely confined voter from the absentee voter list if the clerk obtains "reliable information" that the voter is no longer indefinitely confined.

45. As a result of the directive, clerks did not remove from the absentee voter lists maintained by their jurisdictions the absentee voters who claimed "indefinitely confined" status but who in fact were no longer "indefinitely confined." This resulted in electors who were allegedly "indefinitely confined" absentee voters casting ballots as "indefinitely confined" absentee voters who were not actually "indefinitely confined" absentee voters.

B. WEC Directed Clerks to Violate Wisconsin Law Prohibiting Counting of Absentee Ballot Certificates Missing Witness Addresses.

46. In 2015, the Wisconsin Legislature passed Act 261, amending Wisconsin's election laws, including a requirement, codified as Wisconsin Statute § 6.87(d), that absentee ballots include both

elector and witness certifications, which must include the address of the witness. If the address of the witness is missing from the witness certification, however, "the ballot may not be counted." *Id.*

47. On October 18, 2016, WEC reacted to this legislation by issuing a memorandum, which, among other things, permitted clerks to write in the witness address onto the absentee ballot certificate itself, effectively nullifying this express requirement. (*See* WEC October 18, 2016 Guidance Memorandum). Wisconsin election officials reiterated this unlawful directive in publicly posted training videos. For example, in a Youtube video posted before the November 3, 2020 General Election by Clarie Woodall-Voog of the Milwaukee Elections Commission, Ms. Woodall-Voog advised clerks that missing items "like witness address may be written in red."[3]

C. WEC Directed Clerks to Illegally Cure Absentee Ballots by Filling in Missing Information on Absentee Ballot Certificates and Envelopes.

48. On October 19, 2020, WEC instructed its clerks that, without any legal basis in the Wisconsin Election Code, they could simply fill in missing witness or voter certification information using, e.g., personal knowledge, voter registration information, or calling the voter or witness. The WEC further advised that voters or witnesses could cure any missing information at the polling place, again without citing any authority to do so under Wisconsin Election Code.

II. EXPERT WITNESS TESTIMONY: EVIDENCE OF WIDESPREAD VOTER FRAUD

A. Approximately 15,000 Wisconsin Mail-In Ballots Were Lost, and Approximately 18,000 More Were Fraudulently Recorded for Voters who Never Requested Mail-In Ballots.

49. The attached report of William M. Briggs, Ph.D. ("Dr. Briggs Report") summarizes the multi-state phone survey that includes a survey of Wisconsin voters collected by Matt Braynard,

[3] *See* https://www.youtube.com/watch?v=hbm-pPaYiqk (video a 10:43 to 11:07).

which was conducted from November 15-17, 2020. *See* Ex. 101, Dr. Briggs Report at 1, and Att. 1 ("Braynard Survey"). The Briggs analysis identified two specific errors involving unreturned mail-in ballots that are indicative of voter fraud, namely: "**Error #1:** those who were recorded as receiving absentee ballots ***without*** requesting them;" and "**Error #2:** those who returned absentee ballots but whose votes went missing (*i.e.*, marked as unreturned)." *Id.* Dr. Briggs then conducted a parameter-free predictive model to estimate, within 95% confidence or prediction intervals, the number of ballots affected by these errors out of a total of 96,771 unreturned mail-in ballots for the State of Wisconsin.

50. With respect to **Error #1**, Dr. Briggs' analysis estimated that **16,316-19,273 ballots** out of the total 96,771 unreturned ballots were recorded for voters who had **not** requested them. *Id.* With respect to **Error #2**, he found **13,991 – 16,757 ballots** out of 96,771 unreturned ballots recorded for voters who **did return their ballots were recorded as being unreturned.** *Id.* Taking the average of the two types of errors together, **29,594 ballots, or 31% of the total, are "troublesome."**

51. These errors are not only conclusive evidence of widespread fraud by the State of Wisconsin, but they are fully consistent with the fact witness statements cited above regarding the evidence about Dominion presented below insofar as **these unreturned absentee ballots represent a pool of blank ballots that could be filled in by third parties to shift the election to Joe Biden,** and also present the obvious conclusion that there must be absentee ballots unlawfully ordered by third parties that were returned.

52. With respect to **Error #1**, Dr. Briggs' analysis demonstrates that approximately **17,795 absentee ballots were sent to someone besides the registered voter named in the request**, and thus could have been filled out by anyone and then submitted in the name of another voter.

Regarding ballots ordered by third parties that were voted, those would no longer be in the unreturned pool and therefore cannot be estimated from this data set.

53. With respect to **Error #2**, Dr. Briggs' analysis indicates that approximately **15,374 absentee ballots were either lost or destroyed** (consistent with allegations of Trump ballot destruction) **and/or were replaced with blank ballots filled out by election workers, Dominion or other third parties.** Dr. Briggs' analysis shows that 31% of "unreturned ballots" suffer from one of the two errors above – which is consistent with his findings in the four other States analyzed (Arizona 58%, Georgia 39%, Pennsylvania 37%, and Wisconsin 45%) – and provides further support that these widespread "irregularities" or anomalies were one part of a much larger multi-state fraudulent scheme to rig the 2020 General Election for Joe Biden.

B. Nearly 7,000 Ineligible Voters Who Have Moved Out-of-State Illegally Voted in Wisconsin.

54. Evidence compiled by Matt Braynard using the National Change of Address ("NCOA") Database shows that 6,207 Wisconsin voters in the 2020 General Election moved out-of-state prior to voting, and therefore were ineligible. Mr. Braynard also identified 765 Wisconsin voters who subsequently registered to vote in another state and were therefore ineligible to vote in the 2020 General Election. The merged number is 6,966 ineligible voters whose votes must be removed from the total for the 2020 General Election.[4]

C. A Statistical Study Reveals that Biden Overperformed in those Precincts that Relied on Dominion Voting Machines

55. From November 13th, 2020 through November 28th, 2020, the Affiant conducted in-depth statistical analysis of publicly available data on the 2020 U.S. Presidential Election. This data

[4] Mr. Braynard posted the results of his analysis on Twitter. *See* https://twitter.com/MattBraynard/status/1329700178891333634?s=20. This Complaint includes a copy of his Report, (attached hereto as Exh. 3).

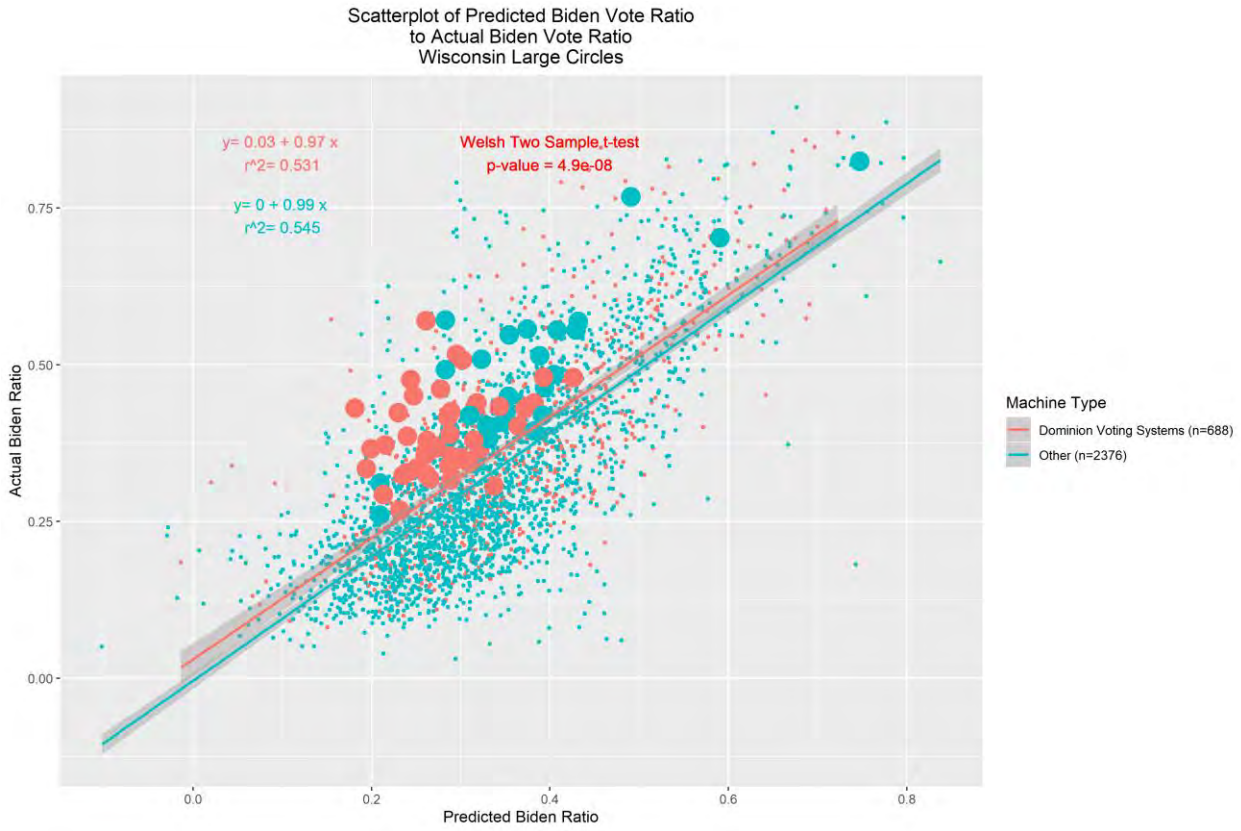
included vote counts for each county in the United States, U.S. Census data, and type of voting machine data provided by the U.S. Election Assistance Committee. The Affiant's analysis yielded several "red flags" concerning the percentage of votes won by candidate Biden in counties using voting machines provided by Dominion Voting Systems. These red flags occurred in several States in the country, including Wisconsin. (See attached hereto as Exh. 4, copy of redacted Affiant, B.S. Mathematics and M.S. Statistics).

56. The Affiant began by using Chi-Squared Automatic Interaction Detection (CHAID), which treats the data in an agnostic way—that is, it imposes no parametric assumptions that could otherwise introduce bias. Affiant posed the following question: "Do any voting machine types appear to have unusual results?" The answer provided by the statistical technique/algorithm was that machines from Dominion Voting Systems (Dominion) produced abnormal results. *Id.*

57. Subsequent graphical and statistical analysis shows the unusual pattern involving machines from Dominion occurs in at least 100 counties and multiple States, including Wisconsin. The results from the vast majority of counties using the Dominion machines is 3 to 5.6 percentage points higher in favor of candidate Biden. This pattern is seen easily in graphical form when the results from "Dominion" counties are overlaid against results from "non-Dominion" counties. The results from "Dominion" counties do not match the results from the rest of the counties in the United States. The results are clearly statistically significant, with a p-value of < 0.00004. This translates into a statistical impossibility that something unusual involving Dominion machines is *not* occurring. This pattern appears in multiple States, including Wisconsin, and the margin of votes implied by the unusual activity would easily sway the election results. *Id.*

58. The following graph shows the pattern. The large red dots are counties in Wisconsin that use Dominion voting machines. Almost all of them are above the blue prediction line, when in

normal situations approximately half of them would be below the prediction line (as evidence by approximately half the counties in the U.S. (blue dots) that are below the blue centerline). The p-value of statistical analysis regarding the centerline for the red dots (Wisconsin counties with Dominion machines) is 0.000000049, pointing to a statistical impossibility that this is a "random" statistical anomaly. Some external force caused this anomaly:



Id.

59. To confirm that Dominion machines were the source of the pattern/anomaly, Affiant conducted further analysis using propensity scoring using U.S. census variables (including ethnicities, income, professions, population density and other social/economic data) , which was used to place counties into paired groups. Such an analysis is important because one concern could be that counties with Dominion systems are systematically different from their counterparts, so

abnormalities in the margin for Biden are driven by other characteristics unrelated to the election. *Id.*

60. After matching counties using propensity score analysis, the only difference between the groups was the presence of Dominion machines. This approach again showed a highly statistically significant difference between the two groups, with candidate Biden again averaging three percentage points higher in Dominion counties than in the associated paired county. The associated p-value is < 0.00005, against indicating a statistical impossibility that something unusual is not occurring involving Dominion machines. Id.

61. The results of the analysis and the pattern seen in the included graph strongly suggest a systemic, system-wide algorithm was enacted by an outside agent, causing the results of Wisconsin's vote tallies to be inflated by somewhere between three and five point six percentage points. **Statistical estimating yields that in Wisconsin, the best estimate of the number of impacted votes is 181,440.** *Id.*

62. The summation of sections A through C above provide the following conclusions for the reports cited above, respectively.

- returned ballots that were deemed unreturned by the state: 15,374
- unreturned mail ballots unlawfully ordered by third parties: 17,795
- votes by persons that moved out of state or subsequently registered to vote in another state for the 2020 election: 6,966
- Votes that were improperly relying on the "indefinitely confined" exemption to voter ID: 96,437
- And excess votes arising from the statistically significant outperformance of Dominion machines on behalf of Joe Biden: 181,440

In Conclusion, the Reports cited above show a total amount of illegal votes identified that amount to 318,012 or over 15 times the margin by which candidate Biden leads President Trump in the state of Wisconsin.

III. FACTUAL ALLEGATIONS REGARDING DOMINION VOTING SYSTEMS

63. The State of Wisconsin, in many locations, used either Sequoia, a subsidiary of Dominion Systems, and or Dominion Systems, Democracy Suite 4.14-D first, and then included Dominion Systems Democracy Suite 5.0-S on or about January 27, 2017, which added a fundamental modification: "dial-up and wireless results transmission capabilities to the ImageCast Precinct and results transmission using the Democracy Suite EMS Results Transfer Manager module." (See Exh. 5, attached hereto, a copy of the Equipment for WI election systems).

A. Dominion's Results for 2020 General Election Demonstrate Dominion Manipulated Election Results.

64. Affiant Keshel's findings that reflect the discussion cited above:

> While Milwaukee County is focal for transparency and observation violations, including reporting statistically impossible vote counts in the early morning hours away from scrutiny, Dane County has surged far past support totals for President Obama, despite expected difficulties mobilizing student voters to polls. President Trump has reconsolidated the Republican base in suburban Milwaukee and far surpassed his 2016 support levels but has been limited in margin growth by historically improbable Democratic support in these strongholds, which defy years of data in Wisconsin in which the Republican party surged as the Democratic Party plunged. Finally, in strong Trump counties showing a double inversion cycle (one party up, the other down), particularly in rural and exurban Wisconsin, Trump's totals are soaring, and against established trends, Biden's totals are at improbable levels of support despite lacking registration population
> (*See* attached hereto, Exh. 9, Aff. of Seth Keshel, MBA)

County	Rep '08	Dem '08	Rep '12	Dem '12	Rep '16	Dem '16	Rep '20	Dem '20	Dem Percentage of Obama 2008 Votes
Ozaukee	32,172	20,579	36,077	19,159	30,464	20,170	33,912	26,515	128.8%
% Increase	N/A	N/A	12.1%	(6.9%)	(15.6%)	5.3%	11.3%	31.5%	

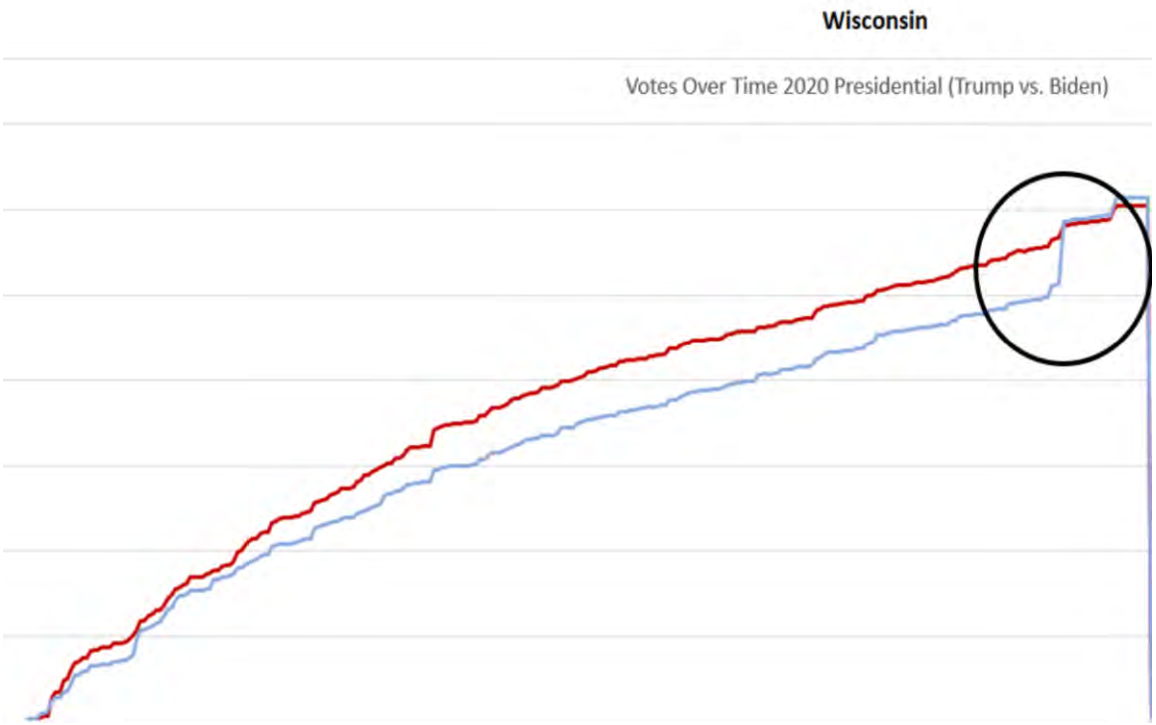
Dane	73,065	205,984	83,644	216,071	71,275	217,697	78,789	260,157	126.3%
% Increase	N/A	N/A	14.5%	4.9%	(14.8%)	0.8%	10.5%	19.5%	

Waukesha	145,152	85,339	162,798	78,779	142,543	79,224	159,633	103,867	121.7%
% Increase	N/A	N/A	12.2%	(7.7%)	(12.4%)	0.6%	12.0%	31.1%	

Racine	45,954	53,408	49,347	53,008	46,681	42,641	54,475	50,154	117.6%
% Increase	N/A	N/A	7.4%	(0.7%)	(5.4%)	(19.6%)	16.7%	17.6%	

Id.

65. Keshel provides a graph reflecting the voter returns in a time-series. The highly unlikely and remarkably convenient attainment of this block of votes provides for a stunning depiction of the election and generates many questions. The analysis provided by Plaintiffs' multiple experts, including data, statistics and cyber, will reveal clear evidence of the multiple frauds that combined to change the outcome of the 2020 election.



See Id.

B. Administrative and Judicial Decisions Regarding Dominion's Security Flaws.

66. **Wisconsin.** In 2018, Jill Stein was in litigation with Dominion Voting Systems ("DVS") after her 2016 recount request pursuant to WISCONSIN STAT.§5.905(4) wherein DVS obtained a Court Order requiring confidentiality on information including *voting counting source code*, which Dominion claims is proprietary – and must be kept secret from the public. (*See* unpublished decision, Wisconsin Court of Appeals, No. 2019AP272 issued April 30, 2020). Rather than engaging in an open and transparent process to give credibility to Wisconsin's Dominion-Democracy Suite voting system, the processes were hidden during the receipt, review, opening, and tabulation of those votes in direct contravention of Wisconsin's Election Code and Federal law.

67. **Texas.** The same Dominion Democracy Suite was denied certification in Texas by the

Secretary of State on January 24, 2020, specifically because the "examiner reports raise concerns about whether Democracy Suite 5.5-A system … **is safe from fraudulent or unauthorized manipulation**."[5]

68. **Georgia.** Substantial evidence of this vulnerability was discussed in Judge Amy Totenberg's October 11, 2020 Order in the USDC N.D. Ga. case of *Curling, et al. v. Kemp, et. al*, Case No. 1:17-cv-02989 Doc. No. 964. *See*, p. 22-23 ("This array of experts and subject matter specialists provided a huge volume of significant evidence regarding the security risks and deficits in the system as implemented in both witness declarations and live testimony at the preliminary injunction hearing."); p. 25 ("In particular, Dr. Halderman's testing indicated the practical feasibility through a cyber attack of causing the swapping or deletion of specific votes cast and the compromise of the system through different cyber attack strategies, including through access to and alteration or manipulation of the QR barcode.") The full order should be read, for it is eye-opening and refutes many of Dominion's erroneous claims and talking points.

69. A District Judge found that Dominion's BMD ballots are not voter verifiable, and they cannot be audited in a software independent way. The credibility of a BMD ballot can be no greater than the credibility of Dominion's systems, which copious expert analysis has shown is deeply compromised. Similar to the issues in Wisconsin, Judge Totenberg of the District Court of Georgia Northern District held:

> Georgia's Election Code mandates the use of the BMD system as the uniform mode of voting for all in-person voters in federal and statewide elections. O.C.G.A. § 21-2-300(a)(2). The statutory provisions mandate voting on "electronic ballot markers" that: (1) use "electronic technology to independently and privately mark a paper ballot at the direction of an elector, interpret ballot selections, ... such interpretation **for elector verification**, and print **an elector verifiable paper**

[5] See attached hereto, as Exh. 11, State of Texas Secretary of State, Elections Division, *Report of Review of Dominion Voting Systems Democracy Suite 5.5-A* at 2 (Jan. 24, 2020) (emphasis added).

> **ballot**;" and (2) "produce paper ballots which are marked with the elector's choices **in a format readable by the elector**" O.C.G.A. § 21-2-2(7.1); O.C.G.A. § 21-2-300(a)(2). Plaintiffs and other voters who wish to vote in-person are required to vote on **a system that does none of those things**. Rather, the evidence shows that the Dominion BMD system does **not produce a voter-verifiable paper ballot or a paper ballot marked with the voter's choices in a format readable by the voter because the votes are tabulated solely from the unreadable QR code**.
>
> See Order, pp. 81-82. (Emphasis added).

70. This case was later affirmed in a related case, in the Eleventh Circuit in 2018 related to Georgia's voting system in *Common Cause Georgia v. Kemp*, 347 F. Supp. 3d 1270 (11th Cir. 2018). The Court found,

> **In summary, while further evidence will be necessary in the future, the Court finds that the combination of the statistical evidence and witness declarations in the record here (and the expert witness evidence in the related *Curling* case which the Court takes notice of) persuasively demonstrates the likelihood of Plaintiff succeeding on its claims. Plaintiff has shown a substantial likelihood of proving that the Secretary's failure to properly maintain a reliable and secure voter registration system has and will continue to result in the infringement of the rights of the voters to cast their vote and have their votes counted.**
>
> *Id.at* 1294-1295.

71. The expert witness in the above litigation in the United States District Court of Georgia, Case 1:17-cv-02989-AT, Harri Hursti, specifically testified to the acute security vulnerabilities, *see* Ex. 107, wherein he testified or found:

> A. "The scanner and tabulation software settings being employed to determine which votes to count on hand marked paper ballots are likely causing clearly intentioned votes to be counted" "The voting system is being operated in Fulton County in a manner that escalates the security risk to an extreme level" "Votes are not reviewing their BMD printed ballots, which causes BMD generated results to be un-auditable due to the untrustworthy audit trail." 50% or more of voter selections in some counties were visible to poll workers. Dominion employees maintain near exclusive control over the EMS servers. "In my professional opinion, the role played by Dominion personnel in Fulton County, and other counties with similar arrangements, should be considered an elevated risk factor when evaluating the security

risks of Georgia's voting system." *Id.* ¶26.

B. A video game download was found on one Georgia Dominion system laptop, suggesting that multiple Windows updates have been made on that respective computer.

C. There is evidence of remote access and remote troubleshooting which presents a grave security implication.

D. Certified identified vulnerabilities should be considered an "extreme security risk."

E. There is evidence of transfer of control the systems out of the physical perimeters and place control with a third party off site.

F. USB drives with vote tally information were observed to be removed from the presence of poll watchers during a recent election.

G. "The security risks outlined above – operating system risks, the failure to harden the computers, performing operations directly on the operating systems, lax control of memory cards, lack of procedures, and potential remote access are extreme and destroy the credibility of the tabulations and output of the reports coming from a voting system." *Id.* ¶49.

C. Foreign Interference/Hacking and/or Manipulation of Dominion Results.

1. Evidence of Vulnerability to Foreign Hackers.

72. In October of 2020 The FBI and CISA issued a JOINT CYBERSECURITY ADVISORY ON October 30, 2020 titled: **Iranian Advanced Persistent Threat Actor Identified Obtained Voter Registration Data**

> This joint cybersecurity advisory was coauthored by the Cybersecurity and Infrastructure Security Agency (CISA) and the Federal Bureau of Investigation (FBI). CISA and the FBI are aware of an Iranian advanced persistent threat (APT) actor targeting U.S. state websites to include election websites. CISA and the FBI assess this actor is responsible for the mass dissemination of voter intimidation emails to U.S. citizens and the dissemination of U.S. election-related disinformation in mid-October 2020.[1] (Reference FBI FLASH message ME-000138-TT, disseminated October 29, 2020). Further evaluation by CISA and the FBI has identified the targeting of U.S. state election websites was an intentional effort to influence and interfere with the 2020 U.S. presidential election.

(See CISA and FBI Joint Cyber Security Advisory of October 30, 2020, a copy attached hereto as Exh. 18.)

73. An analysis of the Dominion software system by a former US Military Intelligence expert subsequently found that the Dominion Voting system and software are accessible - and was compromised by rogue actors, including foreign interference by Iran and China. (*See* Exh. 1, Spider Declaration, (who remains redacted for security reasons).)

74. The expert does an analysis and explains how by using servers and employees connected with rogue actors and hostile foreign influences combined with numerous easily discoverable leaked credentials, Dominion allowed foreign adversaries to access data and intentionally provided access to Dominion's infrastructure in order to monitor and manipulate elections, including the most recent one in 2020. (See Exh. 12, Spider Declaration. Several facts are set forth related to foreign members of Dominion Voting Systems and foreign servers as well as foreign interference.).

75. Another Declarant first explains the foundations of her opinion and then addresses the concerns of foreign interference in our elections through hardware components from companies based in foreign countries with adverse interests. She explains that Dominion Voting Systems works with SCYTL, and that votes on route, before reporting, go to SCYTL in foreign countries. On the way, they get mixed and an algorithm is applied, which is done through a secretive process.

> The core software used by ALL SCYTL related Election Machine/Software manufacturers ensures "anonymity" Algorithms within the area of this "shuffling" to maintain anonymity allows for setting values to achieve a desired goal under the guise of "encryption" in the trap-door…
>
> (See Exh. 13, Aff. of Computer analysis, at par. 32).

76. The Affiant goes on to explain the foreign relationships in the hardware used by Dominion Voting Systems and its subsidiary Sequoia and explains specifically the port that

Wisconsin uses, which is called Edge Gateway and that is a part of Akamai Technologies based in Germany:

> "Wisconsin has EDGE GATEWAY port which is AKAMAI TECHNOLOGIES based out of GERMANY. Using AKAMAI Technologies is allowing .gov sites to obfuscate and mask their systems by way of HURRICANE ELECTRIC (he.net)"

77. This Declarant further explains the foundations of her opinion and then addresses the concerns of foreign interference in our elections through hardware components from companies based in foreign countries with adverse interests.

> The concern is the HARDWARE and the NON – ACCREDITED VSTLs as by their own admittance use COTS. The purpose of VSTL's being accredited and their importance is ensuring that there is no foreign interference / bad actors accessing the tally data via backdoors in equipment software. The core software used by ALL SCYTL related Election Machine/Software manufacturers ensures "anonymity". **Algorithms within the area of this "shuffling" to maintain anonymity allows for setting values to achieve a desired goal under the guise of "encryption" in the trap-door…**
>
> (See Id. at ¶32).

78. This Declarant goes on to explain the foreign relationships in the hardware used by Dominion Voting Systems and its subsidiary Sequoia and specifically the port that Wisconsin uses:

> "Wisconsin has EDGE GATEWAY port which is AKAMAI TECHNOLOGIES based out of GERMANY. Using AKAMAI Technologies is allowing .gov sites to obfuscate and mask their systems by way of HURRICANE ELECTRIC (he.net) Kicking it to anonymous (AKAMAI Technologies) offshore servers.
> Wisconsin Port.
>
> China is not the only nation involved in COTS provided to election machines or the networking but so is Germany via a LAOS founded Chinese linked cloud service company that works with SCYTL named Akamai Technologies that have offices in China and are linked to the server [for] Dominion Software.
>
> (See Id. at par. 21).

79. The Affiant explains the use of an algorithm and how it presents throughout the statement, but specifically concludes that,

The "Digital Fix" observed with an increased spike in VOTES for Joe Biden can be determined as evidence of a pivot. Normally it would be assumed that the algorithm had a Complete Pivot. Wilkinson's demonstrated the guarantee as:

$$\frac{\|U\|_\infty}{\|A\|_\infty} \leq n^{\frac{1}{2}\log(n)}$$

Such a conjecture allows the growth factor the ability to be upper bound by values closer to n. Therefore, complete pivoting can't be observed because there would be too many floating points. Nor can partial as the partial pivoting would overwhelm after the "injection" of votes. Therefore, external factors were used which is evident from the "DIGITAL FIX." (*See Id*. at pars. 67-69)

"The algorithm looks to have been set to give Joe Biden a 52% win even with an initial 50K+ vote block allocation was provided initially as tallying began (as in case of Arizona too). In the am of November 4, 2020 the algorithm stopped working, therefore another "block allocation" to remedy the failure of the algorithm. This was done manually as ALL the SYSTEMS shut down NATIONWIDE to avoid detection."

(*See Id*. at par. 73)

2. Background of Dominion Connections to Smartmatic and Hostile Foreign Governments.

80. An expert analysis by Russ Ramsland agrees with the data reflecting the use of an algorithm that causes the spike in the data feed, which is shown to be an injection of votes to change the outcome, because natural reporting does not appear in such a way.

81. And Russ Ramsland can support that further by documenting the data feed that came from Dominion Voting Systems to Scytl -- and was reported with decimal points, which is contrary to one vote as one ballot: **"The fact that we observed raw vote data coming directly that includes decimal places establishes selection by an algorithm, and not individual voter's choice. Otherwise, votes would be solely represented as whole numbers (votes cannot possibly be added up and have decimal places reported)."**

82. The report concludes that **"**Based on the foregoing, I believe these statistical anomalies and impossibilities compels the conclusion to a reasonable degree of professional certainty that the

vote count in Wisconsin, in particular for candidates for President contain at least 119,430 (Para. 13) up to 384,085 (Para. 15) illegal votes that must be disregarded. In my opinion, it is not possible at this time to determine the true results of the Wisconsin vote for President of the United States."

The History of Dominion Voting Systems

83. Plaintiffs can also show Smartmatic's incorporation and inventors who have backgrounds evidencing their foreign connections, including Serbia, specifically its identified inventors:

> Applicant: SMARTMATIC, CORP.
>
> Inventors**:** Lino Iglesias, Roger Pinate, Antonio Mugica, Paul Babic, Jeffrey Naveda, Dany Farina, Rodrigo Meneses, Salvador Ponticelli, Gisela Goncalves, Yrem Caruso[6]

84. Another Affiant witness testifies that in Venezuela, she was in official position related to elections and witnessed manipulations of petitions to prevent a removal of President Chavez and because she protested, she was summarily dismissed. She explains the vulnerabilities of the electronic voting system and Smartmatica to such manipulations. (See Ex. 17, Cardozo Aff. ¶8).

3. US Government Warnings Regarding Hacking by Hostile Foreign Governments.

85. In October of 2020 The FBI and CISA issued a JOINT CYBERSECURITY ADVISORY ON October 30, 2020 titled: **Iranian Advanced Persistent Threat Actor Identified Obtained Voter Registration Data**

> This joint cybersecurity advisory was coauthored by the Cybersecurity and Infrastructure Security Agency (CISA) and the Federal Bureau of Investigation (FBI). CISA and the FBI are aware of an Iranian advanced persistent threat (APT) actor targeting U.S. state websites to include election websites. CISA and the FBI

[6] *See* Patents Assigned to Smartmatic Corp., *available at:* https://patents.justia.com/assignee/smartmatic-corp

> assess this actor is responsible for the mass dissemination of voter intimidation emails to U.S. citizens and the dissemination of U.S. election-related disinformation in mid-October 2020.1 (Reference FBI FLASH message ME-000138-TT, disseminated October 29, 2020). Further evaluation by CISA and the FBI has identified the targeting of U.S. state election websites was an intentional effort to influence and interfere with the 2020 U.S. presidential election.
>
> (See Ex. 18, CISA and FBI Joint Cyber Security Advisory of October 30, 2020)

D. Additional Independent Findings of Dominion Flaws.

86. Further supportive of this pattern of incidents, reflecting an absence of mistake, Plaintiffs have since learned that the "glitches" in the Dominion system, that have the uniform effect of hurting Trump and helping Biden, have been widely reported in the press and confirmed by the analysis of independent experts.

1. Central Operator Can Remove, Discard or Manipulate Votes.

87. Mr. Watkins further explains **that the central operator can remove or discard batches of votes.** "After all of the ballots loaded into the scanner's feed tray have been through the scanner, the "ImageCast Central" operator will remove the ballots from the tray then have the option to either "Accept Batch" or "Discard Batch" on the scanning menu …. " (Ex. 106, Watkins aff. ¶11). ¶8.

88. Mr. Watkins further testifies that the user manual makes clear that the system allows for threshold settings to be set to find all ballots get marked as "problem ballots" for discretionary determinations on where the vote goes stating:

> 9. During the ballot scanning process, the "ImageCast Central" software will detect how much of a percent coverage of the oval was filled in by the voter. The Dominion customer determines the thresholds of which the oval needs to be covered by a mark in order to qualify as a valid vote. If a ballot has a marginal mark which did not meet the specific thresholds set by the customer, then the ballot is considered a "problem ballot" and may be set aside into a folder named "NotCastImages".

> 10. Through creatively tweaking the oval coverage threshold settings, and advanced settings on the ImageCase Central scanners, it may be possible to set thresholds in such a way that a non-trivial amount of ballots are marked "problem ballots" and sent to the "NotCastImages" folder.
>
> 11. The administrator of the ImageCast Central work station may view all images of scanned ballots which were deemed "problem ballots" by simply navigating via the standard "Windows File Explorer" to the folder named "NotCastImages" which holds ballot scans of "problem ballots". It may be possible for an administrator of the "ImageCast Central" workstation to view and delete any individual ballot scans from the "NotCastImages" folder by simply using the standard Windows delete and recycle bin functions provided by the Windows 10 Pro operating system. Id. ¶¶ 9-11.

2. Dominion – By Design – Violates Federal Election & Voting Record Retention Requirements.

89. The Dominion System put in place by its own design violates the intent of Federal law on the requirement to preserve and retain records – which clearly requires preservation of all records requisite to voting in such an election.

> **§ 20701.** Retention and preservation of records and papers by officers of elections; deposit with custodian; penalty for violation
>
> Every officer of election shall retain and preserve, for a period of twenty-two months from the date of any general, special, or primary election of which candidates for the office of President, Vice President, presidential elector, Member of the Senate, Member of the House of Representatives, or Resident Commissioner from the Commonwealth of Puerto Rico are voted for, **all records and papers which come into his possession relating to any application, registration, payment of poll tax, or other act requisite to voting in such election,** except that, when required by law, such records and papers may be delivered to another officer of election and except that, if a State or the Commonwealth of Puerto Rico designates a custodian to retain and preserve these records and papers at a specified place, then such records and papers may be deposited with such custodian, and the duty to retain and preserve any record or paper so deposited shall devolve upon such custodian. Any officer of election or custodian who willfully fails to comply with this section shall be fined not more than $1,000 or imprisoned not more than one year, or both.

See 52 USC § 20701.

3. Dominion Vulnerabilities to Hacking.

90. Plaintiffs have since learned that the "glitches" in the Dominion system -- that have the uniform effect of hurting Trump and helping Biden -- have been widely reported in the press and confirmed by the analysis of independent experts, a partial summary of which is included below.

(1) Users on the ground have full admin privileges to machines and software. The Dominion system is designed to facilitate vulnerability and allow a select few to determine which votes will be counted in any election. Workers were responsible for moving ballot data from polling place to the collector's office and inputting it into the correct folder. Any anomaly, such as pen drips or bleeds, is not counted and is handed over to a poll worker to analyze and decide if it should count. This creates massive opportunity for improper vote adjudication. (Ex. 106 Watkins aff. ¶¶8 & 11).

(2) Affiant witness (name redacted for security reasons), in his sworn testimony explains he was selected for the national security guard detail of the President of Venezuela, and that he witnessed the creation of Smartmatic for the purpose of election vote manipulation:

I was witness to the creation and operation of a sophisticated electronic voting system that permitted the leaders of the Venezuelan government to manipulate the tabulation of votes for national and local elections and select the winner of those elections in order to gain and maintain their power. Importantly, I was a direct witness to the creation and operation of an electronic voting system in a conspiracy between a company known as Smartmatic and the leaders of conspiracy with the Venezuelan government. This conspiracy specifically involved President Hugo Chavez Frias, the person in charge of the National Electoral Council named Jorge Rodriguez, and principals, representatives, and personnel from Smartmatic which included … The purpose of this conspiracy was to create and operate a voting system that could change the votes in elections from votes against persons running the Venezuelan government to votes in their favor in order to maintain control of the government. (*Id.* ¶¶6, 9, 10).

91. Specific vulnerabilities of the systems in question that have been well documented or reported include:

A. Barcodes can override the voters' vote: As one University of California, Berkeley study shows, "In all three of these machines [including

Dominion Voting Systems] the ballot marking printer is in the same paper path as the mechanism to deposit marked ballots into an attached ballot box. This opens up a very serious security vulnerability: the voting machine can make the paper ballot (to add votes or spoil already-case votes) after the last time the voter sees the paper, and then deposit that marked ballot into the ballot box without the possibility of detection." (See Ex. 2, Appel Study).

B. Voting machines were able to be connected to the internet by way of laptops that were obviously internet accessible. If one laptop was connected to the internet, the entire precinct was compromised.

C. October 6, 2006 – **Congresswoman Carolyn Maloney calls on Secretary of Treasury Henry Paulson to conduct an investigation into Smartmatic based on its foreign ownership and ties to Venezuela.** (See Ex. 15). Congresswoman Maloney wrote that "It is undisputed that Smartmatic is foreign owned and it has acquired Sequoia … Smartmatic now acknowledged that Antonio Mugica, a Venezuelan businessman has a controlling interest in Smartmatica, but the company has not revealed who all other Smartmatic owners are. *Id.*

D. Dominion "got into trouble" with several subsidiaries it used over alleged cases of fraud. One subsidiary is Smartmatic, a company "that has played a significant role in the U.S. market over the last decade."[7] Dominion entered into a 2009 contract with Smartmatic and provided Smartmatic with the PCOS machines (optical scanners) that were used in the 2010 Philippine election, the biggest automated election run by a private company. The automation of that first election in the Philippines was hailed by the international community and by the critics of the automation. The results transmission reached 90% of votes four hours after polls closed and Filipinos knew for the first time who would be their new president on Election Day. In keeping with local Election law requirements, Smartmatic and Dominion were required to provide the source code of the voting machines prior to elections so that it could be independently verified. *Id.*

E. Litigation over Smartmatic "glitches" alleges they impacted the 2010 and 2013 mid-term elections in the Philippines, raising questions of cheating and fraud. An independent review of the source codes used in the machines found multiple problems, which concluded, "The software inventory provided by Smartmatic is inadequate, … which brings into

[7] *Voting Technology Companies in the U.S. – Their Histories and Present Contributions,* Access Wire, (Aug. 10, 2017), *available at:* https://www.accesswire.com/471912/Voting-Technology-Companies-in-the-US--Their-Histories.

question the software credibility."[8]

F. Dominion acquired Sequoia Voting Systems as well as Premier Election Solutions (formerly part of Diebold, which sold Premier to ES&S in 2009, until antitrust issues forced ES&S to sell Premier, which then was acquired by Dominion). This map illustrates 2016 voting machine data—meaning, these data do not reflect geographic aggregation at the time of acquisition, but rather the machines that retain the Sequoia or Premier/Diebold brand that now fall under Dominion's market share. Penn Wharton Study at 16.

G. In late December of 2019, three Democrat Senators, Warren, Klobuchar, Wyden and House Member Mark Pocan wrote about their 'particularized concerns that secretive & "trouble -plagued companies"' "have long skimped on security in favor of convenience," in the context of how they described the voting machine systems that three large vendors – Election Systems & Software, Dominion Voting Systems, & Hart InterCivic – collectively provide voting machines & software that facilitate voting for over 90% of all eligible voters in the U.S." (See Ex. 16).

H. Senator Ron Wyden (D-Oregon) said the findings [insecurity of voting systems] are "yet another damning indictment of the profiteering election vendors, who care more about the bottom line than protecting our democracy." It's also an indictment, he said, "of the notion that important cybersecurity decisions should be left entirely to county election offices, many of whom do not employ a single cybersecurity specialist."[9]

92. The House of Representatives passed H.R. 2722 in an attempt to address these very risks on June 27, 2019:

> This bill addresses election security through grant programs and requirements for voting systems and paper ballots.
>
> The bill establishes requirements for voting systems, including that systems (1) use individual, durable, voter-verified paper ballots; (2) make

[8] *Smartmatic-TIM Running Out of Time to Fix Glitche*s, ABS-CBN News (May 4, 2010), *available at*: https://news.abs-cbn.com/nation/05/04/10/smartmatic-tim-running-out-time-fix-glitches.

> a voter's marked ballot available for inspection and verification by the voter before the vote is cast; (3) ensure that individuals with disabilities are given an equivalent opportunity to vote, including with privacy and independence, in a manner that produces a voter-verified paper ballot; (4) be manufactured in the United States; and (5) meet specified cybersecurity requirements, including the prohibition of the connection of a voting system to the internet.
>
> See H.R. 2722.

E. Because Dominion Senior Management Has Publicly Expressed Hostility to Trump and Opposition to His Election, Dominion Is Not Entitled to Any Presumption of Fairness, Objectivity or Impartiality, and Should Instead Be Treated as a Hostile Partisan Political Actor.

93. Dr. Eric Coomer is listed as the co-inventor for several patents on ballot adjudication and voting machine-related technology, all of which were assigned to Dominion.[10] He joined Dominion in 2010, and most recently served as Voting Systems Officer of Strategy and Director of Security for Dominion. Dr. Coomer first joined Sequoia Voting Systems in 2005 as Chief Software Architect and became Vice President of Engineering before Dominion Voting Systems acquired Sequoia. Dr. Coomer's patented ballot adjudication technology into Dominion voting machines sold throughout

[10] *See* "Patents by Inventor Eric Coomer," *available at:* https://patents.justia.com/inventor/eric-coomer. This page lists the following patents issued to Dr. Coomer and his co-inventors: (1) U.S. Patent No. 9,202,113, Ballot Adjudication in Voting Systems Utilizing Ballot Images (issued Dec. 1, 2015); (2) U.S. Patent No. 8,913,787, Ballot Adjudication in Voting Systems Utilizing Ballot Images (issued Dec. 16, 2014); (3) U.S. Patent No. 8,910,865, Ballot Level Security Features for Optical Scan Voting Machine Capable of Ballot Image Processing, Secure Ballot Printing, and Ballot Layout Authentication and Verification (issued Dec. 16, 2014); (4) U.S. Patent No. 8,876,002, Systems for Configuring Voting Machines, Docking Device for Voting Machines, Warehouse Support and Asset Tracking of Voting Machines (issued Nov. 4, 2014); (5) U.S. Patent No. 8,864,026, Ballot Image Processing System and Method for Voting Machines (issued Oct. 21, 2014); (6) U.S. Patent No. 8,714,450, Systems and Methods for Transactional Ballot Processing, and Ballot Auditing (issued May 6, 2014), available at: https://patents.justia.com/inventor/eric-coomer.

the United States, including those used in Wisconsin. (See attached hereto Exh 6, Jo Oltmann Aff.).

94. In 2016, Dr. Coomer admitted to the State of Illinois that Dominion Voting machines can be manipulated remotely.[11] He has also publicly posted videos explaining how Dominion voting machines can be remotely manipulated. See Id.[12]

95. Dr. Coomer has emerged as Dominion's principal defender, both in litigation alleging that Dominion rigged elections in Georgia and in the media. An examination of his previous public statements has revealed that Dr. Coomer is highly partisan and even more anti-Trump, precisely the opposite of what would expect from the management of a company charged with fairly and impartially counting votes (which is presumably why he tried to scrub his social media history). (See Id.)

96. Unfortunately for Dr. Coomer, however, a number of these posts have been captured for perpetuity. Below are quotes from some of his greatest President Trump and Trump voter hating hits to show proof of motive and opportunity. (See Id).

> If you are planning to vote for that autocratic, narcissistic, fascist ass-hat blowhard and his Christian jihadist VP pic, UNFRIEND ME NOW! No, I'm not joking. … Only an absolute F[**]KING IDIOT could ever vote for that wind-bag fuck-tard FASCIST RACIST F[**]K! … I don't give a damn if you're friend, family, or random acquaintance, pull the lever, mark an oval, touch a screen for that carnival barker … UNFRIEND ME NOW! I have no desire whatsoever to ever interact with you. You are beyond hope, beyond reason. You are controlled by fear, reaction and bullsh[*]t. Get your shit together. F[**]K YOU! Seriously, this f[**]king ass-clown stands

[11] Jose Hermosa, *Electoral Fraud: Dominion's Vice President Warned in 2016 That Vote-Counting Systems Are Manipulable*, The BL (Nov. 13, 2020), *available at*: https://thebl.com/us-news/electoral-fraud-dominions-vice-president-warned-in-2016-that-vote-counting-systems-are-manipulable.html.

[12] See, *e.g.,* "Eric Coomer Explains How to Alter Votes in the Dominion Voting System" (Nov. 24, 2020) (excerpt of presentation delivered in Chicago in 2017), *available at:* https://www.youtube.com/watch?v=UtB3tLaXLJE.

> against everything that makes this country awesome! You want in on that? You [Trump voters] deserve nothing but contempt. *Id.* (July 21, 2016 Facebook post).[13]

97. In a rare moment of perhaps unintentional honesty, Dr. Coomer anticipates this Complaint and many others, by slandering those seeking to hold election riggers like Dominion to account and to prevent the United States' descent into Venezuelan levels of voting fraud and corruption out of which Dominion was born:

> Excerpts in stunning Trump-supporter logic, "I know there is a lot of voter fraud. I don't know who is doing it, or how much is happening, but I know it is going on a lot." This beautiful statement was followed by, "It happens in third world countries, this the US, we can't let it happen here." *Id.* (October 29, 2016 Facebook post); (See also Exh. 6)

1. Dr. Coomer, who invented the technology for Dominion's voting fraud and has publicly explained how it can be used to alter votes, seems to be extremely hostile to those who would attempt to stop it and uphold the integrity of elections that underpins the legitimacy of the United States government:

> And in other news… There be some serious fuckery going on right here fueled by our Cheeto-in-Chief stoking lie after lie on the flames of [Kris] Kobach… [Linking Washington Post article discussing the Presidential Advisory Commission on Election Integrity, of which former Kansas Secretary of State Kris Kobach was a member, entitled, "The voting commission is a fraud itself. Shut it down."] *Id.* (September 14, 2017 Facebook post.] (Id.)

98. Dr. Coomer also keeps good company, supporting and reposting ANTIFA statements slandering President Trump as a "fascist" and by extension his supporters, voters and the United States military (which he claims, without evidence, Trump will make into a "fascist tool"). *Id.* (June 2, 2020 Facebook post). Lest someone claims that these

[13] In this and other quotations from Dr. Coomer's social media, Plaintiffs have redacted certain profane terms.

are "isolated statements" "taken out of context", Dr. Coomer has affirmed that he shares ANTIFA's taste in music and hatred of the United States of America, *id.* (May 31, 2020 Facebook post linking "F[**]k the USA" by the exploited), and the police. *Id.* (separate May 31, 2020 Facebook posts linking N.W.A. "F[**]k the Police" and a post promoting phrase "Dead Cops"). *Id.* at 4-5.

99. Affiant and journalist Joseph Oltmann researched ANTIFA in Colorado. *Id.* at 1. "On or about the week of September 27, 2020," he attended an Antifa meeting which appeared to be between Antifa members in Colorado Springs and Denver Colorado," where Dr. Coomer was present. In response to a question as to what Antifa would do "if Trump wins this … election?", Dr. Coomer responded "Don't worry about the election. Trump is not going to win. I made f[**]king sure of that … Hahaha." *Id.* at 2.

100. By putting an anti-Trump zealot like Dr. Coomer in charge of election "Security," and using his technology for what should be impartial "ballot adjudication," Dominion has given the fox the keys to the hen house ***and has forfeited any presumption of objectivity, fairness, or even propriety***. It appears that Dominion does not care about even an appearance of impropriety, as its most important officer has his fingerprints all over a highly partisan, vindictive, and personal vendetta against the Republican nominee both in 2016 and 2020, President Donald Trump. Dr. Coomer's highly partisan anti-Trump rages show clear motive on the part of Dominion to rig the election in favor of Biden, and may well explain why for each of the so-called "glitches" uncovered, it is always Biden receiving the most votes on the favorable end of such a "glitch." (Id.)

101. In sum, as set forth above, for a host of independent reasons, the Wisconsin election results concluding that Joe Biden received 20,608 more votes that President

Donald Trump must be set aside.

COUNT I

Defendants Violated the Elections and Electors Clauses and 42 U.S.C. § 1983.

102. Plaintiffs reallege all preceding paragraphs as if fully set forth herein.

103. The Electors Clause states that "[e]ach State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors" for President. U.S. Const. art. II, §1, cl. 2 (emphasis added). Likewise, the Elections Clause of the U.S. Constitution states that "[t]he Times, Places, and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by *the Legislature* thereof." U.S. Const. art. I, § 4, cl. 1 (emphasis added).

104. The Legislature is "'the representative body which ma[kes] the laws of the people.'" *Smiley v. Holm,* 285 U.S. 355, 365 (1932). Regulations of congressional and presidential elections, thus, "must be in accordance with the method which the state has prescribed for legislative enactments." *Id.* at 367; *see also Ariz. State Legislature v. Ariz. Indep. Redistricting Comm'n*, 135 S. Ct. 2652, 2668 (2015).

105. Defendants are not part of the Wisconsin Legislature and cannot exercise legislative power. Because the United States Constitution reserves for the Wisconsin Legislature the power to set the time, place, and manner of holding elections for the President and Congress, county boards of elections and state executive officers have no authority to unilaterally exercise that power, much less to hold them in ways that conflict with existing legislation.

106. Section I details three separate instances where Defendants violated the Wisconsin Election Code. First, the WEC May 23, 2020 "guidance", see Ex. 16, on the treatment of "indefinitely confined" voters, who are exempt from Wisconsin's photo ID

requirement for absentee ballot application, that directly contravened the express requirement in Wisconsin Election Code that clerks "shall" remove an allegedly "indefinitely confined" voter if the clerk has "reliable information" that that voter is not, or is no longer, "indefinitely confined." Second, the WEC's October 18, 2016, see Ex. 18, directed clerks to violate the express requirements of Wisconsin Statutes § 6.87(6)(d), which states "[i]f a certificate is missing the address of a witness the ballot may not be counted," when it directed clerks to fill in missing information on absentee ballot envelopes. Third, WEC and Wisconsin election officials violated Wisconsin Election Code, or acted *ultra vires*, insofar as they filled in missing witness or voter information on absentee ballots and permitted voters to cure ballots without statutory authorization. Section II provides expert witness testimony quantifying the number of illegal or ineligible ballots that were counted, and lawful ballots that were not, as a result of these and Defendants' other violations.

107. A report from Dr. William Briggs, shows that there were approximately 29,594 absentee ballots listed as "unreturned" by voters that either never requested them, or that requested and returned their ballots.

108. Evidence compiled by Matt Braynard using the National Change of Address ("NCOA") Database shows that 6,207 Wisconsin voters in the 2020 General Election moved out-of-state prior to voting, and therefore were ineligible. Mr. Braynard also identified 765 Wisconsin voters who subsequently registered to vote in another state and were therefore ineligible to vote in the 2020 General Election. The merged number is 6,966 ineligible voters whose votes must be removed from the total for the 2020 General Election.

109. Plaintiffs have no adequate remedy at law and will suffer serious and irreparable

harm unless the injunctive relief requested herein is granted. Defendants have acted and, unless enjoined, will act under color of state law to violate the Elections Clause.

110. Accordingly, the results for President in the November 3, 2020 election must be set aside, the State of Wisconsin should be enjoined from transmitting the certified the results thereof, and this Court should grant the other declaratory and injunctive relief requested herein.

COUNT II

Governor Evers and Other Defendants Violated The Equal Protection Clause of the Fourteenth Amendment U.S. Const. Amend. XIV & 42 U.S.C. § 1983

Invalid Enactment of Regulations & Disparate Treatment of Absentee vs. Mail-In Ballots

111. Plaintiffs refer to and incorporate by reference each of the prior paragraphs of this Complaint as though the same were repeated at length herein.

112. The Fourteenth Amendment of the United States Constitution provides "nor shall any state deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws. *See also Bush v. Gore*, 531 U.S. 98, 104 (2000) (having once granted the right to vote on equal terms, the State may not, by later arbitrary and disparate treatment, value one person's vote over the value of another's). *Harper v. Va. Bd. of Elections*, 383 U.S. 663, 665 (1966) ("Once the franchise is granted to the electorate, lines may not be drawn which are inconsistent with the Equal Protection Clause of the Fourteenth Amendment."). The Court has held that to ensure equal protection, a problem inheres in the absence of specific standards to ensure its equal application. *Bush*, 531 U.S. at 106 ("The formulation of uniform rules to determine intent based on these recurring circumstances is practicable and, we conclude,

necessary.”).

113. The equal enforcement of election laws is necessary to preserve our most basic and fundamental rights. The requirement of equal protection is particularly stringently enforced as to laws that affect the exercise of fundamental rights, including the right to vote.

114. The disparate treatment of Wisconsin voters, in subjecting one class of voters to greater burdens or scrutiny than another, violates Equal Protection guarantees because “the right of suffrage can be denied by a debasement or dilution of the weight of a citizen’s vote just as effectively as by wholly prohibiting the free exercise of the franchise.” *Reynolds*, 377 U.S. at 555. *Rice v. McAlister*, 268 Ore. 125, 128, 519 P.2d 1263, 1265 (1975); *Heitman v. Brown Grp., Inc.,* 638 S.W.2d 316, 319, 1982 Mo. App. LEXIS 3159, at *4 (Mo. Ct. App. 1982); *Prince v. Bear River Mut. Ins. Co.*, 2002 UT 68, ¶ 41, 56 P.3d 524, 536-37 (Utah 2002).

115. In statewide and federal elections conducted in the State of Wisconsin, including without limitation the November 3, 2020 General Election, all candidates, political parties, and voters, including without limitation Plaintiffs, in having the election laws enforced fairly and uniformly.

116. As set forth in Section I above, Defendants failed to comply with the requirements of the Wisconsin Election Code and thereby diluted the lawful ballots of the Plaintiffs and of other Wisconsin voters and electors in violation of the United States Constitution guarantee of Equal Protection. Further, Defendants enacted regulations, or issued guidance, that had the intent and effect of favoring one class of voters – Democratic absentee voters – over Republican voters. Further, all of these invalidly enacted rules by Defendant Wisconsin executive and administrative agencies, had the intent and effect of

eliminating protections against voter fraud, and thereby enabled and facilitated the counting of fraudulent, unlawful and ineligible votes, which were quantified in Section II. Finally, Section III details the additional voting fraud and manipulation enabled by the use Dominion voting machines, which had the intent and effect of favoring Biden and Democratic voters and discriminating against Trump and Republican voters.

117. Defendants have acted and will continue to act under color of state law to violate Plaintiffs' right to be present and have actual observation and access to the electoral process as secured by the Equal Protection Clause of the United States Constitution. Defendants thus failed to conduct the general election in a uniform manner as required by the Equal Protection Clause of the Fourteenth Amendment, the corollary provisions of the Wisconsin Constitution, and the Wisconsin Election Code.

118. Plaintiffs seek declaratory and injunctive relief forbidding Defendants from certifying a tally that includes any ballots that were not legally cast, or that were switched from Trump to Biden through the unlawful use of Dominion Democracy Suite software and devices.

119. The Briggs analysis identified two specific errors involving unreturned mail-in ballots that are indicative of voter fraud, namely: "**Error #1:** those who were recorded as receiving absentee ballots ***without*** requesting them;" and "**Error #2:** those who returned absentee ballots but whose votes went missing (*i.e.*, marked as unreturned)." Clearly the dilution of lawful votes violates the Equal Protection clause; and the counting of unlawful votes violates the rights of lawful Citizens.

120. In addition, Plaintiffs ask this Court to order that no ballot processed by a counting board in the Wisconsin Counties can be included in the final vote tally unless a challenger

was allowed to meaningfully observe the process and handling and counting of the ballot, or that were unlawfully switched from Trump to Biden.

121. Plaintiffs have no adequate remedy at law and will suffer serious and irreparable harm unless the declaratory and injunctive relief requested herein is granted. Indeed, the setting aside of an election in which the people have chosen their representative is a drastic remedy that should not be undertaken lightly, but instead should be reserved for cases in which a person challenging an election has clearly established a violation of election procedures and has demonstrated that the violation has placed the result of the election in doubt. Wisconsin law allows elections to be contested through litigation, both as a check on the integrity of the election process and as a means of ensuring the fundamental right of citizens to vote and to have their votes counted accurately.

COUNT III

Fourteenth Amendment, Amend. XIV & 42 U.S.C. § 1983

Denial of Due Process On The Right to Vote

122. Plaintiffs refer to and incorporate by reference each of the prior paragraphs of this Complaint as though the same were repeated at length herein.

123. The right of qualified citizens to vote in a state election involving federal candidates is recognized as a fundamental right under the Fourteenth Amendment of the United States Constitution. *Harper,* 383 U.S. at 665. *See also Reynolds*, 377 U.S. at 554 (The Fourteenth Amendment protects the "the right of all qualified citizens to vote, in state as well as in federal elections."). Indeed, ever since the Slaughter-House Cases, 83 U.S. 36 (1873), the United States Supreme Court has held that the Privileges or Immunities Clause of the Fourteenth Amendment protects certain rights of federal

citizenship from state interference, including the right of citizens to directly elect members of Congress. *See Twining v. New Jersey*, 211 U.S. 78, 97 (1908) (*citing Ex parte Yarbrough*, 110 U.S. 651, 663-64 (1884)). *See also Oregon v. Mitchell*, 400 U.S. 112, 148-49 (1970) (Douglas, J., concurring) (collecting cases).

124. The fundamental right to vote protected by the Fourteenth Amendment is cherished in our nation because it "is preservative of other basic civil and political rights." *Reynolds*, 377 U.S. at 562. Voters have a "right to cast a ballot in an election free from the taint of intimidation and fraud," *Burson v. Freeman*, 504 U.S. 191, 211 (1992), and "[c]onfidence in the integrity of our electoral processes is essential to the functioning of our participatory democracy." *Purcell v. Gonzalez*, 549 U.S. 1, 4 (2006) (per curiam).

125. "Obviously included within the right to [vote], secured by the Constitution, is the right of qualified voters within a state to cast their ballots and have them counted" if they are validly cast. *United States v. Classic*, 313 U.S. 299, 315 (1941). "[T]he right to have the vote counted" means counted "at full value without dilution or discount." *Reynolds*, 377 U.S. at 555, n.29 (*quoting South v. Peters*, 339 U.S. 276, 279 (1950) (Douglas, J., dissenting)).

126. "Every voter in a federal . . . election, whether he votes for a candidate with little chance of winning or for one with little chance of losing, has a right under the Constitution to have his vote fairly counted, without its being distorted by fraudulently cast votes." *Anderson v. United States*, 417 U.S. 211, 227 (1974); *see also Baker v. Carr*, 369 U.S. 186, 208 (1962). Invalid or fraudulent votes "debase[]" and "dilute" the weight of each validly cast vote. *See Anderson*, 417 U.S. at 227.

127. The right to vote includes not just the right to cast a ballot, but also the right to have it

fairly counted if it is legally cast. The right to vote is infringed if a vote is cancelled or diluted by a fraudulent or illegal vote, including without limitation when a single person votes multiple times. The Supreme Court of the United States has made this clear in case after case. *See, e.g., Gray v. Sanders*, 372 U.S. 368, 380 (1963) (every vote must be "protected from the diluting effect of illegal ballots."); *Crawford v. Marion Cnty. Election Bd.*, 553 U.S. 181, 196 (2008) (plurality op. of Stevens, J.) ("There is no question about the legitimacy or importance of the State's interest in counting only the votes of eligible voters."); *accord Reynolds v. Sims*, 377 U.S. 533, 554-55 & n.29 (1964).

128. The right to an honest [count] is a right possessed by each voting elector, and to the extent that the importance of his vote is nullified, wholly or in part, he has been injured in the free exercise of a right or privilege secured to him by the laws and Constitution of the United States." *Anderson*, 417 U.S. at 226 (*quoting Prichard v. United States*, 181 F.2d 326, 331 (6th Cir.), *aff'd due to absence of quorum*, 339 U.S. 974 (1950)).

129. Practices that promote the casting of illegal or unreliable ballots or fail to contain basic minimum guarantees against such conduct, can violate the Fourteenth Amendment by leading to the dilution of validly cast ballots. See *Reynolds*, 377 U.S. at 555 ("[T]he right of suffrage can be denied by a debasement or dilution of the weight of a citizen's vote just as effectively as by wholly prohibiting the free exercise of the franchise.").

130. Section I details the Defendants violations of the Wisconsin Election Code. Section II provides estimates of the number of fraudulent, illegal or ineligible votes counted, and demonstrates that this number is many times larger than Biden's margin of victory.

131. Plaintiffs seek declaratory and injunctive relief enjoining Defendants from

certifying the results of the General Election, or in the alternative, conduct a recount or recanvas in which they allow a reasonable number of challengers to meaningfully observe the conduct of the Wisconsin Board of State Canvassers and the Wisconsin county Boards of Canvassers and that these canvassing boards exercise their duty and authority under Wisconsin law, which forbids certifying a tally that includes any ballots that were not legally cast, or that were switched from Trump to Biden through the unlawful use of Dominion Democracy Suite software and devices.

COUNT IV

Wide-Spread Ballot Fraud

132. Plaintiffs reallege all preceding paragraphs as if fully set forth herein.

133. The scheme of civil fraud can be shown with the pattern of conduct that includes motive and opportunity, as exhibited by the high level official at Dominion Voting Systems, Eric Coomer, and his visceral and public rage against the current U.S. President.

134. Opportunity appears with the secretive nature of the voting source code, and the feed of votes that make clear that an algorithm is applied, that reports in decimal points despite the law requiring one vote for one ballot.

135. The results of the analysis and the pattern seen in the included graph strongly suggest a systemic, system-wide algorithm was enacted by an outside agent, causing the results of Wisconsin's vote tallies to be inflated by somewhere between 3 and 5.6 percentage points. Statistical estimating yields that in Wisconsin, the best estimate of the number of impacted votes is 181,440. *Id.*

136. The Reports cited above show a total amount of illegal votes identified that amount to 318,012 or over 15 times the margin by which candidate Biden leads President Trump in the state

of Wisconsin.

137. The right to vote includes not just the right to cast a ballot, but also the right to have it fairly counted if it is legally cast. The right to vote is infringed if a vote is cancelled or diluted by a fraudulent or illegal vote, including without limitation when a single person votes multiple times. The Supreme Court of the United States has made this clear in case after case. See, e.g., *Gray v. Sanders*, 372 U.S. 368, 380 (1963) (every vote must be "protected from the diluting effect of illegal ballots."); *Crawford v. Marion Cnty. Election Bd.*, 553 U.S. 181, 196 (2008) (plurality op. of Stevens, J.) ("There is no question about the legitimacy or importance of the State's interest in counting only the votes of eligible voters."); *accord Reynolds v. Sims*, 377 U.S. 533, 554-55 & n.29 (1964).

138. Plaintiffs have no adequate remedy at law. Plaintiffs contest the results of Wisconsin's 2020 General Election because it is fundamentally corrupted by fraud. Defendants intentionally violated multiple provisions of the Wisconsin Election Code to elect Biden and other Democratic candidates and defeat President Trump and other Republican candidates.

PRAYER FOR RELIEF

139. Accordingly, Plaintiffs seek an emergency order instructing Defendants to de-certify the results of the General Election for the Office of President.

140. Alternatively, Plaintiffs seek an order instructing the Defendants to certify the results of the General Election for Office of the President in favor of President Donald Trump.

141. In the alternative, Plaintiffs seek an emergency order prohibiting Defendants from including in any certified results from the General Election the tabulation of absentee and mailing ballots which do not comply with the Wisconsin Election Code, including, without limitation, the tabulation of absentee and mail-in ballots Trump Campaign's watchers were prevented from

observing or based on the tabulation of invalidly cast absentee and mail-in ballots which (i) lack a secrecy envelope, or contain on that envelope any text, mark, or symbol which reveals the elector's identity, political affiliation, or candidate preference, (ii) do not include on the outside envelope a completed declaration that is dated and signed by the elector, (iii) are delivered in-person by third parties for non-disabled voters, or (iv) any of the other Wisconsin Election Code violations set forth in Section II of this Complaint.

142. Order production of all registration data, ballot applications, ballots, envelopes, etc. required to be maintained by law. When we consider the harm of these uncounted votes, and ballots not ordered by the voters themselves, and the potential that many of these unordered ballots may in fact have been improperly voted and also prevented proper voting at the polls, the mail ballot system has clearly failed in the state of Wisconsin and did so on a large scale and widespread basis. The size of the voting failures, whether accidental or intentional, are multiples larger than the margin in the state. For these reasons, Wisconsin cannot reasonably rely on the results of the mail vote. Relief sought is the elimination of the mail ballots from counting in the 2020 election. Alternatively, the electors for the State of Wisconsin should be disqualified from counting toward the 2020 election. Alternatively, the electors of the State of Wisconsin should be directed to vote for President Donald Trump.

143. For these reasons, Plaintiffs ask this Court to enter a judgment in their favor and provide the following emergency relief:

1. An order directing Governor Evers and the Wisconsin Elections Commission to de-certify the election results;

2. An order enjoining Governor Evers from transmitting the currently certified election results the Electoral College;

3. An order requiring Governor Evers to transmit certified election results that state that President Donald Trump is the winner of the election;

4. An immediate emergency order to seize and impound all servers, software, voting machines, tabulators, printers, portable media, logs, ballot applications, ballot return envelopes, ballot images, paper ballots, and all "election materials" referenced in Wisconsin Statutes § 9.01(1)(b)11. related to the November 3, 2020 Wisconsin election for forensic audit and inspection by the Plaintiffs;

5. An order that no votes received or tabulated by machines that were not certified as required by federal and state law be counted;

6. A declaratory judgment declaring that Wisconsin's failed system of signature verification violates the Electors and Elections Clause by working a de facto abolition of the signature verification requirement;

7. A declaratory judgment declaring that currently certified election results violate the Due Process Clause, U.S. CONST. Amend. XIV;

8. A declaratory judgment declaring that mail-in and absentee ballot fraud must be remedied with a Full Manual Recount or statistically valid sampling that properly verifies the signatures on absentee ballot envelopes and that

invalidates the certified results if the recount or sampling analysis shows a sufficient number of ineligible absentee ballots were counted;

9. A declaratory judgment declaring absentee ballot fraud occurred in violation of Constitutional rights, Election laws and under state law;

10. A permanent injunction prohibiting the Governor and Secretary of State from transmitting the currently certified results to the Electoral College based on the overwhelming evidence of election tampering;

11. Immediate production of 48 hours of security camera recording of all rooms used in the voting process at the TCF Center for November 3, 2020 and November 4, 2020.

12. Plaintiffs further request the Court grant such other relief as is just and proper, including but not limited to, the costs of this action and their reasonable attorney fees and expenses pursuant to 42 U.S.C. 1988.

Respectfully submitted, this 1st day of December, 2020.

DECLARATION OF [redacted]

I, [redacted], hereby state the following:

1. [redacted]

2. I am an adult of sound mine. All statements in this declaration are based on my personal knowledge and are true and correct.

3. I am making this statement voluntarily and on my own initiative. I have not been promised, nor do I expect to receive, anything in exchange for my testimony and giving this statement. I have no expectation of any profit or reward and understand that there are those who may seek to harm me for what I say in this statement. I have not participated in any political process in the United States, have not supported any candidate for office in the United States, am not legally permitted to vote in the United States, and have never attempted to vote in the United States.

4. I want to alert the public and let the world know the truth about the corruption, manipulation, and lies being committed by a conspiracy of people and companies intent upon betraying the honest people of the United States and their legally constituted institutions and fundamental rights as citizens. This conspiracy began more than a decade ago in Venezuela and has spread to countries all over the world. It is a conspiracy to wrongfully gain and keep power and wealth. It involves political leaders, powerful companies, and other persons whose purpose is to gain and keep power by changing the free will of the people and subverting the proper course of governing.

5. [redacted] Over the course of my career, I specialized in the marines [redacted]

6. Due to my training in special operations and my extensive military and academic formations, I was selected for the national security guard detail of the President of Venezuela. [redacted]

[redacted]

7. [redacted] Señor Cabello was a long-time confederate of President Chavez and instrumental in his gaining power. In 2002, Señor Cabello had very briefly taken over the duties of the presidency while Hugo Chavez was imprisoned. Within hours of Señor Cabello taking over the presidency, Hugo Chavez was released from prison and regained the office of President. On December 11, 2011, Cabello was installed as the Vice-President of the United Socialist Party – the party of President Chávez and became the second most powerful figure in the party after Hugo Chávez. Cabello was appointed president of the National Assembly in early 2012 and was re-elected to that post in January 2013. After Hugo Chávez's death, Cabello was next in line for the presidency of the country, but he remained president of the National Assembly and yielded to Nicolás Maduro holding the position of President of Venezuela.

8. [redacted] President Chavez was very precise and exacting in his instructions in the details about meetings he wanted, where the meeting was to occur, who was to attend, what was to be done. [redacted]

9. [redacted] I was witness to the creation and operation of a

sophisticated electronic voting system that permitted the leaders of the Venezuelan government to manipulate the tabulation of votes for national and local elections and select the winner of those elections in order to gain and maintain their power.

10. Importantly, I was a direct witness to the creation and operation of an electronic voting system in a conspiracy between a company known as Smartmatic and the leaders of conspiracy with the Venezuelan government. This conspiracy specifically involved President Hugo Chavez Frias, the person in charge of the National Electoral Council named Jorge Rodriguez, and principals, representatives, and personnel from Smartmatic which included [redacted]. The purpose of this conspiracy was to create and operate a voting system that could change the votes in elections from votes *against* persons running the Venezuelan government to votes *in their favor* in order to maintain control of the government.

11. In mid-February of 2009, there was a national referendum to change the Constitution of Venezuela to end term limits for elected officials, including the President of Venezuela. The referendum passed. This permitted Hugo Chavez to be re-elected an unlimited number of times.

12. After passage of the referendum, President Chavez instructed me to make arrangements for him to meet with Jorge Rodriguez, then President of the National Electoral Council, and three executives from Smartmatic. Among the three Smartmatic representatives were [redacted] President Chavez had multiple meetings with Rodriguez and the Smartmatic team at which I was present. In the first of four meetings, Jorge Rodriguez promoted the idea to create software that would manipulate elections. Chavez was very excited and made it clear that he would provide whatever Smartmatic needed. He wanted them immediately to create a voting system which would ensure that any time anything was going to be voted on the voting system would guarantee results that Chavez wanted. Chavez offered Smartmatic many inducements, including large sums of money, for Smartmatic to create or modify the voting system so that it would guarantee Chavez would win every election cycle. Smartmatic's team agreed to create such a system and did so.

13. I arranged and attended three more meetings between President Chavez and the representatives from Smartmatic at which details of the new

voting system were discussed and agreed upon. For each of these meetings, I communicated directly with [redacted] on details of where and when to meet, where the participants would be picked up and delivered to the meetings, and what was to be accomplished. At these meetings, the participants called their project the "Chavez revolution." From that point on, Chavez never lost any election. In fact, he was able to ensure wins for himself, his party, Congress persons and mayors from townships.

14. Smartmatic's electoral technology was called "Sistema de Gestión Electoral" (the "Electoral Management System"). Smartmatic was a pioneer in this area of computing systems. Their system provided for transmission of voting data over the internet to a computerized central tabulating center. The voting machines themselves had a digital display, fingerprint recognition feature to identify the voter, and printed out the voter's ballot. The voter's thumbprint was linked to a computerized record of that voter's identity. Smartmatic created and operated the entire system.

15. Chavez was most insistent that Smartmatic design the system in a way that the system could change the vote of each voter without being detected. He wanted the software itself to function in such a manner that if the voter were to place their thumb print or fingerprint on a scanner, then the thumbprint would be tied to a record of the voter's name and identity as having voted, but that voter would not tracked to the changed vote. He made it clear that the system would have to be setup to not leave any evidence of the changed vote for a specific voter and that there would be no evidence to show and nothing to contradict that the name or the fingerprint or thumb print was going with a changed vote. Smartmatic agreed to create such a system and produced the software and hardware that accomplished that result for President Chavez.

16. After the Smartmatic Electoral Management System was put in place, I closely observed several elections where the results were manipulated using Smartmatic software. One such election was in December 2006 when Chavez was running against Rosales. Chavez won with a landslide over Manuel Rosales - a margin of nearly 6 million votes for Chavez versus 3.7 million for Rosales.

17. On April 14, 2013, I witnessed another Venezuelan national election in which the Smartmatic Electoral Management System was used to manipulate and change the results for the person to succeed Hugo Chávez

as President. In that election, Nicolás Maduro ran against Capriles Radonsky. [redacted] Inside that location was a control room in which there were multiple digital display screens – TV screens – for results of voting in each state in Venezuela. The actual voting results were fed into that room and onto the displays over an internet feed, which was connected to a sophisticated computer system created by Smartmatic. People in that room were able to see in "real time" whether the vote that came through the electronic voting system was in their favor or against them. If one looked at any particular screen, they could determine that the vote from any specific area or as a national total was going against either candidate. Persons controlling the vote tabulation computer had the ability to change the reporting of votes by moving votes from one candidate to another by using the Smartmatic software.

18. By two o'clock in the afternoon on that election day Capriles Radonsky was ahead of Nicolás Maduro by two million votes. When Maduro and his supporters realized the size of Radonsky's lead they were worried that they were in a crisis mode and would lose the election. The Smartmatic machines used for voting in each state were connected to the internet and reported their information over the internet to the Caracas control center in real-time. So, the decision was made to reset the entire system. Maduro's and his supporters ordered the network controllers to take the internet itself offline in practically all parts in Venezuela and to change the results.

19. It took the voting system operators approximately two hours to make the adjustments in the vote from Radonsky to Maduro. Then, when they turned the internet back on and the on-line reporting was up and running again, they checked each screen state by state to be certain where they could see that each vote was changed in favor of Nicholas Maduro. At that moment the Smartmatic system changed votes that were for Capriles Radonsky to Maduro. By the time the system operators finish, they had achieved a convincing, but narrow victory of 200,000 votes for Maduro.

20. After Smartmatic created the voting system President Chavez wanted, he exported the software and system all over Latin America. It was sent to Bolivia, Nicaragua, Argentina, Ecuador, and Chile – countries that were in alliance with President Chavez. This was a group of leaders who wanted to be able to guarantee they maintained power in their countries. When Chavez died, Smartmatic was in a position of being the only

company that could guarantee results in Venezuelan elections for the party in power.

21. I want to point out that the software and fundamental design of the electronic electoral system and software of Dominion and other election tabulating companies relies upon software that is a descendant of the Smartmatic Electoral Management System. In short, the Smartmatic software is in the DNA of every vote tabulating company's software and system.

22. Dominion is one of three major companies that tabulates votes in the United States. Dominion uses the same methods and fundamentally same software design for the storage, transfer and computation of voter identification data and voting data. Dominion and Smartmatic did business together. The software, hardware and system have the same fundamental flaws which allow multiple opportunities to corrupt the data and mask the process in a way that the average person cannot detect any fraud or manipulation. The fact that the voting machine displays a voting result that the voter intends and then prints out a paper ballot which reflects that change does not matter. It is the software that counts the digitized vote and reports the results. The software itself is the one that changes the information electronically to the result that the operator of the software and vote counting system intends to produce that counts. That's how it is done. So the software, the software itself configures the vote and voting result -- changing the selection made by the voter. The software decides the result regardless of what the voter votes.

23. All of the computer controlled voting tabulation is done in a closed environment so that the voter and any observer cannot detect what is taking place unless there is a malfunction or other event which causes the observer to question the process. I saw first-hand that the manipulation and changing of votes can be done in real-time at the secret counting center which existed in Caracas, Venezuela. For me it was something very surprising and disturbing. I was in awe because I had never been present to actually see it occur and I saw it happen. So, I learned first-hand that it doesn't matter what the voter decides or what the paper ballot says. It's the software operator and the software that decides what counts – not the voter.

24. If one questions the reliability of my observations, they only have to read the words of [redacted] a time period in

which Smartmatic had possession of all the votes and the voting, the votes themselves and the voting information at their disposition in Venezuela. [redacted] he was assuring that the voting system implemented or used by Smartmatic was completely secure, that it could not be compromised, was not able to be altered.

25. But later, in 2017 when there were elections where Maduro was running and elections for legislators in Venezuela, [redacted] and Smartmatic broke their secrecy pact with the government of Venezuela. He made a public announcement through the media in which he stated that all the Smartmatic voting machines used during those elections were totally manipulated and they were manipulated by the electoral council of Venezuela back then. [redacted] stated that all of the votes for Nicholas Maduro and the other persons running for the legislature were manipulated and they actually had lost. So I think that's the greatest proof that the fraud can be carried out and will be denied by the software company that [redacted] admitted publicly that Smartmatic had created, used and still uses vote counting software that can be manipulated or altered.

26. I am alarmed because of what is occurring in plain sight during this 2020 election for President of the United States. The circumstances and events are eerily reminiscent of what happened with Smartmatic software electronically changing votes in the 2013 presidential election in Venezuela. What happened in the United States was that the vote counting was abruptly stopped in five states using Dominion software. At the time that vote counting was stopped, Donald Trump was significantly ahead in the votes. Then during the wee hours of the morning, when there was no voting occurring and the vote count reporting was off-line, something significantly changed. When the vote reporting resumed the very next morning there was a very pronounced change in voting in favor of the opposing candidate, Joe Biden.

27. [redacted] I have worked in gathering information, researching, and working with information technology. That's what I know how to do and the special knowledge that I have. Due to these recent election events, I contacted a number of reliable and intelligent ex-co-workers of mine that are still informants and work with the intelligence community. I asked for them to give me information that was up-to-date information in as far as how all these businesses are acting, what actions they are taking.

I declare under penalty of perjury that the foregoing is true and correct and that this Declaration was prepared in Dallas County, State of Texas, and executed on November 15, 2020.

[redacted]

An Analysis of Surveys Regarding Absentee Ballots Across Several States

William M. Briggs

November 23, 2020

1 Summary

Survey data was collected from individuals in several states, sampling those who the states listed as not returning absentee ballots. The data was provided by Matt Braynard.

The survey asked respondents whether they (a) had ever requested an absentee ballot, and, if so, (b) whether they had in fact returned this ballot. From this sample I produce predictions of the total numbers of: **Error #1**, those who were recorded as receiving absentee ballots *without* requesting them; and **Error #2**, those who returned absentee ballots but whose votes went missing (i.e. marked as unreturned).

The sizes of both errors were large in each state. The states were Georgia, Michigan, Wisconsin, and Arizona where ballots were across parties. Pennsylvania data was for Republicans only.

2 Analysis Description

Each analysis was carried out separately for each state. The analysis used (a) the number of absentee ballots recorded as unreturned, (b) the total responding to the survey, (c) the total of those saying they did not request a ballot, (d) the total of those saying they did request a ballot, and of these (e) the number saying they returned their ballots. I assume survery respondents are representative and the data is accurate.

From these data a simple parameter-free predictive model was used to calculate the probability of all possible outcomes. Pictures of these probabilities were derived, and the 95% prediction interval of the relevant numbers was calculated. The pictures appear in the Appendix at the end. They are summarized here with their 95% prediction intervals.

Error #1: being recorded as sent an absentee ballot without requesting one.

Error #2: sending back an absentee ballot and having it recorded as not returned.

State	Unreturned ballots	Error #1	Error #2
Georgia	138,029	16,938–22,771	31,559–38,866
Michigan	139,190	29,611–36,529	27,928–34,710
Pennsylvania*	165,412	32,414–37,444	26,954–31,643
Wisconsin	96,771	16,316–19,273	13,991–16,757
Arizona	518,560	208,333–229,937	78,714–94,975

*Number for Pennsylvania represent Republican ballots only.

Ballots that were not requested, and ballots returned and marked as not returned were classed as *troublesome*. The estimated average number of troublesome ballots for each state were then calculated using the table above and are presented next.

State	Unreturned ballots	Estimated average troublesome ballots	Percent
Georgia	138,029	53,489	39%
Michigan	139,190	62,517	45%
Pennsylvania*	165,412	61,780	37%
Wisconsin	96,771	29,594	31%
Arizona	518,560	303,305	58%

*Number for Pennsylvania represent Republican ballots only.

3 Conclusion

There are clearly a large number of troublesome ballots in each state investigated. Ballots marked as not returned that were never requested are clearly an error of some kind. The error is not small as a percent of the total recorded unreturned ballots.

Ballots sent back and unrecorded is a separate error. These represent votes that have gone missing, a serious mistake. The number of these missing ballots is also large in each state.

Survey respondents were not asked if they received an unrequested ballot whether they sent these ballots back. This is clearly a lively possibility, and represents a third possible source of error, including the potential of voting twice (once by absentee and once at the polls). No estimates or likelihood can be calculated for this potential error due to absence of data.

4 Declaration of William M. Briggs, PhD

1. My name is William M. Briggs. I am over 18 years of age and am competent to testify in this action. All of the facts stated herein are true and based on my personal knowledge.
2. I received a Ph.D of Statistics from Cornell University in 2004.
3. I am currently a statistical consultant. I make this declaration in my personal capacity.
4. I have analyzed data regarding responses to questions relating to mail ballot requests, returns and related issues.
5. I attest to a reasonable degree of professional certainty that the resulting analysis are accurate.

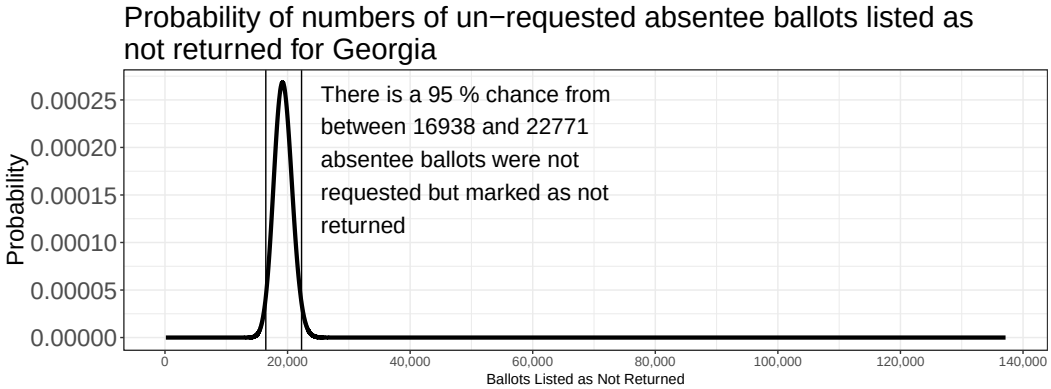
I declare under the penalty of perjury that the foregoing is true and correct.

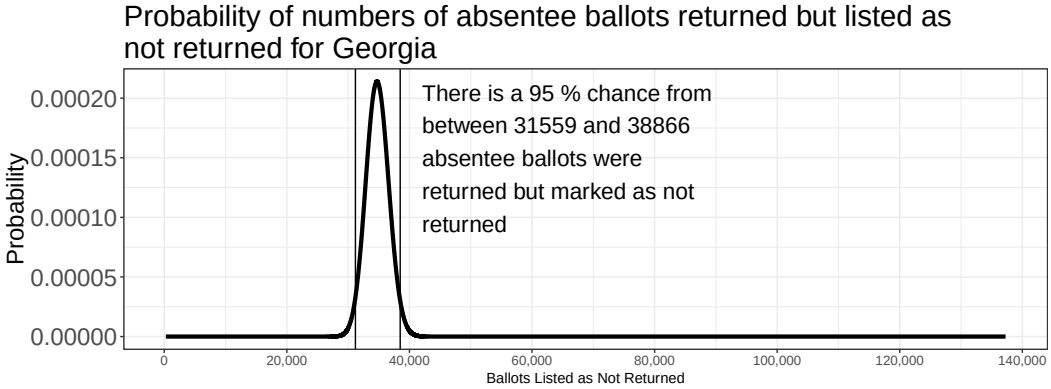
23 November 2020

William M. Briggs

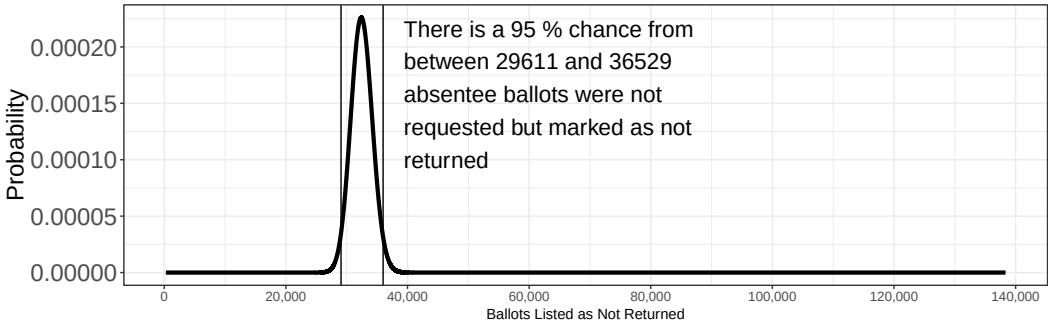
5 Appendix

The probability pictures for each state for each outcome as mentioned above.

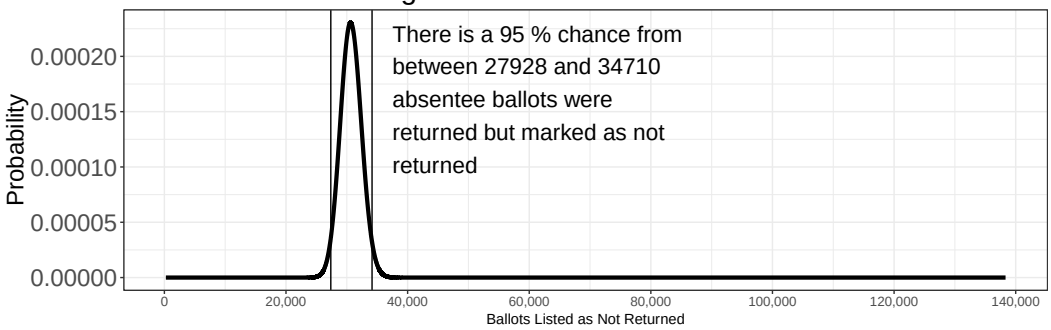




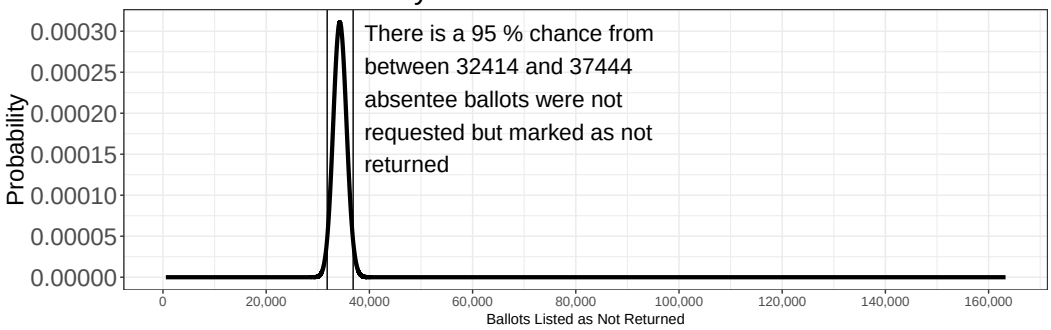
Probability of numbers of un−requested absentee ballots listed as not returned for Michigan



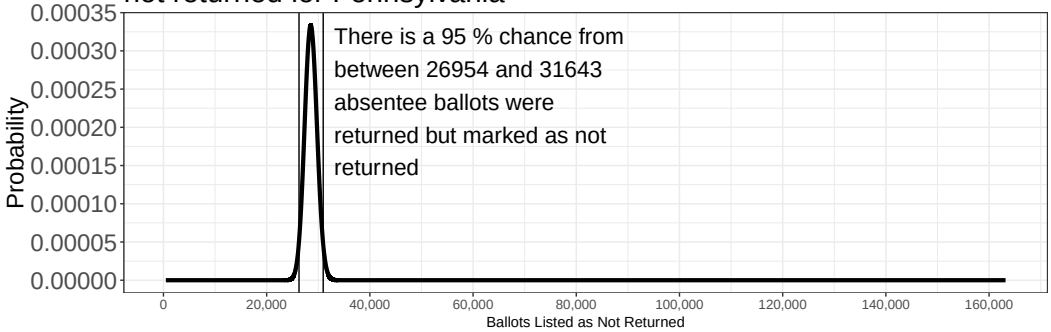
Probability of numbers of absentee ballots returned but listed as not returned for Michigan



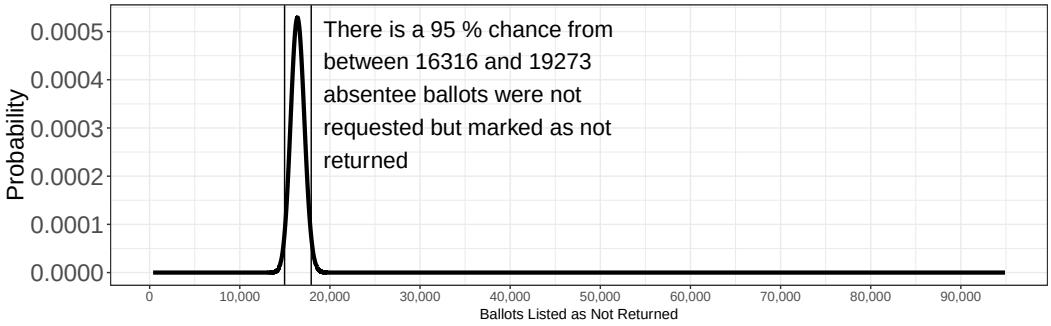
Probability of numbers of un−requested absentee ballots listed as not returned for Pennsylvania



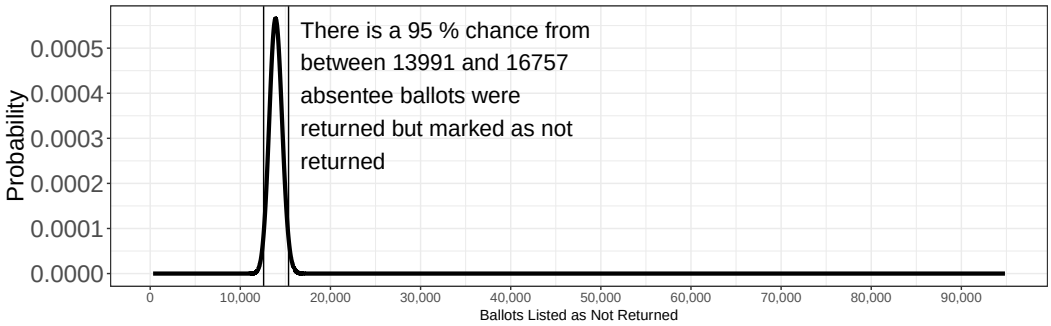
Probability of numbers of absentee ballots returned but listed as not returned for Pennsylvania



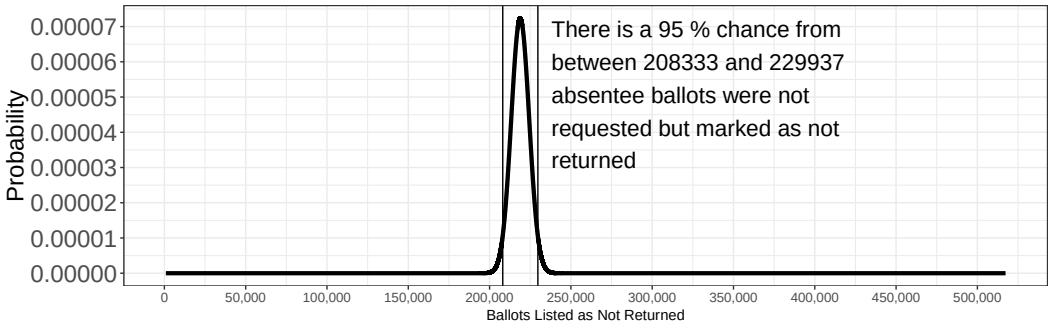
Probability of numbers of un−requested absentee ballots listed as not returned for Wisconsin



Probability of numbers of absentee ballots returned but listed as not returned for Wisconsin



Probability of numbers of un−requested absentee ballots listed as not returned for Arizona



Probability of numbers of absentee ballots returned but listed as not returned for Arizona

An Analysis of Surveys Regarding Absentee Ballots In Wisconsin

William M. Briggs

November 23, 2020

1 Summary

Survey data was collected from individuals in Wisconsin, sampling those listed as not returning absentee ballots. The data was provided by Matt Braynard.

The survey asked respondents whether they (a) had ever requested an absentee ballot, and, if so, (b) whether they had in fact returned this ballot. From this sample I produce predictions of the total numbers of: **Error #1**, those who were recorded as receiving absentee ballots *without* requesting them; and **Error #2**, those who returned absentee ballots but whose votes went missing (i.e. marked as unreturned).

The sizes of both errors were large.

2 Analysis Description

The analysis used (a) the number of absentee ballots recorded as unreturned, (b) the total responding to the survey, (c) the total of those saying they did not request a ballot, (d) the total of those saying they did request a ballot, and of these (e) the number saying they returned their ballots. I assume survery respondents are representative and the data is accurate.

From these data a simple parameter-free predictive model was used to calculate the probability of all possible outcomes. Pictures of these probabilities were derived, and the 95% prediction interval of the relevant numbers was calculated. The pictures appear in the Appendix at the end. They are summarized here with their 95% prediction intervals.

Error #1: being recorded as sent an absentee ballot without requesting one.

Error #2: sending back an absentee ballot and having it recorded as not returned.

State	Unreturned ballots	Error #1	Error #2
Wisconsin	96,771	16,316–19,273	13,991–16,757

Ballots that were not requested, and ballots returned and marked as not returned were classed as *troublesome*. The estimated average number of troublesome ballots were then calculated using the table above and are presented next.

State	Unreturned ballots	Estimated average troublesome ballots	Percent
Wisconsin	96,771	29,594	31%

3 Conclusion

There are clearly a large number of troublesome ballots in Wisconsin. Ballots marked as not returned that were never requested are clearly an error of some kind. The error is not small as a percent of the total recorded unreturned ballots.

Ballots sent back and unrecorded is a separate error. These represent votes that have gone missing, a serious mistake. The number of these missing ballots is also large.

Survey respondents were not asked if they received an unrequested ballot whether they sent these ballots back. This is clearly a lively possibility, and represents a third possible source of error, including the potential of voting twice (once by absentee and once at the polls). No estimates or likelihood can be calculated for this potential error due to absence of data.

4 Declaration of William M. Briggs, PhD

1. My name is William M. Briggs. I am over 18 years of age and am competent to testify in this action. All of the facts stated herein are true and based on my personal knowledge.
2. I received a Ph.D of Statistics from Cornell University in 2004.
3. I am currently a statistical consultant. I make this declaration in my personal capacity.
4. I have analyzed data regarding responses to questions relating to mail ballot requests, returns and related issues.

5. I attest to a reasonable degree of professional certainty that the resulting analysis are accurate.

I declare under the penalty of perjury that the foregoing is true and correct.

23 November 2020

William M. Briggs

5 Appendix

The probability pictures for Wisconsin for each outcome as mentioned above.

William M. Briggs, PhD
Statistician to the Stars!
matt@wmbriggs.com
917-392-0691

1. Experience

(1) 2016: Author of *Uncertainty: The Soul of Modeling, Probability & Statistics*, a book which argues for a complete and fundamental change in the philosophy and practice of probability and statistics. Eliminate hypothesis testing and estimation, and move to verifiable predictions. This includes AI and machine learning. Call this The Great Reset, but a good one.

(2) 2004-2016 Adjunct Professor of Statistical Science, Cornell University, Ithaca, New York
I taught a yearly Masters course to people who (rightfully) hate statistics. Interests: philosophy of science & probability, epistemology, epidemiology (ask me about the all-too-common epidemiologist fallacy), Bayesian statistics, medicine, climatology & meteorology, goodness of forecasts, overconfidence in science; public understanding of science, limitations of science, scientism; scholastic metaphysics (as it relates to epistemology).

(3) 1998-present. Statistical consultant, Various companies
Most of my time is spent coaxing people out of their money to tell them they are too sure of themselves. All manner of analyses cheerfully undertaken. Example: Fraud analysis; I created the *Wall Street Journal's* College Rankings. I consultant regularly at Methodist and other hospitals, start-ups, start-downs, and with any instition willing to fork it over.

(4) 2003-2010. Research Scientist, New York Methodist Hospital, New York
Besides the usual, I sit/sat on the Institutional Review Committee to assess the statistics of proposed research. I was an Associate Editor for *Monthly Weather Review* (through 2011). Also a member of the American Meteorological Society's Probability and Statistics Committee (through 2011). At a hospital? Yes, sir; at a hospital. It rains there, too, you know.

(5) Fall 2007, Fall 2010 Visiting Professor of Statistics, Department of Mathematics, Central Michigan University, Mt. Pleasant, MI
Who doesn't love a visit from a statistician? Ask me about the difference between "a degree" and "an education."

(6) 2003-2007, Assistant Professor Statistics, Weill Medical College of Cornell University, New York, New York
Working here gave me a sincere appreciation of the influences of government money; grants galore.

(7) 2002-2003. Gotham Risk Management, New York
A start-up then, after Enron's shenanigans, a start-down. We set future weather derivative and weather insurance contract prices that incorporated information from medium- and long-range weather and climate forecasts.

(8) 1998-2002. DoubleClick, New York
Lead statistician. Lot of computer this and thats; enormous datasets.

(9) 1993-1998. Graduate student, Cornell University

Meteorology, applied climatology, and finally statistics. Was Vice Chair of the graduate student government; probably elected thanks to a miracle.

(10) 1992-1993. National Weather Service, Sault Ste. Marie, MI
Forecast storms o' the day and launched enormous balloons in the name of Science. My proudest moment came when I was able to convince an ancient IBM-AT machine to talk to an *analog*, 110 baud, phone-coupled modem, all using BASIC!

(11) 1989-1992. Undergraduate student, Central Michigan University
Meteorology and mathematics. Started the local student meteorology group to chase tornadoes. Who knew Michigan had so few? Spent a summer at U Michigan playing with a (science-fiction-sounding) lidar.

(12) 1983-1989. United States Air Force
Cryptography and other secret stuff. Shot things; learned pinochle. I adopted and became proficient with a fascinating and versatile vocabulary. Irritate me for examples. TS/SCI, etc. security clearance (now inactive).

2. Education

(1) Ph.D., 2004, Cornell University. Statistics.
(2) M.S., 1995, Cornell University. Atmospheric Science.
(3) B.S., Summa Cum Laude, 1992, Central Michigan University. Meteorology and Math.

3. Publications

3.0.1. *Popular.*

(1) Op-eds in various newspapers; articles in *Stream*, *Crisis Magazine*, *The Remnant*, *Quadrant*, *Quirks*; blog with ∼70,000 monthly readers. Various briefs submitted to government agencies, such as California Air Resources Board, Illinois Department of Natural Resources. Talks and holding-forths of all kinds.

3.0.2. *Books.*

(1) Richards, JW, WM Briggs, and D Axe, 2020. *UThe Price of Panic: How the Tyranny of Experts Turned a Pandemic into a Catastrophe*. Regnery. Professors Jay Richards, William Briggs, and Douglas Axe take a deep dive into the crucial questions on the minds of millions of Americans during one of the most jarring and unprecedented global events in a generation.

(2) Briggs, WM., 2016. *Uncertainty: The Soul of Modeling, Probability & Statistics*. Springer. Philosophy of probability and statistics. A new (old) way to view and to use statistics, a way that doesn't lead to heartbreak and pandemic over-certainty, like current methods do.

(3) Briggs, WM., 2008 *Breaking the Law of Averages: Real Life Probability and Statistics in Plain English*. Lulu Press, New York. Free text for undergraduates.

Before this Court

EXPERT REPORT OF MATTHEW BRAYNARD

I. INTRODUCTION

I have been retained as an expert witness on behalf of Petitioners in the above captioned proceeding. I expect to testify on the following subject matters: (i) analysis of the database for the November 3, 2020 election for the selection of Presidential Electors in the State of Wisconsin ("State"); (ii) render opinions regarding whether individuals identified in the State's voter database actually voted; and (iii) render opinions regarding whether individuals identified in the State's voter database were actually qualified to vote on election day.

This is a statement of my relevant opinions and an outline of the factual basis for these opinions. The opinions and facts contained herein are based on the information made available to me in this case prior to preparation of this report, as well as my professional experience as an election data analyst.

I reserve the right to supplement or amend this statement on the basis of further information obtained prior to the time of trial or in order to clarify or correct the information contained herein.

II. DOCUMENTS REVIEWED

I reviewed the following documents in arriving at my opinions.

1. The voter records and election returns as maintained on the State's election database;

2. Records maintained by the National Change of Address Source which is maintained by the United States Postal Service and which is available for licensed users on the internet. I am a licensed member.

3. Records developed by the staff of my call centers and social media researchers; and

4. A national voter database maintained by L2 Political;

In addition, I discussed the facts of this matter with Petitioner's attorney Erick G. Kaardal and members of his legal team.

III. PROFESSIONAL QUALIFICATIONS

I have attached hereto as Exhibit 1 a true and correct copy of my resume. As detailed in the resume, I graduated from George Washington University in 2000 with a degree in business administration with a concentration in finance and management information systems. I have been working in the voter data and election administration field since 1996. I have worked building and deploying voter databases for the Republican National Committee, five Presidential campaigns, and no less than one-hundred different campaigns and election-related organizations in all fifty states and the U.S. Virgin Islands. I worked for eight years as a senior analyst at the nation's premier redistricting and election administration firm, Election Data Services, where I worked with states and municipalities on voter databases, delineation, and litigation support related to these matters. Also, while at Election Data Services, I worked under our contract with the US Census Bureau analyzing voting age population. Since 2004, I have worked for my own business, now known as External Affairs, Inc., providing

statistical and data analysis for local, state, and federal candidates and policy organizations in the areas of voter targeting, polling/research, fundraising, branding, and online development and strategy. My firm has worked for over two-hundred candidates from president to town council and over a dozen DC-based policy/advocacy organizations.

With respect to publications I have authored in the last 10 years, I have not authored any publications in the last ten years.

IV. COMPENSATION

I have been retained as an expert witness for Petitioners. I am being compensated for a flat fee of $40,000.

V. PRIOR TESTIMONY

I have not provided testimony as an expert either at trial or in deposition in the last four years.

VI. STATEMENT OF OPINIONS

As set forth above, I have been engaged to provide expert opinions regarding analysis in the November 3, 2020 election of Presidential electors. Based on my review of the documents set forth above, my discussions with statisticians and analysts working with me and at my direction, my discussions with the attorneys representing the Petitioners, I have the following opinions:

1. It is my opinion, to a reasonable degree of scientific certainty, that in the State, the State's database for the November 3, 2020 election show 96,711 voters whom the state marks as having requested and been sent an absentee ballot did not return it. It is my opinion, to a reasonable degree of scientific certainty, that in my sample

of this universe, 18.12% of these absentee voters in the State did not request an absentee ballot.

2. From the State's database for the November 3, 2020 election and our call center results, it is my opinion to a reasonable degree of scientific certainty that 96,771 individuals whom the State's database identifies as having not returned an absentee ballot, that in my sample of this universe, 15.37% of those absentee voters did in fact mail back an absentee ballot to the clerk's office.

3. From the State's database for the November 3, 2020 election, the NCOA database, and our call center results, it is my opinion to a reasonable degree of scientific certainty that out of the 26,673 individuals had changed their address before the election, that in my sample of this universe, 1.11% of those individuals denied casting a ballot.

4. From the State's database for the November 3, 2020 election and the NCOA database and other state's voter databases, it is my opinion to a reasonable degree of scientific certainty, that at least 6,848 absentee or early voters were not residents of the State when they voted.

5. From the State's database for the November 3, 2020 election and my staff's review of social media for voters who applied for indefinitely confined absentee voting status, it is my opinion to a reasonable degree of scientific certainty, that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

6. From the State's database for the November 3, 2020 election and comparing that data to other states voting data and identifying individuals who cast early/absentee ballots in multiple states, it is my opinion to a reasonable degree of scientific certainty, that at least 234 individuals in the State voted in multiple states.

VII. BASIS AND REASONS SUPPORTING OPINIONS.

First, State maintains a database for the November 3, 2020 election which I obtained from L2 Political and which L2 Political obtained from the State's records on, among other things, voters who applied for an absentee or early voter status. I received this database from L2 Political in a table format with columns and rows which can be searched, sorted and filtered. Each row sets forth data on an individual voter. Each

column contained information such as the name of the voter, the voter's address, whether the voter applied for an absentee ballot, whether the voter voted and whether the voter voted indefinitely confined status.

Second, we are able to obtain other data from other sources such as the National Change of Address Database maintained by the United States Postal Service and licensed by L2 Political. This database also in table format shows the name of an individual, the individual's new address, the individual's old address and the date that the change of address became effective.

Third, I conducted randomized surveys of data obtained from the State's database by having my staff or the call center's staff make phone calls to and ask questions of individuals identified on the State's database by certain categories such as absentee voters who did not return a ballot. Our staff, if they talked to any of these individuals, would then ask a series of questions beginning with a confirmation of the individual's name to ensure it matched the name of the voter identified in the State's database. The staff would then ask additional questions of the individuals and record the answers.

Fourth, I had this staff survey a random sample I obtained from the State's database on indefinitely confined voters. The staff conducted research on the internet and social media postings by these individuals. Staff would undertake to determine if the individual was the individual listed on the database meant the State's definition of indefinitely confined. Staff would then attempt to determine if the individuals had posted photos, images or other information demonstrating that the individuals were not indefinitely confined. For instance, if the individual's social media showed a photo on or

near election day of the individual doing something inconsistent with indefinitely confined status such as riding a bike. Staff would then record the results as either "not indefinitely confined," "confirmed indefinitely confined," or "inconclusive."

Fifth, attached as Exhibits 2 is my written analysis of the data obtained.

Below are the opinions I rendered and the basis of the reasons for those opinions.

1. It is my opinion, to a reasonable degree of scientific certainty, that in the State, the State's database for the November 3, 2020 election show 96,711 voters whom the state marks as having requested and been sent an absentee ballot did not return it. It is my opinion, to a reasonable degree of scientific certainty, that in my sample of this universe, 18.12% of these absentee voters in the State did not request an absentee ballot.

I obtained this data from the State via L2 Political after the November 3, 2020, Election Day. This data identified 96,771 absentee voters who were sent an absentee ballot but who failed to return the absentee ballot.

I then had my staff make phone calls to a sample of this universe. When contacted, I had my staff confirm the individual's identity by name. Once the name was confirmed, I then had staff ask if the person requested an absentee ballot or not. Staff then recorded the number of persons who answered yes. My staff then recorded that of the 2,114 individuals who answered the question, 1,731 individuals answered yes to the question whether they requested an absentee ballot. My staff recorded that 383 individuals answered no to the question whether they requested an absentee ballot. Attached as Exhibit 2 is my written analysis containing information from the data above on absentee voters. Paragraph 2 of Exhibit 2 presents this information.

Next, I then had staff ask the individuals who answered yes, they requested an absentee ballot, whether the individual mailed back the absentee ballot or did not mail back the absentee ballot. Staff then recorded that of the 1,626 individuals who answered the question, 325 individuals answered yes, they mailed back the absentee ballot. Staff recorded 1301 individuals answered no, they did not mail back the absentee ballot. Paragraph 2 of Exhibit 2 presents this information.

Based on these results, 18.12% of our sample of these absentee voters in the State did not request an absentee ballot.

2. From the State's database for the November 3, 2020 election and our call center results, it is my opinion to a reasonable degree of scientific certainty that 96,771 individuals whom the State's database identifies as having not returned an absentee ballot, that in my sample of this universe, 15.37% of those absentee voters did in fact mail back an absentee ballot to the clerk's office.

This opinion includes the analysis set forth above. Among the 1,626 who told our call center that they did request an absentee ballot and answered the second question, 325 told our staff that they mailed the absentee ballot back, which is 15.37% of those whom the State identified as having not returned the absentee ballot the State sent them. Paragraph 2 of Exhibit 2 presents this information.

3. From the State's database for the November 3, 2020 election, the NCOA database, and our call center results, it is my opinion to a reasonable degree of scientific certainty that out of the 26,673 individuals had changed their address before the election, that in my sample of this universe, 1.11% of those individuals denied casting a ballot.

On Exhibit 2, in paragraph 4, I took the State's database of all absentee or early voters and matched those voters to the NCOA database for the day after election day.

This data identified 26,673 individuals whose address on the State's database did not match the address on the NCOA database on election day. Next, I had my staff call the persons identified and ask these individuals whether they had voted. My call center staff identified 1,607 individuals who confirmed that they had casted a ballot. My call center staff identified 18 individuals who denied casting a ballot. Our analysis shows that 1.11% of our sample of these individuals who changed address did not vote despite the State's data recorded that the individuals did vote.

4. From the State's database for the November 3, 2020 election and the NCOA data and other state's voter data, it is my opinion to a reasonable degree of scientific certainty, that at least 6,848 absentee or early voters were not residents of the State when they voted.

On Exhibit 2, in paragraph 1, I took the State's database of all absentee or early voters and matched those voters to the NCOA database for the day after Election Day. This data identified 6,207 individuals who had moved of the State prior to Election Day. Further, by comparing the other 49 states voter databases to the State's database, I identified 765 who registered to vote in a state other than the State subsequent to the date they registered to vote in the State. When merging these two lists and removing the duplicates, and accounting for moves that would not cause an individual to lose their residency and eligibility to vote under State law, these voters total 6,848.

5. From the State's database for the November 3, 2020 election and my staff's review of social media for voters who applied for indefinitely confined absentee voting status, it is my opinion to a reasonable degree of scientific certainty, that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

This opinion is taken from data developed on Exhibit 3. For this determination, I had my staff investigate using the internet and social media the individuals the State's data identified as claiming indefinitely confined status in their absentee ballot applications. The staff conducted research on the internet and social media postings by these individuals. Staff would undertake to determine if the individual was the individual listed on the database as indefinitely confined. Staff would then attempt to determine if the individuals had posted photos, images or other information demonstrating that the individuals were not indefinitely confined. For instance, if the individual's social media showed a photo on or near election day doing something inconsistent with indefinitely confined status such as riding a bike. Staff would then record the results as either "not indefinitely confined," "confirmed indefinitely confined," or "inconclusive."

These results showed that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

6. From the State's database for the November 3, 2020 election and comparing that data to other states voting data and identifying individuals who cast early/absentee ballots in multiple states, it is my opinion to a reasonable degree of scientific certainty, that at least 234 individuals in the State voted in multiple states.

On Exhibit 2, in paragraph 2, I had my staff compare the State's early and absentee voters to other states voting data and identified individuals who cast early/absentee ballots in multiple states. My staff located 234 individuals who voted in the State and in other states for the November 3, 2020 general election.

VIII. EXHIBITS TO BE USED AT TRIAL TO SUMMARIZE OR EXPLAIN OPINIONS

At the present time, I intend to rely on the documents produced set forth above as possible exhibits.

EXPERT REPORT OF MATTHEW BRAYNARD

I. INTRODUCTION

I have been retained as an expert witness on behalf of Petitioners in the above captioned proceeding. I expect to testify on the following subject matters: (i) analysis of the database for the November 3, 2020 election for the selection of Presidential Electors in the State of Wisconsin ("State"); (ii) render opinions regarding whether individuals identified in the State's voter database actually voted; and (iii) render opinions regarding whether individuals identified in the State's voter database were actually qualified to vote on election day.

This is a statement of my relevant opinions and an outline of the factual basis for these opinions. The opinions and facts contained herein are based on the information made available to me in this case prior to preparation of this report, as well as my professional experience as an election data analyst.

I reserve the right to supplement or amend this statement on the basis of further information obtained prior to the time of trial or in order to clarify or correct the information contained herein.

II. DOCUMENTS REVIEWED

I reviewed the following documents in arriving at my opinions.

1. The voter records and election returns as maintained on the State's election database;

2. Records maintained by the National Change of Address Source which is maintained by the United States Postal Service and which is available for licensed users on the internet. I am a licensed member.

3. Records developed by the staff of my call centers and social media researchers; and

4. A national voter database maintained by L2 Political;

In addition, I discussed the facts of this matter with Petitioner's attorney Erick G. Kaardal and members of his legal team.

III. PROFESSIONAL QUALIFICATIONS

I have attached hereto as Exhibit 1 a true and correct copy of my resume. As detailed in the resume, I graduated from George Washington University in 2000 with a degree in business administration with a concentration in finance and management information systems. I have been working in the voter data and election administration field since 1996. I have worked building and deploying voter databases for the Republican National Committee, five Presidential campaigns, and no less than one-hundred different campaigns and election-related organizations in all fifty states and the U.S. Virgin Islands. I worked for eight years as a senior analyst at the nation's premier redistricting and election administration firm, Election Data Services, where I worked with states and municipalities on voter databases, delineation, and litigation support related to these matters. Also, while at Election Data Services, I worked under our contract with the US Census Bureau analyzing voting age population. Since 2004, I have worked for my own business, now known as External Affairs, Inc., providing

statistical and data analysis for local, state, and federal candidates and policy organizations in the areas of voter targeting, polling/research, fundraising, branding, and online development and strategy. My firm has worked for over two-hundred candidates from president to town council and over a dozen DC-based policy/advocacy organizations.

With respect to publications I have authored in the last 10 years, I have not authored any publications in the last ten years.

IV. COMPENSATION

I have been retained as an expert witness for Petitioners. I am being compensated for a flat fee of $40,000.

V. PRIOR TESTIMONY

I have not provided testimony as an expert either at trial or in deposition in the last four years.

VI. STATEMENT OF OPINIONS

As set forth above, I have been engaged to provide expert opinions regarding analysis in the November 3, 2020 election of Presidential electors. Based on my review of the documents set forth above, my discussions with statisticians and analysts working with me and at my direction, my discussions with the attorneys representing the Petitioners, I have the following opinions:

1. It is my opinion, to a reasonable degree of scientific certainty, that in the State, the State's database for the November 3, 2020 election show 96,711 voters whom the state marks as having requested and been sent an absentee ballot did not return it. It is my opinion, to a reasonable degree of scientific certainty, that in my sample

of this universe, 18.12% of these absentee voters in the State did not request an absentee ballot.

2. From the State's database for the November 3, 2020 election and our call center results, it is my opinion to a reasonable degree of scientific certainty that 96,771 individuals whom the State's database identifies as having not returned an absentee ballot, that in my sample of this universe, 15.37% of those absentee voters did in fact mail back an absentee ballot to the clerk's office.

3. From the State's database for the November 3, 2020 election, the NCOA database, and our call center results, it is my opinion to a reasonable degree of scientific certainty that out of the 26,673 individuals had changed their address before the election, that in my sample of this universe, 1.11% of those individuals denied casting a ballot.

4. From the State's database for the November 3, 2020 election and the NCOA database and other state's voter databases, it is my opinion to a reasonable degree of scientific certainty, that at least 6,848 absentee or early voters were not residents of the State when they voted.

5. From the State's database for the November 3, 2020 election and my staff's review of social media for voters who applied for indefinitely confined absentee voting status, it is my opinion to a reasonable degree of scientific certainty, that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

6. From the State's database for the November 3, 2020 election and comparing that data to other states voting data and identifying individuals who cast early/absentee ballots in multiple states, it is my opinion to a reasonable degree of scientific certainty, that at least 234 individuals in the State voted in multiple states.

VII. BASIS AND REASONS SUPPORTING OPINIONS.

First, State maintains a database for the November 3, 2020 election which I obtained from L2 Political and which L2 Political obtained from the State's records on, among other things, voters who applied for an absentee or early voter status. I received this database from L2 Political in a table format with columns and rows which can be searched, sorted and filtered. Each row sets forth data on an individual voter. Each

column contained information such as the name of the voter, the voter's address, whether the voter applied for an absentee ballot, whether the voter voted and whether the voter voted indefinitely confined status.

Second, we are able to obtain other data from other sources such as the National Change of Address Database maintained by the United States Postal Service and licensed by L2 Political. This database also in table format shows the name of an individual, the individual's new address, the individual's old address and the date that the change of address became effective.

Third, I conducted randomized surveys of data obtained from the State's database by having my staff or the call center's staff make phone calls to and ask questions of individuals identified on the State's database by certain categories such as absentee voters who did not return a ballot. Our staff, if they talked to any of these individuals, would then ask a series of questions beginning with a confirmation of the individual's name to ensure it matched the name of the voter identified in the State's database. The staff would then ask additional questions of the individuals and record the answers.

Fourth, I had this staff survey a random sample I obtained from the State's database on indefinitely confined voters. The staff conducted research on the internet and social media postings by these individuals. Staff would undertake to determine if the individual was the individual listed on the database meant the State's definition of indefinitely confined. Staff would then attempt to determine if the individuals had posted photos, images or other information demonstrating that the individuals were not indefinitely confined. For instance, if the individual's social media showed a photo on or

near election day of the individual doing something inconsistent with indefinitely confined status such as riding a bike. Staff would then record the results as either "not indefinitely confined," "confirmed indefinitely confined," or "inconclusive."

Fifth, attached as Exhibits 2 is my written analysis of the data obtained.

Below are the opinions I rendered and the basis of the reasons for those opinions.

1. It is my opinion, to a reasonable degree of scientific certainty, that in the State, the State's database for the November 3, 2020 election show 96,711 voters whom the state marks as having requested and been sent an absentee ballot did not return it. It is my opinion, to a reasonable degree of scientific certainty, that in my sample of this universe, 18.12% of these absentee voters in the State did not request an absentee ballot.

I obtained this data from the State via L2 Political after the November 3, 2020, Election Day. This data identified 96,771 absentee voters who were sent an absentee ballot but who failed to return the absentee ballot.

I then had my staff make phone calls to a sample of this universe. When contacted, I had my staff confirm the individual's identity by name. Once the name was confirmed, I then had staff ask if the person requested an absentee ballot or not. Staff then recorded the number of persons who answered yes. My staff then recorded that of the 2,114 individuals who answered the question, 1,731 individuals answered yes to the question whether they requested an absentee ballot. My staff recorded that 383 individuals answered no to the question whether they requested an absentee ballot. Attached as Exhibit 2 is my written analysis containing information from the data above on absentee voters. Paragraph 2 of Exhibit 2 presents this information.

Next, I then had staff ask the individuals who answered yes, they requested an absentee ballot, whether the individual mailed back the absentee ballot or did not mail back the absentee ballot. Staff then recorded that of the 1,626 individuals who answered the question, 325 individuals answered yes, they mailed back the absentee ballot. Staff recorded 1301 individuals answered no, they did not mail back the absentee ballot. Paragraph 2 of Exhibit 2 presents this information.

Based on these results, 18.12% of our sample of these absentee voters in the State did not request an absentee ballot.

2. From the State's database for the November 3, 2020 election and our call center results, it is my opinion to a reasonable degree of scientific certainty that 96,771 individuals whom the State's database identifies as having not returned an absentee ballot, that in my sample of this universe, 15.37% of those absentee voters did in fact mail back an absentee ballot to the clerk's office.

This opinion includes the analysis set forth above. Among the 1,626 who told our call center that they did request an absentee ballot and answered the second question, 325 told our staff that they mailed the absentee ballot back, which is 15.37% of those whom the State identified as having not returned the absentee ballot the State sent them. Paragraph 2 of Exhibit 2 presents this information.

3. From the State's database for the November 3, 2020 election, the NCOA database, and our call center results, it is my opinion to a reasonable degree of scientific certainty that out of the 26,673 individuals had changed their address before the election, that in my sample of this universe, 1.11% of those individuals denied casting a ballot.

On Exhibit 2, in paragraph 4, I took the State's database of all absentee or early voters and matched those voters to the NCOA database for the day after election day.

This data identified 26,673 individuals whose address on the State's database did not match the address on the NCOA database on election day. Next, I had my staff call the persons identified and ask these individuals whether they had voted. My call center staff identified 1,607 individuals who confirmed that they had casted a ballot. My call center staff identified 18 individuals who denied casting a ballot. Our analysis shows that 1.11% of our sample of these individuals who changed address did not vote despite the State's data recorded that the individuals did vote.

4. From the State's database for the November 3, 2020 election and the NCOA data and other state's voter data, it is my opinion to a reasonable degree of scientific certainty, that at least 6,848 absentee or early voters were not residents of the State when they voted.

On Exhibit 2, in paragraph 1, I took the State's database of all absentee or early voters and matched those voters to the NCOA database for the day after Election Day. This data identified 6,207 individuals who had moved of the State prior to Election Day. Further, by comparing the other 49 states voter databases to the State's database, I identified 765 who registered to vote in a state other than the State subsequent to the date they registered to vote in the State. When merging these two lists and removing the duplicates, and accounting for moves that would not cause an individual to lose their residency and eligibility to vote under State law, these voters total 6,848.

5. From the State's database for the November 3, 2020 election and my staff's review of social media for voters who applied for indefinitely confined absentee voting status, it is my opinion to a reasonable degree of scientific certainty, that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

This opinion is taken from data developed on Exhibit 3. For this determination, I had my staff investigate using the internet and social media the individuals the State's data identified as claiming indefinitely confined status in their absentee ballot applications. The staff conducted research on the internet and social media postings by these individuals. Staff would undertake to determine if the individual was the individual listed on the database as indefinitely confined. Staff would then attempt to determine if the individuals had posted photos, images or other information demonstrating that the individuals were not indefinitely confined. For instance, if the individual's social media showed a photo on or near election day doing something inconsistent with indefinitely confined status such as riding a bike. Staff would then record the results as either "not indefinitely confined," "confirmed indefinitely confined," or "inconclusive."

These results showed that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

6. From the State's database for the November 3, 2020 election and comparing that data to other states voting data and identifying individuals who cast early/absentee ballots in multiple states, it is my opinion to a reasonable degree of scientific certainty, that at least 234 individuals in the State voted in multiple states.

On Exhibit 2, in paragraph 2, I had my staff compare the State's early and absentee voters to other states voting data and identified individuals who cast early/absentee ballots in multiple states. My staff located 234 individuals who voted in the State and in other states for the November 3, 2020 general election.

VIII. EXHIBITS TO BE USED AT TRIAL TO SUMMARIZE OR EXPLAIN OPINIONS

At the present time, I intend to rely on the documents produced set forth above as possible exhibits.

Matthew Braynard

[redacted]

Pursuant to 28 U.S.C Section 1746, I, [redacted], make the following declaration.

1. I am over the age of 21 years and am a resident of Monroe County, Florida.
2. I am under no legal disability that would prevent me from giving this declaration.
3. I hold a Bachelor of Science degree in Mathematics and a Master of Science degree in Statistics.
4. For thirty years, I have conducted statistical data analysis for companies in various industries, including aerospace, consumer packaged goods, disease detection and tracking, and fraud detection.
5. From November 13th, 2020 through November 28th, 2020, I conducted in-depth statistical analysis of publicly available data on the 2020 U.S. Presidential Election. This data included vote counts for each county in the United States, U.S. Census data, and type of voting machine data provided by the U.S. Election Assistance Committee.
6. The analysis yielded several "red flags" concerning the percentage of votes won by candidate Biden in counties using voting machines provided by Dominion Voting Systems. These red flags occurred in several States in the country, including Wisconsin.
7. I began by using Chi-Squared Automatic Interaction Detection (CHAID), which treats the data in an agnostic way—that is, it imposes no parametric assumptions that could otherwise introduce bias. Here, I posed the following question: "Do any voting machine

types appear to have unusual results?" The answer provided by the statistical technique/algorithm was that machines from Dominion Voting Systems (Dominion) produced abnormal results.

8. Subsequent graphical and statistical analysis shows the unusual pattern involving machines from Dominion occurs in at least 100 counties and multiple States, including Wisconsin.

9. The results from most, if not all counties using the Dominion machines is three to five point six percentage points higher in favor of candidate Biden than the results should be. This pattern is seen easily in graphical form when the results from "Dominion" counties are overlaid against results from "non-Dominion" counties. The results from "Dominion" counties do not match the results from the rest of the counties in the United States. The results are certainly statistically significant, with a p-value of < 0.00004. This translates into a statistical impossibility that something unusual involving Dominion machines is *not* occurring. This pattern appears in multiple States, including Wisconsin, and the margin of votes implied by the unusual activity would easily sway the election results.

10. The following graph shows the pattern. The large red dots are counties in Wisconsin that use Dominion voting machines. Almost all of them are above the blue prediction line, when in normal situations approximately half of them would be below the prediction line (as evidence by approximately half the counties in the U.S. (blue dots) that are below the blue centerline). The p-value of statistical analysis regarding the centerline for the red dots (Wisconsin counties

with Dominion machines) is 0.000000049, pointing to a statistical impossibility that this is a "random" statistical anomaly. Some external force caused this anomaly

11. To confirm that Dominion machines were the source of the pattern/anomaly, I conducted further analysis using propensity scoring using U.S. census variables (Including ethnicities, income, professions, population density and other social/economic data) , which was used to place counties into paired groups. Such an analysis is important because one concern could be that counties with Dominion systems are systematically different from their counterparts, so abnormalities in the margin for Biden are driven by other characteristics unrelated to the election.

12. After matching counties using propensity score analysis, the only difference between the groups was the presence of Dominion machines. This approach again showed a highly statistically significant difference between the two groups, with candidate Biden again averaging three percentage points higher in Dominion counties than in the associated paired county. The associated p-value is < 0.00005, against indicating a statistical impossibility that something unusual is not occurring involving Dominion machines.

13. The results of the analysis and the pattern seen in the included graph strongly suggest a systemic, system-wide algorithm was enacted by an outside agent, causing the results of Wisconsin's vote tallies to be inflated by somewhere between three and five point six percentage points. Statistical estimating yields that in Wisconsin, the best estimate of the number of impacted votes is 181,440. However, a 95% confidence interval calculation yields that as many as 236,520 votes may have been impacted.

I declare under penalty of perjury that the forgoing is true and correct. Executed this November 28th, 2020.

[redacted],

STATE OF COLORADO)
)ss.
County of Douglas)

COMES NOW, Affiant Joseph T. Oltmann, being first duly sworn, under oath, and states under penalty of perjury that the following information is true and accurate within his personal knowledge and belief:

My name Joseph Oltmann. I am over eighteen years of age. I am not suffering under any mental disability and am competent to give this worn affidavit. I am able to read and write and to give this affidavit voluntarily and on my own free will and accord. No one has used any threats, force, pressure, or intimidation to male me sign this affidavit. I make this affidavit in support of the truth.

I am the CEO of a tech company based just outside of Denver, Colorado. I am also the founder of an organization called FEC United. [Fecunited.com] The goal of this organization is to restore constitutional integrity to our community and empower those in our community to stand up to state and national leadership that intends to suppress the rights of individuals holistically.

Through this organization "FEC" I became a target of journalists who began to slander both me and my organization. I became the topic of Antifa and extremists through my involvement in a movement to resist the narrative that police are bad and our society represented the rhetoric shared by these extremists. As a result of these attacks, I started researching Antifa, BLM, Inc. and their connection to violence and unrest inside of our communities. As a result, I set out to infiltrate Antifa meetings and de-mask those Antifa members who are journalists in the mainstream media in Colorado specifically.

On or about the week of September 27, 2020, I was able to attend an Antifa meeting which appeared to be between Antifa members in Colorado Springs and in Denver Colorado. I cannot verify the connection between the two or the leadership as they were disorganized. Discussions of Our Revolution and Antifa were discussed. Rhetoric of "eliminating fascists" and frustration as to the dwindling of support to rally in the street was evident.

Then I honed in among other conversations key actors in the organization who work for local and state news publications. One such person of interest was Heidi Beedle, identified leader of Our Revolution in El Paso County (Southern Colorado) and Antifa leader of the same area.

Heidi's name is actually Sean Beedle. She is a journalist at Colorado Springs Independent, Colorado Springs Business Journal and a freelance writer for several online publications. Others to remain unnamed in this were present.

The conversation went like this:

Someone identified as "Eric" began to speak. Someone asked who Eric was, and someone else replied "he is the Dominion guy" [paraphrased].

Eric then began to speak after being told to continue, but was interrupted and asked by someone, "What are we going to do if Trump wins this fucking election?"

Eric responded, "Don't worry about the election. Trump is not going to win. I made fucking sure of that.. Hahaha"

Someone responded, "Fucking right."

Eric continued with fortifying the groups and recruiting. I would describe his tone as eccentric and boisterous. I wrote down his name and started to do some research into him.

At the time, I thought that they were so disconnected with reality that they think they can "make sure Trump is not elected."

I started with a simple google search: Keywords: "Eric," "Dominion," "Denver Colorado." The fifth result in organic search returned:

Dominion Voting Systems | Employee Profiles, Emails, Mutual ...

www.leadcandy.io › company › Dominion-Voting-Syst...

Find people working at Dominion Voting Systems. LeadCandy provides Full ... Denver, Colorado. VIEW FULL PROFILE ... FULL PROFILE. Eric Coomer's photo ...

Above that were results for Eric Schussler- Old Dominion University and Eric E Johnson, Attorney - Sherman & Howard. The first two on organic search however was as follows:

Dominion - Colorado Secretary of State

rocketreach.co › eric-coomer-email_7112825

Location, **Denver, Colorado**, United States. Work, Director, Market Strategy @ **Dominion** Voting Systems Member, Board of Directors @ Friends of Levitt Pavilion ...

I began doing research on Eric Coomer and discovered that Colorado Secretary of state link the following about Dr. Eric Coomer on page 26:

"Eric Coomer graduated from the University of California, Berkeley in 1997 with a Ph.D. in Nuclear Physics. After working in IT consulting for several years, Eric entered the elections industry in 2005 with Sequoia Voting Systems as Chief Software Architect. After three years with the company, Eric took over all development operations as Vice President of Engineering. When Sequoia was acquired by Dominion Voting Systems in 2010, Eric joined the DVS team as Vice President of US Engineering overseeing development in the Denver, Colorado office.

Recently, Eric has taken over as the Director of Product Strategy driving the creation of next generation products through close collaboration with customers, combined with a deep understanding of technology and the needs of Elections departments throughout the United States and abroad. Eric has been an active participant in the development of the IEEE common data format for Elections systems, as well as the working group for developing standards for Risk-Limiting Audits for elections results. When not designing new products, Eric supports large and small scale customers during Election season."

I did some cursory research on Eric, but my conclusion was that he was either a part of the government or not relevant to the conversation. In other words, this was not a target I would

identify as being influential in Antifa. My conclusion was based on his credentials of having a PhD in Nuclear Physics. Did not add up for someone with that intelligence. I set it aside and concentrated my focus on the activist journalist who were actually Antifa members.

On October 15, 2020 I spoke at an FEC meeting in Bandimere Speedway. It was a rally around the unconstitutional actions of Jefferson County, Colorado government leadership to hurt Bandimere Speedway. I spoke and before the event started they escorted a suspected Antifa Journalist Erik Maulbetsch [Colorado Recorder] off the premises. In that meeting I talked about outing activist journalists who were Antifa and holding them accountable in our community for attacking organizations like FEC United that serve the community.

These activist journalists frequently slander people of faith, conservatives and call them names that defame them in the community. I had enough and warned that we would call them out by name. Maulbetsch wrote and article reflecting this as he was listening in online and decided to omit details about the meeting, causing the entire journalistic community to wonder if they were on the list. It had a positive effect contrary to their intentions.

On Friday November 6th, I received a forwarded a article about Georgia irregularities on the election day. I normally do not read many of these articles because I am inundated with information both from FEC, and my company. I started reading it and noticed Eric Coomer was the spokesperson for a company called Dominion Voting Systems. I immediately stopped and started to go back through my notes to find the info on Eric Coomer. I then started research Dominion Voting Systems. The information became rather scary as everywhere I looked I found Eric's name. Some listing him as VP of Security and others calling him Director of Strategy and Security. I began my search for everything Eric Coomer, Dr. Eric Coomer and any information related to legal filings, RFPs, states using Dominion, Colorado uses and even areas in Colorado that do not use Dominion.

I then turned my attention to Eric Coomer's Facebook profile and page while I gathered information on correlating email addresses, profiles, screen names, etc. Searching Twitter, Reddit, Facebook, 4Chan, etc etc.

I was able to get screenshots of Eric Coomer's Facebook posts going back to 2016. What I discovered was disturbing. Anti-Trump rhetoric, posts referring to: Fuck USA, Fuck the Police, A.C.A.B., posts that were anti Conservative, and even posts being happy someone died. Then the bigger shocker. He reposted the Antifa "Manifesto" letter to Donald Trump. I knew that I had the right guy and someone that was clearly mentally unstable and radical. I started digging into the

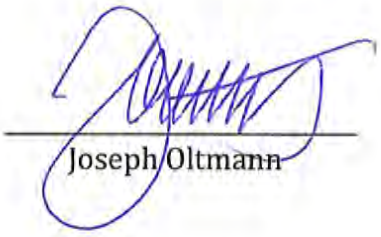
code irregularities and tying all of the pieces together with the irregularities and the Dominion uses in the disputed states. The correlation was astonishing. I then found the information related to justifying voting machines being online and his justification that they had "hardware and IP address protection". This statement by itself is FALSE.

I then attempted to reach out to all sources to bring this information to light. Calling major news stations and attempting to connect with the DOJ.

I took the information to the listeners of an organization that I also own called Conservative Daily. We have a podcast that we do on weekdays. I felt I had enough information and was confident that the Eric on the conference call was the same Eric Coomer that worked for Dominion. I was also confident that given the Facebook and other information I was able to collect that Eric Coomer was interfering with the election and as he admits in one of his posts that people at his company think and feel the same way he does. I began to research his patents, who owns them, the pattern of states they acquired as clients.

I began to research the connection to Diane Feinstein, her husband, campaign manager, Clinton Foundation and became worried that the finger of radicals had taken away the voice of the American people in deciding the election. I used ARIMA analysis to show me trends on data and probability models to prove that they were in fact using code and technology to ghost votes, switch votes or even remove probable ballots completely. Code is random unless it is not. Since we are a data company and understand artificial intelligence and use of neural networks, we understand the capabilities of creating chaos in outcome based on weighted density of probable voters.

These statements are true and accurate to the best of my knowledge.



Joseph Oltmann

STATE OF COLORADO
COUNTY OF Douglas

Personally appeared before me, LYNN KIEFFER, a Notary Public in and for the aforesaid State and County, JOSEPH T OLTMANN, the within named bargainer, with whom I am personally acquainted and who, after being duly sworn, acknowledged that she executed the foregoing Agreement for the purposes contained therein.

JOSEPH T OLTMANN

Sworn to and subscribed before me this 17th day of November, 2020.

DECLARATION OF HARRI HURSTI

Pursuant to 28 U.S.C. § 1746, I declare under penalty of perjury that the foregoing is true and correct.

1. My name is Harri Hursti. I am over the age of 21 and competent to give this testimony. The facts stated in this declaration are based on my personal knowledge, unless stated otherwise.

2. My background and qualifications in voting system cybersecurity are set forth in my December 16, 2019 declaration. (Doc. 680-1, pages 37 *et seq*). I stand by everything in that declaration and in my August 21, 2020 declaration. (Doc. 800-2).

3. I am also an expert in ballot scanning because of extensive background in digital imaging prior by work researching election systems. In addition, in 2005 I started an open source project for scanning and auditing paper ballots from images. As a result, I am familiar with different scanner types, how scanner settings and image processing features change the images, and how file format choices affect the quality and accuracy of the ballots.

4. I am engaged as an expert in this case by Coalition for Good Governance.

5. In developing this declaration and opinion, I visited Atlanta to observe certain operations of the June 9, 2020 statewide primary, and the August 11 runoff. During the June 9 election, I was an authorized poll watcher in some locations and was a public observer in others. On August 11, I was authorized as an expert inspecting and observing under the Coalition for Good Governance's Rule 34 Inspection request in certain polling places and the Fulton County Election Preparation Center. As I will explain below in this declaration, my extensive experience in the area of voting system security and my observations of these elections lead to additional conclusions beyond those in my December 16, 2019 declaration. Specifically:

a) the scanner and tabulation software settings being employed to determine which votes to count on hand marked paper ballots are likely causing clearly intentioned votes not to be counted;

b) the voting system is being operated in Fulton County in a manner that escalates the security risk to an extreme level; and

c) voters are not reviewing their BMD printed ballots, which causes BMD generated results to be un-auditable due to the untrustworthy audit trail.

Polling Place Observations

6. Election observation on Peachtree Christian Church. The ballot marking devices were installed so that 4 out of 8 touchscreen devices were clearly visible from the pollbook check in desk. Voter's selections could be effortlessly seen from over 50 ft away.

7. Over period of about 45 minutes, I only observed one voter who appeared to be studying the ballot after picking it up from the printer before casting it in the scanner. When voters do not fully verify their ballot prior to casting, the ballots cannot be considered a reliable auditable record.

8. The scanner would reject some ballots and then accept them after they were rotated to a different orientation. I noted that the scanner would vary in the amount of time that it took to accept or reject a ballot. The delay varied between 3

and 5 seconds from the moment the scanner takes the ballot until the scanner either accepts the ballot or rejects it. This kind of behavior is normal on general purpose operating systems multitasking between multiple applications, but a voting system component should be running only a single application without outside dependencies causing variable execution times.

9. Further research is necessary to determine the cause of the unexpected scanning delays. A system that is dedicated to performing one task repeatedly should not have unexplained variation in processing time. As security researcher, we are always suspicious about any unexpected variable delays, as those are common telltale signs of many issues, including a possibility of unauthorized code being executed. So, in my opinion changes of behaviors between supposedly identical machines performing identical tasks should always be investigated.

When ballots are the same and are produced by a ballot marking device, there should be no time difference whatsoever in processing the bar codes. Variations in time can be the result of many things - one of them is that the scanner encounters an error reading the bar code and needs to utilize error correcting algorithms to recover from that error. Further investigation is

necessary to determine the root cause of these delays, the potential impact of the error correcting algorithms if those are found to be the cause, and whether the delay has any impact upon the vote.

10. Election observation in Central Park Recreation Center. The Poll place manager told me that no Dominion trained technician had reported on location to help them that morning.

11. The ballot marking devices were originally installed in a way that voter privacy was not protected, as anyone could observe across the room how people are voting on about 2/3 devices.

12. The ballot scanner took between 4 and 6 seconds to accept the ballot. I observed only one ballot being rejected.

13. Generally, voters did not inspect the ballots after taking it from the printer and casting it into the scanner.

14. Election observation in Fanplex location. Samantha Whitley and Harrison Thweatt were poll watchers at the Fanplex polling location. They contacted me at approximately 9:10am about problems they were observing with the operation of the BMDs and Poll Pads and asked me to come to help them

understand the anomalies they were observing. I arrived at FanPlex at approximately 9:30am.

15. I observed that the ballot scanner located by a glass wall whereby standing outside of the building observe the scanning, would take between 6 and 7 seconds to either accept or reject the ballot.

16. For reasons unknown, on multiple machines, while voters were attempting to vote, the ballot marking devices sometimes printed "test" ballots. I was not able to take a picture of the ballot from the designated observation area, but I overheard the poll worker by the scanner explaining the issue to a voter which was sent back to the Ballot-Marking Device to pick up another ballot from the printer tray. Test ballots are intended to be used to test the system but without being counted by the system during an election. The ballot scanner in election settings rejects test ballots, as the scanners at FanPlex did. This caused confusion as the voters needed to return to the ballot-marking device to retrieve the actual ballot. Some voters returned the test ballot into the printer tray, potentially confusing the next voter. Had voters been reviewing the ballots at all before taking them to the scanner, they would have noticed the "Test Ballot" text on the ballot. I observed no voter really questioning a poll worker why a "Test" ballot was printed in the first place.

17. Obviously, during the election day, the ballot marking device should not be processing or printing any ballot other than the one the voter is voting. While the cause of the improper printing of ballots should be examined, the fact that this was happening at all is likely indicative of a wrong configuration given to the BMD, which in my professional opinion raises another question: Why didn't the device print only test ballots? And how can the device change its behavior in the middle of the election day? Is the incorrect configuration originating from the Electronic Pollbook System? What are the implications for the reliability of the printed ballot and the QR code being counted?

18. Election observation Park Tavern. The scanner acceptance delay did not vary as it had in previous locations and was consistently about 5 seconds from the moment the scanner takes the ballot, to the moment the scanner either accepts the ballot or rejects it. The variation between scanners at different locations is concerning because these are identical physical devices and should not behave differently while performing the identical task of scanning a ballot.

19. The vast majority of voters at Park Tavern did not inspect the ballots after taking them from the printer and before casting them in the scanner.

Fulton Tabulation Center Operation-Election Night, August 11, 2020

20. In Fulton County Election Preparation Center ("EPC") on election night I reviewed certain operations as authorized by Rule 34 inspection.

21. I was permitted to view the operations of the upload of the memory devices coming in from the precincts to the Dominion Election Management System ("EMS") server. The agreement with Fulton County was that I could review only for a limited period of time; therefore, I did not review the entire evening's process. Also, Dominion employees asked me to move away from the monitors containing the information and messages from the upload process and error messages, limiting my ability to give a more detailed report with documentation and photographs of the screens. However, my vantage point was more than adequate to observe that system problems were recurring and the Dominion technicians operating the system were struggling with the upload process.

22. It is my understanding the same EMS equipment and software had been used in Fulton County's June 9, 2020 primary election.

23. It is my understanding that the Dominion technician ("Dominic") charged with operating the EMS server for Fulton County had been performing

these duties at Fulton County for several months, including during the June 9 primary.

24. During my August 11 visit, and a follow-up visit on August 17, I observed that the EMS server was operated almost exclusively by Dominion personnel, with little interaction with EPC management, even when problems were encountered. In my conversations with Derrick Gilstrap and other Fulton County Elections Department EPC personnel, they professed to have limited knowledge of or control over the EMS server and its operations.

25. Outsourcing the operation of the voting system components directly to the voting system vendors' personnel is highly unusual in my experience and of grave concern from a security and conflict of interest perspective. Voting system vendors' personnel have a conflict of interest because they are not inclined to report on, or address, defects in the voting systems. The dangers this poses is aggravated by the absence of any trained County personnel to oversee and supervise the process.

26. In my professional opinion, the role played by Dominion personnel in Fulton County, and other counties with similar arrangements, should be considered an elevated risk factor when evaluating the security risks of Georgia's voting system.

27. Based on my observations on August 11 and August 17, Dell computers running the EMS that is used to process Fulton county votes appeared not to have been hardened.

28. In essence, hardening is the process of securing a system by reducing its surface of vulnerability, which is larger when a system performs more functions; in principle it is to the reduce the general purpose system into a single-function system which is more secure than a multipurpose one. Reducing available ways of attack typically includes changing default passwords, the removal of unnecessary software, unnecessary usernames or logins, grant accounts and programs with the minimum level of privileges needed for the tasks and create separate accounts for privileged operations as needed, and the disabling or removal of unnecessary services.

29. Computers performing any sensitive and mission critical tasks such as elections should unquestionably be hardened. Voting system are designated by the Department of Homeland Security as part of the critical infrastructure and certainly fall into the category of devices which should be hardened as the most fundamental security measure. In my experience, it is unusual, and I find it unacceptable for an EMS server not to have been hardened prior to installation.

30. The Operating System version in the Dominion Election Management computer, which is positioned into the rack and by usage pattern appears to be the main computer, is Windows 10 Pro 10.0.14393. This version is also known as the Anniversary Update version 1607 and it was released August 2, 2016. Exhibit A is a true and correct copy of a photograph that I took of this computer.

31. When a voting system is certified by the EAC, the Operating System is specifically defined, as Windows 10 Pro was for the Dominion 5.5-A system. Unlike consumer computers, voting systems do not and should not receive automatic "upgrades" to newer versions of the Operating System. without undergoing tests for conflicts with the new operating system software.

32. That computer and other computers used in Georgia's system for vote processing appear to have home/small business companion software packages included. Exhibits B and C are true and correct copies of photographs that I took of the computer located in the rack and the computer located closest to the rack on the table to the right. The Start Menu shows a large number of game and entertainment software icons. As stated before, one of the first procedures of hardening is removal of all unwanted software, and removal of those game icons and the associated games and installers alongside with all other software which is not absolutely needed in the computer for election processing purposes would be

one of the first and most basic steps in the hardening process. In my professional opinion, independent inquiry should be promptly made of all 159 counties to determine if the Dominion systems statewide share this major deficiency.

33. Furthermore, when I asked the Dominion employee Dominic assigned to the Fulton County election server operation about the origin of the Windows operating system, he answered that he believed that "it has been provided by the State."

34. Since Georgia's Dominion system is new, it is a reasonable assumption that all machines in the Fulton County election network had the same version of Windows installed. However, not only the two computers displayed different entertainment software icons, but additionally one of the machines in Fulton's group of election servers had an icon of computer game called "*Homescapes"* which is made by Playrix Holding Ltd., founded by Dmitry and Igor Bukham in Vologda, Russia. Attached as Exhibit C is a true and correct copy of a photograph that I took of the Fulton voting system computer" Client 02". The icon for Homescapes is shown by the arrow on Exhibit C.

35. The *Homescapes* game was released in August 2017, one year after Fulton County's operating system release. If the *Homescapes* game came with the operating system it would be unusual, because at the time of the release of

Homescapes, Microsoft had already released 3 major Microsoft Windows 10 update releases after build 14393 and before the release of that game. This calls into question whether all Georgia Dominion system computers have the same operating system version, or how the game has come to be having a presence in Fulton's Dominion voting system.

36. Although this Dominion voting system is new to Georgia, the Windows 10 operating system of at least the 'main' computer in the rack has not been updated for 4 years and carries a wide range of well-known and publicly disclosed vulnerabilities. At the time of this writing, The National Vulnerability Database maintained by National Institute of Standards and Technology lists 3,177 vulnerabilities mentioning "Windows 10 Pro" and 203 vulnerabilities are specifically mentioning "Windows 10 Pro 1607" which is the specific version number of the build 14393 that Dominion uses.

37. Even without internet connectivity, unhardened computers are at risk when those are used to process removable media. It was clear that when Compact Flash storage media containing the ballot images, audit logs and results from the precinct scanners were connected to the server, the media was automounted by the operating system. When the operating system is automounting a storage media, the operating system starts automatically to interact with the device. The zero-day

vulnerabilities exploiting this process has been recurringly discovered from all operating systems, including Windows. Presence of automount calls also into question presence of another setting which is always disabled in hardening process. It is autorun, which automatically executes some content on the removable media. While this is convenient for consumers, it poses extreme security risk.

38. Based on my experience and mental impression observing the Dominion technician's activities, Fulton County's EMS server management seems to be an *ad hoc* operation with no formalized process. This was especially clear on the manual processing of the memory cards storage devices coming in from the precincts on election night and the repeated access of the operating system to directly access filesystem, format USB devices, etc. This kind of operation in naturally prone to human errors. I observed personnel calling on the floor asking if all vote carrying compact flash cards had been delivered from the early voting machines for processing, followed by later finding additional cards which had been overlooked in apparent human error. Later, I heard again one technician calling on the floor asking if all vote carrying compact flashes had been delivered. This clearly demonstrates lack of inventory management which should be in place to ensure, among other things, that no rogue storage devices would be inserted into the computer. In response, 3 more compact flash cards were hand-delivered. Less

than 5 minutes later, I heard one of the county workers say that additional card was found and was delivered for processing. All these devices were trusted by printed label only and no comparison to an inventory list of any kind was performed.

39. In addition, operations were repeatedly performed directly on the operating system. Election software has no visibility into the operations performed directly on the operating system, and therefore those are not included in election system event logging. Those activities can only be partially reconstructed from operating system logs – and as these activities included copying election data files, election software log may create false impression that the software is accessing the same file over a period of time, while in reality the file could had been replaced with another file with the same name by activities commanded to the operating system. Therefore, any attempt to audit the election system operated in this manner must include through analysis of all operating system logs, which complicates the auditing process. Unless the system is configured properly to collect file system auditing data is not complete. As the system appears not to be hardened, it is unlikely that the operating system has been configured to collect auditing data.

40. A human error when operating live election system from the operating system can result in a catastrophic event destroying election data or even rendering the system unusable. Human error is likely given the time pressure involved and,

at least in Fulton County, no formal check lists or operating procedures were followed to mitigate the human error risk. The best practice is to automate trivial tasks to reduce risk of human error, increase the quality assurance of overall operations and provide auditability and transparency by logging.

41. Uploading of memory cards had already started before I arrived at EPC. While one person was operating the upload process, the two other Dominion employees were troubleshooting issues which seemed to be related to ballot images uploads. I repeatedly observed error messages appearing on the screen of the EMS server. I was not able to get picture of the errors on August 11th, I believe the error was the same or similar that errors recurring August 17th as shown on Exhibit D and discussed later in this declaration. Dominion employees were troubleshooting the issue with 'trial-and-error' approach. As part of this effort they accessed "Computer Management" application of Windows 10 and experimented with trouble shooting the user account management feature. This demonstrates that they had complete access to the computer. This means there are no meaningful access separation and privileges and roles controls protecting the county's primary election servers. This also greatly amplifies the risk of catastrophic human error and malicious program execution.

42. I overheard the Dominion technician's conversation that they had issues with file system structure and "need 5 files out of EMS server and paste. Delete everything out of there and put it there." To communicate the gravity of the situation to each other they added "Troubleshooting in the live environment". These conversations increased the mental image that they were not familiar the issue they were troubleshooting.

43. After about 45 minutes of trying to solve the issue by instructions received over the phone, the two Dominion employees' (who had been troubleshooting) behavior changed. The Dominion staff member walked behind the server rack and made manual manipulations which could not be observed from my vantage point. After that they moved with their personal laptops to a table physically farther away from the election system and stopped trying different ways to work around the issue in front of the server, and no longer talked continuously with their remote help over phone.

44. In the follow-up-calls I overheard them ask people on the other end of the call to check different things, and they only went to a computer and appeared to test something and subsequently take a picture of the computer screen with a mobile phone and apparently send it to a remote location.

45. Based on my extensive experience, this all created a strong mental impression that the troubleshooting effort was being done remotely over remote access to key parts of the system. Additionally, new wireless access point with a hidden SSID access point name appeared in the active Wi-Fi stations list that I was monitoring, but it may have been co-incidental. Hidden SSIDs are used to obscure presence of wireless networking from casual observers, although they do not provide any real additional security.

46. If in fact remote access was arranged and granted to the server, this has gravely serious implications for the security of the new Dominion system. Remote access, regardless how it is protected and organized is always a security risk, but furthermore it is transfer of control out of the physical perimeters and deny any ability to observe the activities.

47. I also observed USB drives marked with the Centon DataStick Pro Logo with no visible inventory control numbering system being taken repeatedly from the EMS server rack to the Fulton managers' offices and back. The Dominion employee told me that the USB drives were being taken to the Election Night Reporting Computer in another office. This action was repeated several times during the time of my observation. Carrying generic unmarked and therefore unidentifiable media out-of-view and back is a security risk – especially when the

exact same type of devices was piled on the desk near the computer. During the election night, the Dominion employees reached to storage box and introduced more unmarked storage devices into the ongoing election process. I saw no effort made to maintain a memory card inventory control document or chain of custody accounting for memory cards from the precincts.

48. I also visited the EPC on August 17. During that visit, the staff working on uploading ballots for adjudication experienced an error which appeared similar to the one on election night. This error was repeated with multitude of ballots and at the time we left the location, the error appeared to be ignored, rather that resolved. (EXHIBIT D - the error message and partial explanation of the error being read by the operator.).

49. The security risks outlined above – operating system risks, the failure to harden the computers, performing operations directly on the operating systems, lax control of memory cards, lack of procedures, and potential remote access, are extreme and destroy the credibility of the tabulations and output of the reports coming from a voting system.

50. Such a risk could be overcome if the election were conducted using hand marked paper ballots, with proper chain of custody controls. For elections conducted with hand marked paper ballots, any malware or human error involved

in the server security deficiencies or malfunctions could be overcome with a robust audit of the hand marked paper ballots and in case of irregularities detected, remedied by a recount. However, given that BMD ballots are computer marked, and the ballots therefore unauditable for determining the result, no recovery from system security lapses is possible for providing any confidence in the reported outcomes.

Ballot Scanning and Tabulation of Vote Marks

51. I have been asked to evaluate the performance and reliability of Georgia's Dominion precinct and central count scanners in the counting of votes on hand marked paper ballots.

52. On or about June 10th, Jeanne Dufort and Marilyn Marks called me to seek my perspective on what Ms. Dufort said she observed while serving as a Vote Review Panel member in Morgan County. Ms. Dufort told me that she observed votes that were not counted as votes nor flagged by the Dominion adjudication software.

53. Because of the ongoing questions this raised related to the reliability of the Dominion system tabulation of hand marked ballots, I was asked by Coalition Plaintiffs to conduct technical analysis of the scanner and tabulation accuracy. That analysis is still in its early stages.

54. Before addressing the particulars of my findings and research into the accuracy of Dominion's scanning and tabulation, I will address the basic process by which an image on a voted hand marked paper ballot is processed by scanner and tabulation software generally. It is important to understand that the Dominion scanners are Canon off the shelf scanners and their embedded software were designed for different applications than ballot scanning which is best conducted with scanners specifically designed for detecting hand markings on paper ballots.

55. Contrary of public belief, the scanner is not taking a picture of the paper. The scanner is illuminating the paper with a number of narrow spectrum color lights, typically 3, and then using software to produce an approximation what the human eye would be likely to see if there would had been a single white wide-spectrum light source. This process takes place in partially within the scanner and embedded software in the (commercial off the shelf) scanner and partially in the driver software in the host computer. It is guided by number of settings and configurations, some of which are stored in the scanner and some in the driver software. The scanner sensors gather more information than will be saved into the resulting file and another set of settings and configurations are used to drive that part of the process. The scanners also produce anomalies which are automatically removed from the images by the software. All these activities are performed

outside of the Dominion election software, which is relying on the end product of this process as the input.

56. I began reviewing Dominion user manuals in the public domain to further investigate the Dominion process.

57. On August 14, I received 2 sample Fulton County August 11 ballots of high-speed scanned ballot from Rhonda Martin, who stated that she obtained them from Fulton County during Coalition Plaintiff's discovery. The image characteristics matched the file details I had seen on the screen in EPC. The image is TIFF format, about 1700 by 2200 pixels with 1-bit color depth (= strictly black or white pixels only) with 200 by 200 dots per square inch ("dpi") resolution resulting in files that are typically about 64 or 73 kilo bytes in size for August 11 ballots. With this resolution, the outer dimension of the oval voting target is about 30 by 25 pixels. The oval itself (that is, the oval line that encircles the voting target) is about 2 pixels wide. The target area is about 450 pixels; the area of the target a tight bounding box would be 750 pixels and the oval line encircling the target is 165 pixels. In these images, the oval itself represented about 22% value in the bounding box around the vote target oval.

58. Important image processing decisions are done in scanner software and before election software threshold values are applied to the image. These

scanner settings are discussed in an excerpt Dominion's manual for ICC operations My understanding is that the excerpt of the Manual was received from Marilyn Marks who stated that she obtained it from a Georgia election official in response to an Open Records request. Attached as Exhibit E is page 9 of the manual. Box number 2 on Exhibit E shows that the settings used are not neutral factory default settings.

59. Each pixel of the voters' marks on a hand marked paper ballot will be either in color or gray when the scanner originally measures the markings. The scanner settings affect how image processing turns each pixel from color or gray to either black or white in the image the voting software will later process. This processing step is responsible for major image manipulation and information reduction before the election software threshold values are calculated. This process has a high risk of having an impact upon how a voter mark is interpreted by the tabulation software when the information reduction erases markings from the scanned image before the election software processes it.

60. In my professional opinion, any decision by Georgia's election officials about adopting or changing election software threshold values is premature before the scanner settings are thoroughly tested, optimized and locked.

61. The impact of the scanner settings is minimal for markings made with a black felt pen but can be great for markings made with any color ballpoint pens. To illustrate this, I have used standard color scanning settings and applied then standard conversion from a scanned ballot vote target with widely used free and open source image processing software "GNU Image Manipulation Program version 2.10.18" EXHIBIT G shows the color image being converted with the software's default settings from color image to Black-and-White only. The red color does not meet the internal conversion algorithm criteria for black, therefore it gets erased to white instead.

62. Dominion manual for ICC operations clearly show that the scanner settings are changed from neutral factory default settings. EXHIBIT H shows how these settings applied different ways alter how a blue marking is converted into Black-and-White only image.

63. The optimal scanner settings are different for each model of scanner and each type of paper used to print ballots. Furthermore, because scanners are inherently different, the manufacturers use hidden settings and algorithms to cause neutral factory settings to produce similar baseline results across different makes and models. This is well-studied topic; academic and image processing studies published as early as 1979 discuss the brittleness of black-or-white images in

conversion. Subsequently, significance for ballot counting has been discussed in academic USENIX conference peer-reviewed papers.

64. On the August 17th at Fulton County Election Preparation Center Professor Richard DeMillo and I participated in a scan test of August 11 test ballots using a Fulton County owned Dominion precinct scanner. Two different ballot styles were tested, one with 4 races and one with 5 races. Attached as Exhibits I and J show a sample ballots with test marks.

65. A batch of 50 test ballots had been marked by Rhonda Martin with varying types of marks and varying types of writing instruments that a voter might use at home to mark an absentee ballot. Professor DeMillo and I participated in marking a handful of ballots.

66. Everything said here concerning the August 17 test is based on a very preliminary analysis. The scanner took about 6 seconds to reject the ballots, and one ballot was only acceptable "headfirst" while another ballot only "tail first." Ballot scanners are designed to read ballots "headfirst" or "tail first," and front side and backside and therefore there should not be ballots which are accepted only in one orientation. I observed the ballots to make sure that both ballots had been cleanly separated from the stub and I could not identify any defects of any kind on the ballots.

67. There was a 15 second cycle from the time the precinct scanner accepted a ballot to the time it was ready for the next ballot. Therefore, the maximum theoretical capacity with the simple 5 race ballot is about 4 ballots per minute if the next ballot is ready to be fed into the scanner as soon as the scanner was ready to take it. In a real-world voting environment, it takes considerably longer because voters move away from the scanner, the next voter must move in and subsequently figure where to insert the ballot. The Dominion precinct scanner that I observed was considerably slower than the ballot scanners I have tested over the last 15 years. This was done with a simple ballot, and we did not test how increase of the number of races or vote targets on the ballot would affect the scanning speed and performance.

68. Though my analysis is preliminary, this test reveals that a significant percentage of filled ovals that would to a human clearly show voter's intent failed to register as a vote on the precinct count scanner.

69. The necessary testing effort has barely begun at the time of this writing, as only limited access to equipment has been made available. I have not had access to the high-volume mail ballot scanner that is expected to process millions of mail ballots in Georgia's upcoming elections. However, initial results suggest that significant revisions must be made in the scanning settings to avoid a

widespread failure to count certain valid votes that are not marked as filled in ovals. Without testing, it is impossible to know, if setting changes alone are sufficient to cure the issue.

Scanned Ballot Tabulation Software Threshold Settings

70. Georgia is employing a Dominion tabulation software tool called "Dual Threshold Technology" for "marginal marks." (See Exhibit M) The intent of the tool is to detect voter marks that could be misinterpreted by the software and flag them for review. While the goal is admirable, the method of achieving this goal is quite flawed.

71. While it is compelling from development cost point of view to use commercial off the shelf COTS scanners and software, it requires additional steps to ensure that the integration of the information flow is flawless. In this case, the software provided by the scanner manufacturer and with settings and configurations have great impact in how the images are created and what information is removed from the images before the election software processes it. In recent years, many defective scanner software packages have been found. These software flaws include 'image enhancement' features which have remained enabled even when the feature has been chosen to be disabled from the scanner software provided by the manufacturer. An example of dangerous feature to keep

enabled is 'Punch Hole Removal', intended to make images of documents removed from notebook binders to look more aesthetically pleasing. The software can and in many cases will misinterpret a voted oval as a punch hole and erase the vote from the image file and to make this worse, the punch holes are expected to be found only in certain places near the edge of the paper, and therefore it will erase only votes from candidates whose targets are in those target zones.

72. Decades ago, when computing and storage capacity were expensive black-and-white image commonly meant 1-bit black-or-white pixel images like used by Dominion system. As computer got faster and storage space cheaper during the last 2-3 decades black-and-white image has become by default meaning 255 shades of gray grayscale images. For the purposes of reliable digitalization of physical documents, grayscale image carries more information from the original document for reliable processing and especially when colored markings are being processed. With today's technology, the difference in processing time and storage prices between grayscale and 1-bit images has become completely meaningless, and the benefits gained in accuracy are undeniable.

73. I am aware that the Georgia Secretary of State's office has stated that Georgia threshold settings are national industry standards for ballot scanners (Exhibit K). This is simply untrue. If, there were an industry standard for that, it

would be part of EAC certification. There is no EAC standard for such threshold settings. As mentioned before, the optimal settings are products of many elements. The type of the scanner used, the scanner settings and configuration, the type of the paper used, the type of the ink printer has used in printing the ballots, color dropout settings, just to name few. Older scanner models, which were optical mark recognitions scanners, used to be calibrated using calibration sheet – similar process is needed to be established for digital imaging scanners used this way as the ballot scanners.

74. Furthermore, the software settings in Exhibit E box 2 show that the software is instructed to ignore all markings in red color ("Color drop-out: Red"), This clearly indicates that the software was expecting the oval to be printed in Red and therefore it will be automatically removed from the calculation. The software does not anticipate printed black ovals as used in Fulton County. Voters have likely not been properly warned that any pen they use which ink contains high concentration of red pigment particles is at risk of not counting, even if to the human eye the ink looks very dark.

75. I listened to the August 10 meeting of the State Board of Elections as they approved a draft rule related to what constitutes a vote, incorporating the following language:

> *Ballot scanners that are used to tabulate optical scan ballots marked by hand shall be set so that:*
>
> *1. Detection of 20% or more fill-in of the target area surrounded by the oval shall be considered a vote for the selection;*
>
> *2. Detection of less than 10% fill-in of the target area surrounded by the oval shall not be considered a vote for that selection;*
>
> *3. Detection of at least 10% but less than 20% fill-in of the target area surrounded by the oval shall flag the ballot for adjudication by a vote review panel as set forth in O.C.G.A. 21-2-483(g). In reviewing any ballot flagged for adjudication, the votes shall be counted if, in the opinion of the vote review panel, the voter has clearly and without question indicated the candidate or candidates and answers to questions for which such voter desires to vote.*

76. The settings discussed in the rule are completely subject to the scanner settings. How the physical marking is translated into the digital image is determined by those values and therefore setting the threshold values without at the same time setting the scanner settings carries no value or meaning. If the ballots will be continuing to be printed with black only, there is no logic in having any drop-out colors.

77. Before the State sets threshold standards for the Dominion system, extensive testing is needed to establish optimal configuration and settings for each step of the process. Also, the scanners are likely to have settings additional configuration and settings which are not visible menus shown in the manual excerpt. All those should be evaluated and tested for all types of scanners approved for use in Georgia, including the precinct scanners

78. As temporary solution, after initial testing, the scanner settings and configuration should be locked and then a low threshold values should be chosen. All drop-out colors should be disabled. This will increase the number of ballots chosen for human review and reduce the number of valid votes not being counted as cast.

Logic and Accuracy Testing

79. Ballot-Marking Device systems inherits the same well-documented systemic security issues embedded in direct-recording electronic (DRE) voting machine design. Such design flaws eventually are causing the demise of DRE voting system across the country as it did in Georgia. In essence the Ballot Marking Device is a general-purpose computer running a general-purpose operating system with touchscreen that is utilized as a platform to run a software, very similar to DRE by displaying a ballot to the voter and recording the voter's intents. The main difference is that instead of recording those internally digitally, it prints out a ballot summary card of voter's choices.

80. Security properties of this approach would be positively different from DREs if the ballot contained only human-readable information and all voters are required to and were capable of verifying their choices from the paper ballot summary. That of course is unrealistic.

81. When voter fails to inspect the paper ballot and significant portion of the information is not in human readable from as a QR barcode, Ballot-Marking Device based voting effectively inherits most of the negative and undesirable security and reliability properties directly from DRE paradigm, and therefore should be subject to the same testing requirements and mitigation strategies as DREs.

82. In response to repeating myriad of issues with DREs, which have been attributed to causes from screen calibration issues to failures in ballot definition configuration distribution, a robust Logic & Accuracy testing regulation have been established. These root causes are present in BMDs and therefore should be evaluated in the same way as DREs have been.

I received the Georgia Secretary of State's manual "Logic and Accuracy Procedures "Version 1.0 January 2020 from Rhonda Martin. Procedure described in section D "Testing the BMD and Printer" is taking significant shortcuts, presumably to cut the labor work required. (Section D is attached as Exhibit L) These shortcuts significantly weaken the security and reliability posture of the system and protections against already known systemic pitfalls, usability predicaments and security inadequacies.

CONCLUSIONS

83. The scanner software and tabulation software settings and configurations being employed to determine which votes to count on hand marked paper ballots are likely causing clearly intentioned votes not to be counted as cast.

84. The method of using 1-bit images and calculated relative darkness values from such pre-reduced information to determine voter marks on ballots is severely outdated and obsolete. It artificially and unnecessarily increases the failure rates to recognize votes on hand-marked paper ballots. As a temporary mitigation, optimal configurations and settings for all steps of the process should be established after robust independent testing to mitigate the design flaw and augment it with human assisted processes, but that will not cure the root cause of the software deficiency which needs to be addressed.

85. The voting system is being deployed, configured and operated in Fulton County in a manner that escalates the security risk to an extreme level and calls into question the accuracy of the election results. The lack of well-defined process and compliance testing should be addressed immediately using independent experts. The use and the supervision of the Dominion personnel operating Fulton County's Dominion Voting System should be evaluated.

86. Voters are not reviewing their BMD printed ballots before scanning and casting them, which causes BMD-generated results to be un-auditable due to the untrustworthy audit trail. Furthermore, because BMDs are inheriting known fundamental architectural deficiencies from DREs, no mitigation and assurance measures can be weakened, including but not limited to Logic and Accuracy Testing procedures.

This 24th day of August 2020.

993-SC13

OFFICIAL ABSENTEE/PROVISIONAL/EMERGENCY BALLOT

OFFICIAL DEMOCRATIC PARTY PRIMARY AND
NONPARTISAN GENERAL ELECTION RUNOFF BALLOT
OF THE STATE OF GEORGIA
AUGUST 11, 2020

To vote, blacken the Oval (●) next to the candidate of your choice. To vote for a person whose name is not on the ballot, manually WRITE his or her name in the write-in section and blacken the Oval (●) next to the write-in section. If you desire to vote YES or NO for a PROPOSED QUESTION, blacken the corresponding Oval (●). Use only blue or black pen or pencil.

Do not vote for more candidates than the number allowed for each specific office. Do not cross out or erase. If you erase or make other marks on the ballot or tear the ballot, your vote may not count.

If you change your mind or make a mistake, you may return the ballot by writing "Spoiled" across the face of the ballot and return envelope. You may then mail the spoiled ballot back to your county board of registrars, and you will be issued another official absentee ballot. Alternatively, you may surrender the ballot to the poll manager of an early voting site within your county or the precinct to which you are assigned. You will then be permitted to vote a regular ballot.

"I understand that the offer or acceptance of money or any other object of value to vote for any particular candidate, list of candidates, issue, or list of issues included in this election constitutes an act of voter fraud and is a felony under Georgia law." [O.C.G.A. 21-2-284(e) and 21-2-383(e)]

For State Representative In the General Assembly From 65th District
(Vote for One)

Gabriel Sterling
@GabrielSterling

Replying to @MarilynRMarks1 @rahulbali and 9 others

Again, all Central scanners were set at the industry standard 0-13% is not a mark (the oval is 5%) 14-28% is the ambiguous level to be checked by review panels, 29%+ is a mark. You ar pointing out the inherent issues with HMPBs that we don't see with BMD marked ballots.

8:02 PM · Jun 13, 2020 from Georgia, USA · Twitter for iPhone

EXHIBIT L:

- Create a voter card from Poll Pad for each unique ballot style within the designated Polling Location
  - Recommend labels be placed on card identifying what ballot style will be displayed by BMD once card is inserted
  - BMD removes the activation code from the Voter Card once used, therefore create the card again from Poll Pad after each use by a BMD

D. Testing the BMD and Printer

Use a combination of Poll Worker Card with Ballot Activation Codes for the polling location, and Voter Cards created from a Poll Pad loaded with the LA/Advance Voting dataset to bring up ballots on the BMD

- Produce at least one printed ballot from each BMD assigned to the polling location
- Produce a test deck from the BMDs assigned to the polling location for each unique ballot style within the polling location. The test deck must contain at least one vote for each candidate listed in each race within the unique ballot style
  - **Example**: Ballot from BMD 1 contains a vote for only the first candidate in each race listed on Ballot Style 1, Ballot from BMD 2 contains a vote only for the second candidate in each race on Ballot Style 1, and continue through the line of devices until all candidates in all races within the unique ballot style have received a single vote
  - **If Number of BMDs outnumber the number of vote positions on the unique ballot style**, start the vote pattern over until all BMDs have produced one printed ballot
  - **If Number of unique ballot styles in the polling place is greater than 1,** once the vote pattern is complete for a unique ballot style, proceed to the next BMD in line to start the review of the next unique Ballot Style
  - **All unique ballot styles do not have to be tested on each BMD**
- Review BMD-generated Test Deck and confirm the vote content before placing in the designated Polling Place Scanner

E. Testing the Polling Place Scanner

- Scan the BMD-generated Test Deck into the Polling Place Scanner
- Scan one blank optical scan ballot style(s) associated to the Polling Place to verify the Polling Place Scanner will recognize the ballot style in case of emergency
- Verify Scanner(s) shows a number of Ballot Cast equal to the number of ballots in the BMD-generated test deck plus the scanned blank Optical Scan ballot styles
- Firmly place the Security Key Tab in the Security Key Slot
- Touch Close Polls
- Enter the passcode
- Touch Enter
- Touch Yes
- Touch No for additional tapes (Scanner will automatically produce 3 copies of the closing tape)

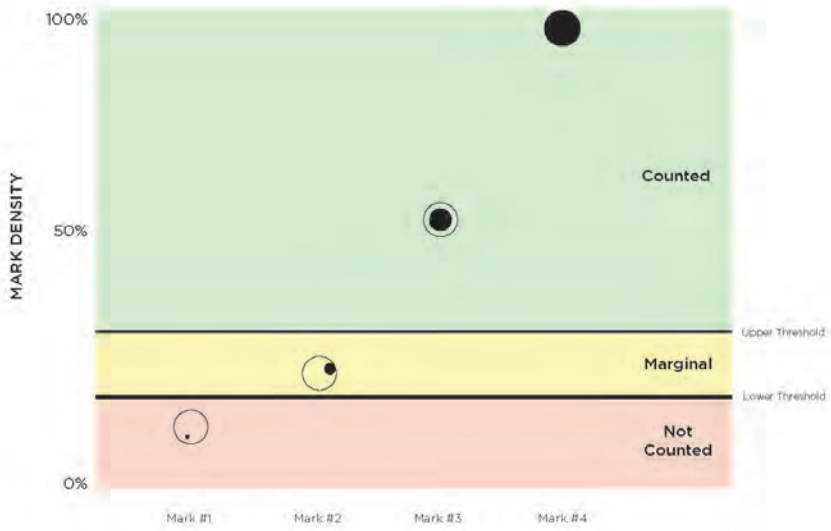
EXHIBIT M:

THE DOMINION DIFFERENCE

DUAL THRESHOLD TECHNOLOGY (MARGINAL MARKS)

From its early beginnings, Dominion Voting has emphasized the use of digital scanning, and continues to set the standard in digital image acquisition and analysis in the tabulation of digitally scanned ballots. When a ballot is fed into an ImageCast® tabulator – at the precinct level or centrally - a complete duplex image is created and then analyzed for tabulation by evaluating the pixel count of a voter mark. The pixel count of each mark is compared with two thresholds (which can be defined through the Election Management System) to determine what constitutes a vote. If a mark falls above the upper threshold, it's a valid vote. If a mark falls below the lower threshold, it will not be counted as a vote.

However, if a mark falls between the two thresholds (known as the "ambiguous zone"), it will be deemed as a marginal mark and the ballot will be returned to the voter for corrective action (please see diagram below). With this feature, the voter is given the ability to determine his or her intent, not an inspection or recount board after the fact, when it is too late. The chart below illustrates the Marginal Mark threshold interpretation.



THE DOMINION DIFFERENCE DUAL THRESHOLD TECHNOLOGY DOMINION VOTING

STATEMENT BY ANA MERCEDES DÍAZ CARDOZO

I, Ana Mercedes Díaz Cardozo, hereby declare the following:

1. My name is Ana Mercedes Díaz Cardozo. I'm known as Ana Diaz by many. I am an adult of the sound mine and was born in Caracas, Venezuela on March 24, 1960. I'm a naturalized American citizen. I reside at 923 Gulf Stream Court, Weston, Florida 33327.

2. I make this statement voluntarily and on my own initiative. I have not been promised, nor do I expect to receive anything in exchange for my testimony and give this statement. I have no expectation of any benefit or reward and understand that there are those who can try to hurt me for what I say in this statement.

3. I moved from Venezuela to the United States in 2004 due to political corruption and rapid decline in my home country of Venezuela. I want to alert the public and let the world know the truth about corruption, manipulation, and lies committed through a conspiracy of individuals and businesses with the intention of betraying the honest people of the United States and its legally constituted institutions and fundamental rights as citizens. This conspiracy began more than a decade ago in Venezuela and has spread to countries around the world. It is a conspiracy to unjustly gain and maintain power and wealth. These are political leaders, powerful companies, and others whose purpose is to gain and maintain power by changing people's free will and subverting the proper course of governing.

4. After graduating from high school, I attended the University of Santa Maria in Caracas, Venezuela and graduated as a lawyer in 1987. Then I studied a postgraduate degree in administrative law at the University of Central Venezuela. Before I could submit my thesis for a Master's degree in Administrative Law, I moved to the United States. I'm certified as an arbiter of international trade.

5. I was a career official for 25 years at the Supreme Electoral Council of Venezuela, which is the name that it was called in the 1970's. It is currently called the National Electoral Council. This is the highest electoral administrative agency in Venezuela and oversees all elections in Venezuela. In 1979, at the age of 19, I began my career at the Supreme Electoral Council of Venezuela as secretary in the regional delegation of the federal district. When I graduated from the university as a lawyer, my position on the Supreme Electoral Council changes to the position as an adviser to the Judicial Council of the Supreme Council Electoral. In 1991, I was appointed Assistant Director General of Political Parties, where I served until Hugo Chavez came to power in 1998. Also during this time, I served for seven years as a member of the Legislative Commission of the Venezuelan Electoral Council. It was the role of the Legislative Commission to review and identify any issues related to candidates

for elected positions. The Legislative Commission and my office had access to many resources within the various departments of the Electoral Council, including an information technology section that had experts in computers, computer programming, computer systems and telecommunications features such as modems, telephone lines. I was regularly in communication with the various departments of the Electoral Body for my daily duties. In the last years of my work for the Electoral Counsel, a little of my activities and duties were to learn about electronic voting systems and their functioning by Council experts.

6. As Deputy Director General of Political Parties in the Supreme Electoral Council, it was my duty to oversee everything related to political parties in Venezuela, particularly the participation of political parties in elections and the selection and qualifications of candidates for political office. My office reviewed everything to do with the ability of political parties to participate in the electoral process. Before a political party could be formed, it had to undergo a process for approval. This included legal approval of the party name, its colors and a list of its members. The proposed party had to have a certain percentage of Venezuela's population depending on whether it wanted to be a regional or national party. It could not be constituted as a political party until it was approved by the Supreme Electoral Council. My office also oversaw the creation of ballots that bore the name of the candidates and any party symbol or color that the candidate would like to use. When our office approved these matters, we sent the ballot for printing and circulation. Any conflict over which group could be a political party, which would be a candidate for elected office, how that candidate would be included in the vote, were decided by my office. I was a signatory to all decisions taken by the Political Parties office at the Supreme Electoral Council.

7. After Hugo Chavez was elected, he changed the Venezuelan Constitution. One such change was in the Supreme Electoral Council, now the Electoral Power. In February 2009, a national referendum was passed to change Venezuela's Constitution to end mandate limits for elected officials, including the President of Venezuela. This change allowed Hugo Chavez to be re-elected an unlimited number of times.

8. In 2003, I was appointed Director General of Political Parties at the National Electoral Council. At the end of that year there was a national effort to hold a referendum to remove Hugo Chavez from the post of President. In 2004 I was appointed to the Validation Committee that was responsible for reviewing petitions, the requirements of the signatories were their name, their signature, their fingerprint and their identification number. I discovered many ways that the party in power was trying to override requests. One was the change of forms to reflect that the petition was a referendum on the removal of members of the Venezuelan Congress

rather than the removal of the Venezuelan president. The purpose of manipulating petitions was to prevent a referendum to remove President Chavez from office. I investigated the allegations of fraud with the referendum petitions and lobbied for the fraudulent changes to be rectified. Because of my resistance and protests to this voter fraud, I received a letter in March 2004 stating that my position was trusted and trust had been lost in me and I was fired from the service.

9. After my dismissal, I decided to commit to the study of electoral processes both within Venezuela and in other countries, particularly in South American countries that were experiencing electoral unrest and government manipulation of constitutions, laws and elections. I joined a small group of highly educated and informed people who had access to information about the Venezuelan government and its activities. This group and I conduct interviews with Venezuelan citizens, read news publications and specialized treaties, and write evaluating the political, economic, legal and electoral changes taking place in Venezuela, South American countries, and other parts of the world controlled by socialist dictators and oligarchies. I read these treatises, studies, and publications to educate myself on how elections were manipulated and the use of empirical analysis to detect and identify the manipulation of elections and their results. In addition, I have collected copies of official Venezuelan government documents.

10. Official documents of the Venezuelan government include documents showing the bidding process for the implementation of a new electronic voting system in March 2004 and the award of the contract for that new system to Smartmatic. A true and authentic copy of the venezuelan National Electoral Council's tender documents, internal memorandums and contract signed between the Venezuelan government and the SBC Consortium (Smartmatic) are labeled Exhibit 1 and this statement is attached. I received the documents that constitute Exhibit 1 from a reliable person who had taken some notes on the documents and highlighted some parts for my attention. I have not made any alterations to what I have received, and the substantive content of the documents is authentic. For convenience, I've had the Bates document tagged at the bottom right of each page.

11. I have studied the documents contained in Exhibit 1 and have several observations. Exhibit 1 says that it is a contract between the National Electoral Council and the SBC Consortium (Smartmatic) and is dated 15 March 2004. It has a stamp that says Bolivarian Republic of Venezuela, Secretary General of the National Electoral Council. That is the official seal of the Secretary of the National Electoral Council. The initials at the bottom right side confirm the document's authenticity.

12. You would notice that page DIAZ 00002 is important because it shows that the contract is being made on February 16, 2004. Page DIAZ 00027, reflects that on February 14, 2004 at 11:50 a.m., in the Council's session room, Francisco Carrasquero López, Ezequiel Zamora Presilla, Jorge Rodríguez Gómez (Jorge Rodríguez), Sobella Mejías, and William Pacheco Medina, Vice President, the directors of the Secretary General of Electoral Voters respectively, in order to proceed with the delivery to the technical commissions, designated at the meeting dated 13 February 2004, they opened the tender envelopes containing the tenders of the companies that wanted to be awarded a contract for the automation of Venezuela's voting system and the processes used to carry out the 2004 referendum on the revocation of Hugo Chavez's election. Below you can read the amounts of offers made by Smartmatic SBC, Diebold and other bidders.

13. Then, on page DIAZ 000031, there is an internal note from the Director General of Administration, Mr. Medina. It was dated 14 February 2004 and said that a report on the research and evaluation of companies bidding for the automation of the voting system needed to be prepared.

14. It would then draw attention to the page marked DIAZ 000029. It is a document made on February 13, 2004. While this page is out of sequence, it shows the speed at which the decision was made to award the electoral system contract. The tender began on February 13 and had ended on February 16th -- a three-day period to review contracts and evaluate the specifications and performance of bidders' systems, including software, hardware, security, performance and bidding costs for the procurement, installation, training and operation of the systems. By February 16th, a decision to choose Smartmatic was made. This is convincing evidence that there was no genuine competition for the electoral system contract or serious consideration for alternative contracts. There was no due diligence and the bidding was rigged. It is not possible that within three or four days to do the formal investigation to evaluate the bids and award a contract of this size and important. The impropriety of this action is confirmed by the fact that the contract with Smartmatic was signed a month later, on 15 March 2004.

15. After the contract was awarded to Smartmatic, it was learned that Smartmatic had no previous experience in conducting elections and electoral tabulations. More importantly, it was discovered that the Smartmatic voting system contained two-way communication functions that allowed voting data not only to be sent to a central system of operation and voting, but the central voting system in operation and tabulation to send operational instructions and data to voting machines. It is not mentioned in the contract documents and specifications that the system would be bidirectional and would allow the transmission of data and instructions from the central operating system directly to voting machines. One

simply has to examine the system diagram on page DIAZ 000057 of Exhibit 1. If this feature of the Smartmatic system had been disclosed to the Electoral Council, it could not have adequately accepted Smartmatic's offer because it would allow the Smartmatic voting system to be handled in a way that manipulated votes and interfered with the legitimate voting and electoral process by impersonating the will to govern officials with the will of the electorate: the citizens of Venezuela. It was not surprising that Hugo Chávez and his successors then constantly won the election through the use and manipulation of the Smartmatic voting system.

16. In the 16 years since I left my post as Director General of Political Parties at the National Electoral Council of Venezuela, I have studied the electoral systems of Bolivia, Colombia, Ecuador, Guatemala, Honduras and Nicaragua and have observed elections and participated in pro-democratic forums in Colombia, Ecuador, Honduras and Nicaragua. I have also studied and researched electoral processes in Europe, participating in public academic conferences in Spain and Italy on the subject of democratic electoral processes.

17. Based on my specialized experiences with electoral systems, I have a firm view that no legitimate electronic voting system should be allowed to have the ability of two-way communications to send data and instructions between central tabulation operations and voting machines over telephone lines or the Internet. Having such characteristics compromise the integrity of the entire voting process by allowing injection of data and instructions to manipulate voting before, during and after an election and to avoid detection of processes and mechanisms designed to prevent voting manipulation and fraud.

I declare under penalty of perjury that the above is true and correct and that this Statement was prepared in Dallas County, Texas, and executed on November 20, 2020.

Ana Mercedes Díaz Cardozo

Declaration of Seth Keshel

Pursuant to 28 U.S.C Section 1746, I, Seth Keshel, make the following declaration.

1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. I am a trained data analyst with experience in multiple fields, including service in the United States Army as a Captain of Military Intelligence, with a one-year combat tour in Afghanistan. My experience includes political involvement requiring a knowledge of election trends and voting behavior.
3. I reside at 233 Muir Hill Dr., Aledo, TX 76008.
4. My declaration highlights substantial deviance from statistical norms and results regarding voting patterns in Wisconsin.
5. All 2020-related voting totals are taken from the Decision Desk HQ unofficial tracker, are not certified, and are subject to change from the time of the creation of this declaration.
6. Wisconsin has shown a steady decrease for support in Democratic presidential nominees since Barack Obama won the state by 13.91% in 2008. He won Wisconsin again in 2012, but only by a margin of 6.94%, and Republican Donald Trump won the state by 0.77% in 2016.
7. As part of an overall working-class voter shift, Wisconsin has moved in the same manner as Pennsylvania, Ohio, Michigan, and Minnesota – decreasing levels of support for Democratic nominees, and by consequence of this shift, increasing levels of support for Republican

nominees. This shift is captured in visual form in Exhibit A to this declaration.

8. The following counties have cast more Democratic presidential votes than cast for Obama in 2008, when he won the state by 13.91%:
    a. Ozaukee – 26,515 Biden votes, a 31.5% increase from 2016, and 28.8% more than cast for Obama in 2008. President Trump has increased his vote share by 11.3%, receiving 33,912 votes. Democratic vote shifts were -6.9% in 2012 and +5.3% in 2016.
    b. Dane – 260,157 Biden votes, a 19.5% increase from 2016, and 26.3% more than cast for Obama in 2008. President Trump has increased his vote share by 10.5%, receiving 78,789 votes. Democratic vote shifts were +4.9% in 2012 and +0.8% in 2016. Dane County is home to the University of Wisconsin. President Obama had record support, turnout, and enthusiasm among college-age students and did not have to navigate pandemic-related challenges to turn out these voters, which makes Biden's total extremely suspicious.
    c. Waukesha – 103,867 Biden votes, a 31.1% increase from 2016, and 21.7% more than cast for Obama in 2008. President Trump has increased his vote share by 12.0%, receiving 159,633 votes. Democratic vote shifts were -7.7% in 2012 and +0.6% in 2016.
    d. St. Croix - 23,190 Biden votes, a 32.7% increase from 2016, and 9.5% more than cast for Obama in 2008. President Trump has increased his vote share by 22.8%, receiving 32,190 votes. Democratic vote shifts were -6.0% in 2012 and -12.2% in 2016,

making such a sharp Democratic turnabout in the face of a strong President Trump vote increase extremely suspect.

e. Washington - 26,647 Biden votes, a 27.8% increase from 2016, and 3.6% more than cast for Obama in 2008. President Trump has increased his vote share by 16.4%, receiving 60,235 votes. Democratic vote shifts were -9.9% in 2012 and -10.0% in 2016. A rebound of 27.8% for Democrats from two consecutive cycles of heavy losses, particularly with President Trump reconsolidating the Republican Party base and lost third-party voters, seems unlikely.

f. Bayfield - 6,155 Biden votes, a 24.3% increase from 2016, and 3.1% more than cast for Obama in 2008. President Trump has increased his vote share by 12.0%, receiving 4,617 votes. Democratic vote shifts were +1.0% in 2012 and -18.9% in 2016.

9. Milwaukee County's voter rolls shrank from 2016 to 2020, after losing 13.1% of President Obama's Democratic vote total from 2012; however, this year, Milwaukee County has surged in Democratic votes to nearly equal Obama re-election levels with 317,251 votes, even as President Trump has made an increase of 6.6% in votes. With a declining voter roll, Milwaukee County was likely on track to cast less than 275,000 Democratic ballots this year. Combining these resurgent totals with the transparency issues experienced on the early morning hours of November 4, their current total of 317,251 is strikingly suspect.

10. *New York Times* live vote reporting shows a dump of 168,541 votes at 3:42:20 (a.m.) on November 4, 2020. Of those votes, 143,378

(85.07%) went for Biden, and just 25,163 (14.93%) went for Trump. This dump was enough to flip the race with almost no transparency to the viewing public. The live graph showing this vote dump (circled) is attached as Exhibit D to this document.

11. President Trump has vastly increased his vote share in the entirety of Wisconsin, and also in the rural parts of the state, including the counties he flipped from Democratic to Republican in 2016; however, against the trends of the previous election, the Democrats have increased at greater margins than Trump has, thereby erasing margin gain, and allowing for suspicious vote totals in Milwaukee, Dane, Ozaukee, Waukesha, St. Croix, and other counties with strikingly high Democratic vote totals to overwhelm Trump's totals. A county classification of Wisconsin is available in Exhibit B to this declaration, and a full analysis of Wisconsin's voter irregularities is available in Exhibit C.

Aledo, Texas

Improbable Voting Trend Reversals in Wisconsin

Seth Keshel, MBA

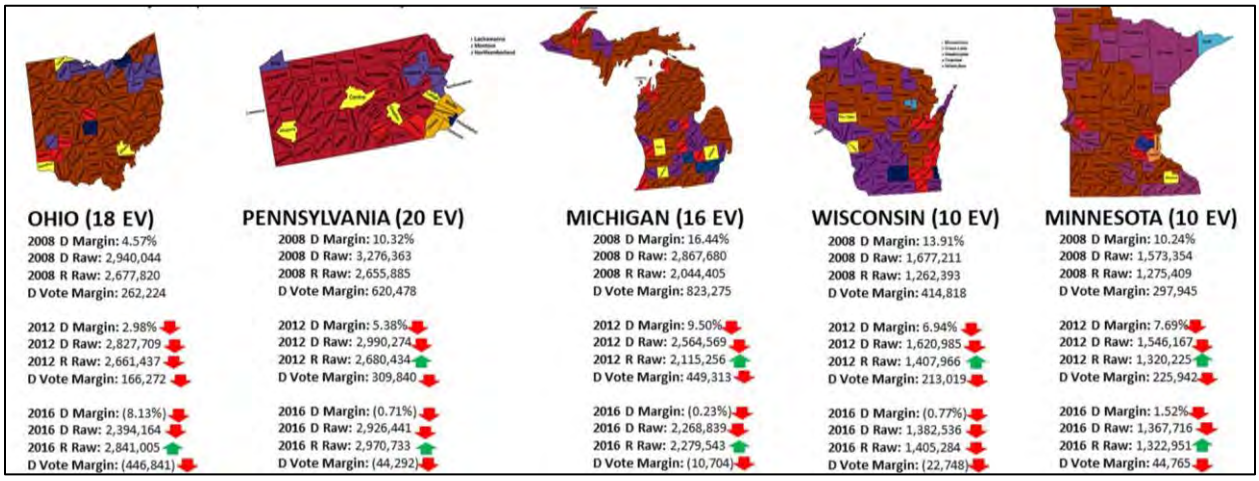
Executive Summary

Wisconsin is showing the same pattern of potential widespread fraud as observed in Pennsylvania, Michigan, Georgia, and North Carolina. While Milwaukee County is focal for transparency and observation violations, including reporting statistically impossible vote counts in the early morning hours away from scrutiny, Dane County has surged far past support totals for President Obama, despite expected difficulties mobilizing student voters to polls. President Trump has reconsolidated the Republican base in suburban Milwaukee and far surpassed his 2016 support levels but has been limited in margin growth by historically improbable Democratic support in these strongholds, which defy years of data in Wisconsin in which the Republican party surged as the Democratic Party plunged. Finally, in strong Trump counties showing a double inversion cycle (one party up, the other down), particularly in rural and exurban Wisconsin, Trump's totals are soaring, and against established trends, Biden's totals are at improbable levels of support despite lacking registration population growth.

The entire vote must be recanvassed and audited for both electronic vote fraud and mail/absentee fraud.

Opening

Since President Obama swept through the Midwest ("Rust Belt") region in 2008, winning Pennsylvania by 10 percent, Michigan by 16 percent, and Wisconsin by 14 percent, the Democratic Party has declined steadily in all successive Presidential elections in not only share of the vote, but in raw votes overall, without exception (pending the final results of the 2020 election). Pennsylvania is the only state mentioned in this paragraph which registers voters by party, and it has trended three percentage points in favor of Republicans since the 2016 election. The raw vote trends and results in these three states, plus Ohio and Minnesota, are pictured below.



These trends show the Democrats losing raw votes in every election since 2008, with the Republicans gaining in eight of 10 samples, and with the margins moving in favor of Republicans each time. This is a product of limited or stagnant population growth in these states, which given stable turnout numbers, means one party is typically going down if another is going up. In fast-growing states such as Florida, Texas, or Arizona, it should be expected for both parties to make substantial gains in a "horse race" scenario.

Wisconsin

President Obama's margin of victory in Wisconsin from 2008 fell from 13.91% to 6.94% in his reelection campaign, and that margin moved 7.71% toward Republicans in 2016 as the working-class communities that historically favored Democrats moved to support then-candidate Donald Trump. Declining voting power from these working class counties beginning and 2012, and then from Milwaukee County in 2016 was an instrumental part of this shift, as was the substantial movement of northern Wisconsin toward the Republican Party. President Trump was able to win Wisconsin in 2016 thanks to substantially decreased support for Democrats, and even overcame less than optimal support from the Republican strongholds of southeastern Wisconsin.

The consistent characteristic in the shift in Wisconsin's political landscape is the declining Democratic Party raw vote totals, and the increasing Republican totals. Thus far, according to the Decision Desk unofficial vote tally, President Trump is substantially adding to his vote totals in every Wisconsin County, while his opponent adds votes at a greater percentage, often in counties that have trended steadily away from Democrats since at least 2008. The following counties, which have mostly lost Democratic votes since 2008, have now contributed more Biden votes than Obama received in 2008, when he won the state by 13.91%. Green font represents growth in raw votes. Red font represents decrease in raw votes.

County	Rep '08	Dem '08	Rep '12	Dem '12	Rep '16	Dem '16	Rep '20	Dem '20	Dem Percentage of Obama 2008 Votes

Findings

The most suspicious counties are those that showed two consecutive elections trending upward for the Republican candidate and downward for the Democratic candidate. These show a similar pattern to counties in Pennsylvania trending heavily Republican in registration, with a significant increase for President Trump in raw votes in 2020, but a smaller than expected margin due to an unexpected sharp reversal of votes for Biden in counties showing inverse trends for parties in recent elections. The only counties not showing two consecutive cycles of decline for Democrats are Waukesha, Bayfield, and Milwaukee. Wisconsin had several Republican counties in 2016 with fewer votes for Trump and higher third-party vote shares (hence 2,682 fewer votes for Trump than Romney), but based on 2020 returns to this point, that has been overcome in every single county.

Dane County is clearly associated with a major university, with student turnout thought to be reaching record lows due to campus shutdowns and lack of mobilization. This county is over 2008 Obama levels by 26.3% (54,173 votes), when that candidate drew record support from young voters, and up 19.5% since 2016, after two consecutive elections of sparse growth in Democrat votes. This county is one of few counties Obama overperformed in for his reelection, and 2020's total is still 20.4% over that number. The same mathematical improbability given the circumstances of 2020 was also seen in Washtenaw County, Michigan (home county of the University of Michigan). Dane County should be audited and recanvassed significantly, particularly for mail and absentee ballot fraud.

Trump slightly underperformed Romney's 2012 vote totals statewide because he lagged in total votes from suburban counties Waukesha, Racine, Washington, Ozaukee, and Walworth. This year, he has reconsolidated the Republican base and improved at a minimum of 11.3% (Ozaukee) in raw votes in these counties, and at a high of 17.3% (Walworth). President Trump has grown his share of raw votes in Wisconsin by a minimum of 4.1% (Menominee) in all counties, and at a high of 24.8% (Kenosha).

Among the largest counties in the state, the largest spikes in growth since 2016 by the Democratic candidate came in St. Croix (32.7%), Ozaukee (31.5%), Waukesha (31.1%), Washington (27.7%), placing them ahead of President Obama's total of votes in those counties in 2008, a year in

which he won the state by 13.91%. This could be feasible if the inverse pattern of "one party up, one party down" were present, suggesting the transfer of voters from one party to the next, but President Trump has also greatly overperformed his 2016 vote totals and does not exhibit the collapse in support seen by Democrats in 2012 and 2016, especially in known Republican strongholds. While it is plausible that Democrats should add votes in those counties based on observed party registration trends in the Philadelphia area, it is unfathomable that those counties would overperform their 2008 Obama vote numbers by such margins, while still adding substantial increases in raw votes to President Trump in 2020.

Despite ranking 67th in the state in percentage increase in voter registrations, Milwaukee County increased its share of Democratic votes by 9.8%, even as President Trump increased by 6.6% while supposedly securing a higher share of minority votes than any Republican since 1960. Biden's total is nearly equal to Obama's 2008 performance and reverses a massive loss of Democratic votes in 2016 in a post-Obama environment, despite a decreasing voter roll (more than 3% decrease in registrations since 2016). Strangely, Milwaukee's turnout dwarfs other regional counterparts like Cleveland, Gary, and Indianapolis. This county is reported to have had many flagrant abuses of transparency regulations and is also known to have reported results without observation in the early morning hours of November 4, 2020, which was just enough to overcome a once formidable lead in the state by President Trump. The best course of action in Milwaukee is to recanvass and audit every mail-in and absentee ballot for massive fraud. The trend in Cleveland, Detroit, Milwaukee, and Philadelphia recently has suggested decreasing vote totals from one election to the next and is supported by the aforementioned significant decrease in the voter rolls in Milwaukee. This year's reported vote totals necessitate and improbable turnout level and suggest illegality in reporting and mail balloting.

All counties showing two consecutive cycles of inverse party trend (Republican up twice, Democrat down twice), with Democrats substantially up this year, may be subject to counting errors, or "glitches," like those reported in Antrim County, Michigan, or even recently in Rock County, Wisconsin. These voting machines and their associated software should be audited and examined by coding professionals, especially if the recent newsworthy events regarding corrupted voting software are widespread. It is highly possible that tampered or corrupted software in known Trump strongholds may be responsible for reducing margins of raw vote victory in counties that have massively left the Democratic Party since 2008.

The entire vote in Wisconsin is suspect against recent trends and should be subject to recanvass and audit, not just a recount of hundreds of thousands of illegal ballots. It appears that the major case in the state is that in spite of substantially growing his vote share in strong-Trump counties, and surging in votes in urban and suburban counties, Trump's margin is substantially limited, even after two consecutive inverse party trends. In urban or suburban areas, Democratic vote share is soaring to record numbers, even over Obama's totals after a 13.91% win, all while Trump surges in votes in those counties as well. Urban areas have issues with transparency and should be fully audited for mail and absentee fraud.

Ballot-Marking Devices (BMDs) Cannot Assure the Will of the Voters

Abstract

The complexity of U.S. elections usually requires computers to count ballots—but computers can be hacked, so election integrity requires a voting system in which paper ballots can be recounted by hand. However, paper ballots provide no assurance unless they accurately record the vote as the voter expresses it.

Voters can express their intent by indelibly hand-marking ballots, or using computers called ballot-marking device (BMDs). Voters can make mistakes in expressing their intent in either technology, but only BMDs are also subject to hacking, bugs, and misconfiguration of the software that prints the marked ballots. Most voters do not review BMD-printed ballots, and those who do often fail to notice when the printed vote is not what they expressed on the touchscreen. Furthermore, there is no action a voter can take to demonstrate to election officials that a BMD altered their expressed votes, nor is there a corrective action that election officials can take if notified by voters—there is no way to deter, contain, or correct computer hacking in BMDs. These are the essential security flaws of BMDs.

Risk-limiting audits can assure that the votes recorded on paper ballots are tabulated correctly, but no audit can assure that the votes on paper are the ones expressed by the voter on a touchscreen: Elections conducted on current BMDs cannot be confirmed by audits. We identify two properties of voting systems, *contestability* and *defensibility*, necessary for audits to confirm election outcomes. No available EAC-certified BMD is contestable or defensible.

1 Introduction: Criteria for Voting Systems

Elections for public office and on public questions in the United States or any democracy must produce outcomes based on the votes that voters *express* when they indicate their choices on a paper ballot or on a machine. Computers have become indispensable to conducting elections, but computers are vulnerable. They can be hacked—compromised by insiders or external adversaries who can replace their software with fraudulent software that deliberately miscounts votes—and they can contain design errors and bugs—hardware or software flaws or configuration errors that result in mis-recording or mis-tabulating votes. Hence there must be some way, *independent* of any software in any computers, to ensure that reported election outcomes are correct, i.e., consistent with the expressed votes as intended by the voters.

Voting systems should be *software independent*, meaning that "an undetected change or error in its software cannot cause an undetectable change or error in an election outcome" [29, 30, 31]. Software independence is similar to tamper-evident packaging: if somebody opens the container and disturbs the contents, it will leave a trace.

The use of software-independent voting systems is supposed to ensure that if someone fraudulently hacks the voting machines to steal votes, we'll know about it. But we also want to know *the true outcome* in order to avoid a do-over election.[1] A voting system is *strongly software independent* if it is software independent and, moreover, a detected change or error in an election outcome (due to change or error in the software) can be corrected using only the ballots and ballot records of the current election [29, 30]. Strong software independence combines tamper evidence with a kind of resilience: there's a way to tell whether faulty software caused a problem, and a way to recover from the problem if it did.

Software independence and *strong software independence* are now standard terms in the analysis of voting systems, and it is widely accepted that voting systems should be software independent. Indeed, version 2.0 of the Voluntary Voting System Guidelines (VVSG 2.0) incorporates this principle [10].

But as we will show, these standard definitions are incomplete and inadequate, because in the word *undetectable* they hide several important questions: *Who* detects the change or error in an election outcome? How can a person *prove* that she has detected

[1] Do-overs are expensive; they may delay the inauguration of an elected official; there is no assurance that the same voters will vote in the do-over election as voted in the original; they decrease public trust. And if the do-over election is conducted with the same voting system that can only detect but not correct errors, then there may need to be a do-over of the do-over, *ad infinitum.*

an error? *What happens* when someone detects an error—does the election outcome remain erroneous? Or conversely: How can an election administrator *prove* that the election outcome not been altered, or prove that the correct outcome was recovered if a software malfunction was detected? The standard definition does not distinguish evidence available to an election official, to the public, or just to a single voter; nor does it consider the possibility of false alarms.

Those questions are not merely academic, as we show with an analysis of ballot-marking devices. Even if some *voters* "detect" that the printed output is not what they expressed to the BMD—even if some of *those* voters report their detection to election officials—there is no mechanism by which the *election official* can "detect" whether a BMD has been hacked to alter election outcomes. The questions of *who detects, and then what happens,* are critical—but unanswered by the standard definitions.

We will define the terms *contestable* and *defensible* to better characterize properties of voting systems that make them acceptable for use in public elections.[2]

A voting system is *contestable* if an undetected change or error in its software that causes a change or error in an election outcome can always produce *public* evidence that the outcome is untrustworthy. For instance, if a voter selected candidate A on the touchscreen of a BMD, but the BMD prints candidate B on the paper ballot, then this A-vs-B evidence is available to the individual voter, but the voter cannot demonstrate this evidence to anyone else, since nobody else saw—nor should have seen—where the voter touched the screen.[3] Thus, the voting system does not provide a way for the voter who observed the misbehavior to prove to anyone else that there was a problem, even if the problems altered the reported outcome. Such a system is therefore not *contestable*.

While the definition of software independence might allow evidence available only to individual voters as "detection," such evidence does not suffice for a system to be contestable. Contestibility is software independence, plus the requirement that "detect" implies "can generate public evidence." "Trust me" does not count as public evidence. If a voting system is not contestable, then problems voters "detect" might never see the light of day, much less be addressed or corrected.[4]

[2]There are other notions connected to contestability and defensibility, although essentially different: Benaloh et al. [6] define a *P-resilient canvass framework*, *personally verifiable P-resilient canvass framework*, and *privacy-perserving personally verifiable P-resilient canvass frameworks*.

[3]See footnote 18.

[4]If voters are the only means of detecting and quantifying the effect of those problems—as they are for BMDs—then in practice the system is not strongly software independent. The reason is that, as we will show, such claims by (some) voters *cannot* correct software-dependent changes to other voters' ballots, and *cannot* be used as the basis to invalidate or correct an election outcome. Thus, BMD-based

Similarly, while strong software independence demands that a system be able to report the correct outcome even if there was an error or alteration of the software, it does not require *public evidence* that the (reconstructed) reported outcome is correct. We believe, therefore, that voting systems must also be *defensible*. We say that a voting system is defensible if, when the reported electoral outcome is correct, it is possible to generate convincing public evidence that the reported electoral outcome is correct—despite any malfunctions, software errors, or software alterations that might have occurred. If a voting system is not defensible, then it is vulnerable to "crying wolf": malicious actors could claim that the system malfunctioned when in fact it did not, and election officials will have no way to prove otherwise.

By analogy with *strong software independence*, we define: A voting system is *strongly defensible* if it is defensible and, moreover, a detected change or error in an election outcome (due to change or error in the software) can be corrected (with convincing public evidence) using only the ballots and ballot records of the current election.

In short, a system is contestable if it can generate public evidence of a problem whenever a reported outcome is wrong, while a system is defensible if it can generate public evidence whenever a reported outcome is correct—despite any problems that might have occurred. Contestable systems are publicly tamper-evident; defensible systems are publicly, demonstrably resilient.

Defensibility is a key requirement for *evidence-based elections* [38]: defensibility makes it possible in principle for election officials to generate convincing evidence that the reported winners really won—if the reported winners did really win. (We say an election *system* may be defensible, and an *election* may be evidence-based; there's much more *process* to an election than just the choice of system.)

Examples. The only known practical technology for contestable, strongly defensible voting is a system of *hand-marked paper ballots*, kept demonstrably physically secure, counted by machine, audited manually, and recountable by hand.[5] In a hand-marked paper ballot election, ballot-marking software cannot be the source of an error or change-of-election-outcome, because no software is used in marking ballots. Ballot-scanning-and-counting software can be the source of errors, but such errors can be

election systems are not even (weakly) software independent, unless one takes "detection" to mean "somebody claimed there was a problem, with no evidence to support that claim."

[5]The election must also generate convincing evidence that physical security of the ballots was not compromised, and the audit must generate convincing public evidence that the audit itself was conducted correctly.

detected and corrected by audits.

That system is *contestable:* if an optical scan voting machine reports the wrong outcome because it miscounted (because it was hacked, misprogrammed, or miscalibrated), the evidence is *public*: the paper ballots, recounted before witnesses, will not match the claimed results, also witnessed. It is *strongly defensible:* a recount before witnesses can demonstrate that the reported outcome is correct, or can find the correct outcome if it was wrong—and provide public evidence that the (reconstructed) outcome is correct.

Some other paper-based systems such as Prêt-à-Voter [32] and Scantegrity [9] are also contestable and strongly defensible (provided the marked ballots are kept demonstrably secure through tabulation and posting). Scantegrity inherits these properties from the fact that it amounts to a cryptographic enhancement of hand-marked paper ballots. Prêt-à-Voter has these properties if the blank ballots are audited appropriately before the election.

Paper-based systems that rely on the "Benaloh challenge"—to ensure that the encryption of the vote printed on the ballot (by an electronic device) is correct—generally are neither contestable nor defensible.[6] The reason is that, while the challenge can produce public evidence that a machine did not accurately encrypt the plaintext vote on the ballot, if the machine prints the wrong plaintext vote and a correct encryption of that incorrect vote, there is no evidence the voter can use to prove that to anyone else. STAR-Vote [5] is an example of such a system.

Over 40 states now use some form of paper ballot for most voters [18]. Most of the remaining states are taking steps to adopt paper ballots. But *not all voting systems that use paper ballots are equally secure*.

Some are not even software independent. Some are software independent, but not strongly software independent, contestable, or defensible. In this report we explain:

- *Hand-marked paper ballot* systems are the only practical technology for contestable, strongly defensible voting systems.
- *Some ballot-marking devices (BMDs)* can be software independent, but they not strongly software independent, contestable, or defensible. Hacked or misprogrammed BMDs can alter election outcomes undetectably, so elections conducted using BMDs cannot provide public evidence that reported outcomes are correct. If BMD malfunctions are detected, there is no way to determine who

[6] Nor are they strongly software independent.

really won. Therefore BMDs should not be used by voters who are able to mark an optical-scan ballot with a pen.

- *All-in-one BMD or DRE+VVPAT voting machines* are not software independent, contestable, or defensible. They should not be used in public elections.

2 Background

We briefly review the kinds of election equipment in use, their vulnerability to computer hacking (or programming error), and in what circumstances risk-limiting audits can mitigate that vulnerability.

Voting equipment

Although a voter may form an intention to vote for a candidate or issue days, minutes, or seconds before actually casting a ballot, that intention is a psychological state that cannot be directly observed by anyone else. Others can have access to that intention through what the voter (privately) *expresses* to the voting technology by interacting with it, e.g., by making selections on a BMD or marking a ballot by hand.[7] Voting systems must accurately record the vote as the voter *expressed* it.

With a *hand-marked paper ballot optical-scan* system, the voter is given a paper ballot on which all choices (candidates) in each contest are listed; next to each candidate is a *target* (typically an oval or other shape) which the voter marks with a pen to indicate a vote. Ballots may be either preprinted or printed (unvoted) at the polling place using *ballot on demand* printers. In either case, the voter creates a tamper-evident record of intent by marking the printed paper ballot with a pen.

Such hand-marked paper ballots may be scanned and tabulated at the polling place using a *precinct-count optical scanner* (PCOS), or may be brought to a central place to

[7] We recognize that voters make mistakes in expressing their intentions. For example, they may misunderstand the layout of a ballot or express an unintended choice through a perceptual error, inattention, or lapse of memory. The use of touchscreen technology does not necessarily correct for such user errors, as every smartphone user who has mistyped an important text message knows. Poorly designed ballots, poorly designed touchscreen interfaces, and poorly designed assistive interfaces increase the rate of error in voters' expressions of their votes. For the purposes of this report, we assume that properly engineered systems seek to minimize such usability errors.

be scanned and tabulated by a *central-count optical scanner* (CCOS). Mail-in ballots are typically counted by CCOS machines.

After scanning a ballot, a PCOS machine deposits the ballot in a secure, sealed ballot box for later use in recounts or audits; this is *ballot retention*. Ballots counted by CCOS are also retained for recounts or audits.[8]

Paper ballots can also be hand counted, but in most jurisdictions (especially where there are many contests on the ballot) this is hard to do quickly; Americans expect election-night reporting of unofficial totals. Hand counting—i.e., manually determining votes directly from the paper ballots—is appropriate for audits and recounts.

A *ballot-marking device* (BMD) provides a computerized user interface that presents the ballot to voters and captures their expressed selections—for instance, a touchscreen interface or an assistive interface that enables voters with disabilities to vote independently. Voter inputs (expressed votes) are recorded electronically. When a voter indicates that the ballot is complete and ready to be cast, the BMD prints a paper version of the electronically marked ballot. We use the term *BMD* for devices that mark ballots but do not tabulate or retain them, and *all-in-one* for devices that combine ballot marking, tabulation, and retention into the same paper path.

The paper ballot printed by a BMD may be in the same format as an optical-scan form (e.g., with ovals filled as if by hand) or it may list just the names of the candidate(s) selected in each contest. The BMD may also encode these selections into barcodes or QR codes for optical scanning. We discuss issues with barcodes later in this report.

An *all-in-one touchscreen voting machine* combines computerized ballot marking, tabulation, and retention in the same paper path. All-in-one machines come in several configurations:

- DRE+VVPAT machines—direct-recording electronic (DRE) voting machines with a voter-verifiable paper audit trail (VVPAT)—provide the voter a touchscreen (or other) interface, then print a paper ballot that is displayed to the voter under glass. The voter is expected to review this ballot and approve it, after which the machine deposits it into a ballot box. DRE+VVPAT machines do not contain optical scanners; that is, they do not read what is marked on the paper ballot; instead, they tabulate the vote directly from inputs to the touchscreen or other interface.

[8] Regulations and procedures governing custody and physical security of ballots are uneven and in many cases inadequate, but straightforward to correct because of decades of development of best practices.

- BMD+Scanner all-in-one machines[9] provide the voter a touchscreen (or other) interface to input ballot choices and print a paper ballot that is ejected from a slot for the voter to inspect. The voter then reinserts the ballot into the slot, after which the all-in-one BMD+scanner scans it and deposits it into a ballot box. Or, some BMD+Scanner all-in-one machines display the paper ballot behind plexiglass for the voter to inspect, before mechanically depositing it into a ballot box.

Opscan+BMD with separate paper paths. At least one model of voting machine (the Dominion ICP320) contains an optical scanner (opscan) and a BMD in the same cabinet,[10] so that the optical scanner and BMD-printer are not in the same paper path; no possible configuration of the software could cause a BMD-marked ballot to be deposited in the ballot box without human handling of the ballot. We do not classify this as an *all-in-one* machine.

Hacking

There are many forms of computer hacking. In this analysis of voting machines we focus on the alteration of voting machine software so that it miscounts votes or mismarks ballots to alter election outcomes. There are many ways to alter the software of a voting machine: a person with physical access to the computer can open it and directly access the memory; one can plug in a special USB thumbdrive that exploits bugs and vulnerabilities in the computer's USB drivers; one can connect to its WiFi port or Bluetooth port or telephone modem (if any) and exploit bugs in those drivers, or in the operating system.

"Air-gapping" a system (i.e., never connecting it to the Internet nor to any other network) does not automatically protect it. Before each election, election administrators must transfer a *ballot definition* into the voting machine by inserting a *ballot definition cartridge* that was programmed on election-administration computers that may have been connected previously to various networks; it has been demonstrated that vote-changing viruses can propagate via these ballot-definition cartridges [17].

Hackers might be corrupt insiders with access to a voting-machine warehouse; corrupt insiders with access to a county's election-administration computers; outsiders who can gain remote access to election-administration computers; outsiders who can

[9] Some voting machines, such as the ES&S ExpressVote, can be configured as either a BMD or a BMD+Scanner all-in-one. Others, such as the ExpressVoteXL, work only as all-in-one machines.

[10] More precisely, the ICP320 optical scanner and the BMD audio+buttons interface are in the same cabinet, but the printer is a separate box.

gain remote access to voting-machine manufacturers' computers (and "hack" the firmware installed in new machines, or the firmware updates supplied for existing machines), and so on. Supply-chain hacks are also possible: the hardware installed by a voting system vendor may have malware pre-installed by the vendor's component suppliers.[11]

Computer systems (including voting machines) have so many layers of software that it is impossible to make them perfectly secure [23, pp. 89–91]. When manufacturers of voting machines use the best known security practices, adversaries may find it more difficult to hack a BMD or optical scanner—but not impossible. Every computer in every critical system is vulnerable to compromise through hacking, insider attacks or exploiting design flaws.

Election assurance through risk-limiting audits

To ensure that the reported electoral outcome of each contest corresponds to what the voters expressed, the most practical known technology is a *risk-limiting audit* (RLA) of trustworthy paper ballots [34, 35, 22]. The National Academies of Science, Engineering, and Medicine, recommend routine RLAs after every election [23], as do many other organizations and entities concerned with election integrity.[12]

The *risk limit* of a risk-limiting audit is the maximum chance that the audit will not correct the reported electoral outcome, if the reported outcome is wrong. "Electoral outcome" means the political result—who or what won—not the exact tally. "Wrong" means that the outcome does not correspond to what the voters expressed.

A RLA involves manually inspecting randomly selected paper ballots following a rigorous protocol. The audit stops if and when the sample provides convincing evidence that the reported outcome is correct; otherwise, the audit continues until every ballot has been inspected manually, which reveals the correct electoral outcome if the paper trail is trustworthy. RLAs protect against vote-tabulation errors, whether those errors are caused by failures to follow procedures, misconfiguration, miscalibration, faulty

[11] Given that many chips and other components are manufactured in China and elsewhere, this is a serious concern. Carsten Schürmann has found Chinese pop songs on the internal memory of voting machines (C. Schürmann, personal communication, 2018). Presumably those files were left there accidentally—but this shows that malicious code *could* have been pre-installed deliberately, and that neither the vendor's nor the election official's security and quality control measures discovered and removed the extraneous files.

[12] Among them are the Presidential Commission on Election Administration, the American Statistical Association, the League of Women Voters, and Verified Voting Foundation.

engineering, bugs, or malicious hacking.[13]

The risk limit should be determined as a matter of policy or law. For instance, a 5% risk limit means that, if a reported outcome is wrong solely because of tabulation errors, there is at least a 95% chance that the audit procedure will correct it. Smaller risk limits give higher confidence in election outcomes, but require inspecting more ballots, other things being equal. RLAs never revise a correct outcome.

RLAs can be very efficient, depending in part on how the voting system is designed and how jurisdictions organize their ballots. If the computer results are accurate, an efficient RLA with a risk limit of 5% requires examining just a few—about 7 divided by the margin—ballots selected randomly from the contest.[14] For instance, if the margin of victory is 10% and the results are correct, the RLA would need to examine about $7/10\% = 70$ ballots to confirm the outcome at 5% risk. For a 1% margin, the RLA would need to examine about $7/1\% = 700$ ballots. The sample size does not depend much on the total number of ballots cast in the contest, only on the margin of the winning candidate's victory.

RLAs assume that a full hand tally of the paper trail would reveal the correct electoral outcomes: the paper trail must be trustworthy. Other kinds of audits, such as *compliance audits* [6, 22, 38, 36] are required to establish whether the paper trail itself is trustworthy. Applying an RLA procedure to an untrustworthy paper trail cannot limit the risk that a wrong reported outcome goes uncorrected.

Properly preserved hand-marked paper ballots ensure that expressed votes are identical to recorded votes. But BMDs might not record expressed votes accurately, for instance, if BMD software has bugs, was misconfigured, or was hacked: BMD printout is not a trustworthy record of the expressed votes. Neither a compliance audit nor a RLA can possibly check whether errors in recording expressed votes altered election outcomes. RLAs that rely on BMD output therefore cannot limit the risk that an incorrect reported election outcome will go uncorrected.

A paper-based voting system (such as one that uses optical scanners) is systematically more secure than a paperless system (such as DREs) *only if the paper trail is trustworthy and the results are checked against the paper trail using a rigorous method such as an RLA or full manual tally*. If it is possible that error, hacking, bugs, or mis-

[13] RLAs do not protect against problems that cause BMDs to print something other than what was shown to the voter on the screen, nor do they protect against problems with ballot custody.

[14] Technically, it is the *diluted margin* that enters the calculation. The diluted margin is the number of votes that separate the winner with the fewest votes from the loser with the most votes, divided by the number of ballots cast, including undervotes and invalid votes.

calibration caused the recorded-on-paper votes to differ from the expressed votes, an RLA or even a full hand recount cannot not provide convincing public evidence that election outcomes are correct: such a system cannot be *defensible*. In short, paper ballots provide little assurance against hacking if they are never examined or if the paper might not accurately reflect the votes expressed by the voters.

3 (Non)Contestability/Defensibility of BMDs

A BMD-generated paper trail is not a reliable record of the vote expressed by the voter. Like any computer, a BMD (or a DRE+VVPAT) is vulnerable to bugs, misconfiguration, hacking, installation of unauthorized (fraudulent) software, and alteration of installed software.

If a hacker sought to steal an election by altering BMD software, what would the hacker program the BMD to do? In cybersecurity practice, we call this the *threat model*.

The simplest threat model is this one: In some contests, not necessarily top-of-the-ticket, change a small percentage of the votes (such as 5%).

In recent national elections, analysts have considered a candidate who received 60% of the vote to have won by a landslide. Many contests are decided by less than a 10% margin. Changing 5% of the votes can change the margin by 10%, because "flipping" a vote for one candidate into a vote for a different candidate changes the difference in their tallies—i.e., the margin—by 2 votes. If hacking or bugs or misconfiguration could change 5% of the votes, that would be a very significant threat.

Although public and media interest often focus on top-of-the-ticket races such as President and Governor, elections for lower offices such as state representatives, who control legislative agendas and redistricting, and county officials, who manage elections and assess taxes, are just as important in our democracy. Altering the outcome of smaller contests requires altering fewer votes, so fewer voters are in a position to notice that their ballots were misprinted. And most voters are not as familiar with the names of the candidates for those offices, so they might be unlikely to notice if their ballots were misprinted, even if they checked.

Research in a real polling place in Tennessee during the 2018 election, found that half the voters *didn't look at all* at the paper ballot printed by a BMD, even when they were holding it in their hand and directed to do so while carrying it from the BMD to the optical scanner [13]. Those voters who did look at the BMD-printed ballot

spent *an average of 4 seconds* examining it to verify that the eighteen or more choices they made were correctly recorded. That amounts to 222 milliseconds per contest, barely enough time for the human eye to move and refocus under perfect conditions and not nearly enough time for perception, comprehension, and recall [27]. A study by other researchers [7], in a simulated polling place using real BMDs deliberately hacked to alter one vote on each paper ballot, found that only 6.6% of voters told a pollworker something was wrong.[15][16] The same study found that among voters who examined their hand-marked ballots, half were unable to recall key features of ballots cast moments before, a prerequisite step for being able to recall their own ballot choices. This finding is broadly consistent with studies of effects like "change blindness" or "choice blindness," in which human subjects fail to notice changes made to choices made only seconds before [19].

Suppose, then, that 10% of voters examine their paper ballots carefully enough to even *see* the candidate's name recorded as their vote for legislator or county commissioner. Of those, perhaps only half will remember the name of the candidate they intended to vote for.[17]

Of those who notice that the vote printed is not the candidate they intended to vote for, what will they think, and what will they do? Will they think, "Oh, I must have made a mistake on the touchscreen," or will they think, "Hey, the machine is cheating or malfunctioning!" There's no way for the voter to know for sure—voters do make mistakes—and there's *absolutely* no way for the voter to prove to a pollworker or election official that a BMD printed something other than what the voter entered on the

[15] You might think, "the voter really *should* carefully review their BMD-printed ballot." But because the scientific evidence shows that voters *do not* [13] and cognitively *cannot* [16] perform this task well, legislators and election administrators should provide a voting system that counts the votes *as voters express them*.

[16] Studies of voter confidence about their ability to verify their ballots are not relevant: in typical situations, subjective confidence and objective accuracy are at best weakly correlated. The relationship between confidence and accuracy has been studied in contexts ranging from eyewitness accuracy [8, 12, 40] to confidence in psychological clinical assessments [14] and social predictions [15]. The disconnect is particularly severe at high confidence. Indeed, this is known as "the overconfidence effect." For a lay discussion, see *Thinking, Fast and Slow* by Nobel economist Daniel Kahnemann [20].

[17] We ask the reader, "do you know the name of the most recent losing candidate for county commissioner?" We recognize that some readers of this document *are* county commissioners, so we ask those readers to imagine the frame of mind of their constituents.

screen.[18][19]

Either way, polling-place procedures generally advise voters to ask a pollworker for a new ballot if theirs does not show what they intended. Pollworkers should void that BMD-printed ballot, and the voter should get another chance to mark a ballot. Anecdotal evidence suggests that many voters are too timid to ask, or don't know that they have the right to ask, or are not sure whom to ask. Even if a voter asks for a new ballot, training for pollworkers is uneven, and we are aware of no formal procedure for resolving disputes if a request for a new ballot is refused. Moreover, there is no sensible protocol for ensuring that BMDs that misbehave are investigated—nor can there be, as we argue below.

Let's summarize. If a machine alters votes on 5% of the ballots (enabling it to change the margin by 10%), and 10% of voters check their ballots carefully and 50% of the voters who check notice the error, then optimistically we might expect $5\% \times 10\% \times 50\%$ or 0.25% of the voters to request a new ballot and correct their vote.[20] This means that the machine will change the margin by 9.75% and get away with it.

In this scenario, 0.25% of the voters, one in every 400 voters, has requested a new ballot. You might think, "that's a form of *detection* of the hacking." But is isn't, as a practical matter: a few individual voters may have detected that there was a problem, but there's no procedure by which this translates into any action that election administrators can take to correct the outcome of the election. Polling-place procedures *cannot correct or deter hacking, or even reliably detect it*, as we discuss next. This is essentially the distinction between a system that is merely software independent and one that is contestable: a change to the software that alters the outcome might generate evidence for an alert, conscientious, individual voter, but it does not generate public evidence that an election official can rely on to conclude there is a problem.

Even if some voters notice that BMDs are altering votes, there's no way to correct the election outcome. That is, BMD voting systems are *not contestable*, *not defen-*

[18] You might think, "the voter can prove it by showing someone that the vote on the paper doesn't match the vote onscreen." But that won't work. On a typical BMD, by the time a paper record is printed and ejected for the voter to hold and examine, the touchscreen no longer shows the voter's choice. You might think, "BMDs should be designed so that the choices still show on the screen for the voter to compare with the paper." But a hacked BMD could easily alter the on-screen choices to match the paper, *after* the voter hits the "print" button.

[19] Voters should *certainly not* videorecord themselves voting! That would defeat the privacy of the secret ballot and is illegal in most jurisdictions.

[20] This calculation assumes that the 10% of voters who check are in effect a random sample of voters: voters' propensity to check BMD printout is not associated with their political preferences.

sible (and therefore *not strongly defensible*), and *not strongly software independent*. Suppose a state election official wanted to detect whether the BMDs are cheating, and correct election results, based on actions by those few alert voters who notice the error. What procedures could possibly work against the manipulation we are considering?

1. How about, "If at least 1 in 400 voters claims that the machine misrepresented their vote, void the entire election."[21] No responsible authority would implement such a procedure. A few dishonest voters could collaborate to invalidate entire elections simply by falsely claiming that BMDs changed their votes.
2. How about, "If at least 1 in 400 voters claims that the machine misrepresented their vote, then investigate." Investigations are fine, but then what? The only way an investigation can ensure that the outcome accurately reflects what voters expressed to the BMDs is to void an election in which the BMDs have altered votes and conduct a new election. But how do you know whether the BMDs have altered votes, except based the claims of the voters?[22] Furthermore, the investigation itself would suffer from the same problem as above: how can one distinguish between voters who detected BMD hacking or bugs from voters who just want to interfere with an election?

This is the essential security flaw of BMDs: few voters will notice and promptly report discrepancies between what they saw on the screen and what is on the BMD printout, and even when they do notice, there's nothing appropriate that can be done. Even if election officials are convinced that BMDs malfunctioned, *there is no way to determine who really won*.

Therefore, BMDs should not be used by most voters.

Why can't we rely on pre-election and post-election logic and accuracy testing, or parallel testing? Most, if not all, jurisdictions perform some kind of *logic and accuracy testing* (LAT) of voting equipment before elections. LAT generally involves voting on the equipment using various combinations of selections, then checking whether the

[21] Note that in many jurisdictions, far fewer than 400 voters use a given machine on election day: BMDs are typically expected to serve fewer than 300 voters per day. (The vendor ES&S recommended 27,000 BMDs to serve Georgia's 7 million voters, amounting to 260 voters per BMD [33].) Recall also that the rate 1 in 400 is tied to the amount of manipulation. What if the malware flipped only one vote in 50, instead of 1 vote in 20? That could still change the margin by 4%, but—in this hypothetical—would be noticed by only one voter in 1,000, rather than one in 400. The smaller the margin, the less manipulation it would have taken to alter the electoral outcome.

[22] Forensic examination of the BMD might show that it *was* hacked or misconfigured, but it cannot prove that the BMD *was not* hacked or misconfigured.

equipment tabulated the votes correctly. As the Volkswagen/Audi "Dieselgate" scandal shows, devices can be programmed to behave properly when they are tested but misbehave in use [11]. Therefore, LAT can never prove that voting machines performed properly in practice.

Parallel or "live" testing involves pollworkers or election officials using some BMDs at random times on election day to mark (but not cast) ballots with test patterns, then check whether the marks match the patterns. The idea is that the testing is not subject to the "Dieselgate" problem, because the machines cannot "know" they are being tested on election day.[23] As a practical matter, the number of tests required to provide a reasonable chance of detecting outcome-changing errors is prohibitive: it would leave no time for actual voting [37]. Moreover, it would require additional staff, infrastructure, and other resources.

Suppose, counterfactually, that it was practical to perform enough parallel testing to guarantee a large chance of detecting a problem if BMD hacking or malfunction altered electoral outcomes. Suppose, counterfactually, that election officials were required to conduct that amount of parallel testing during every election, and that the required equipment, staffing, infrastructure, and other resources were provided. Even then, the system would not be *strongly defensible*; that is, if testing detected a problem, there would be no way to to determine who really won. The only remedy would be a new election.

Don't voters need to check hand-marked ballots, too? It is always a good idea to check one's work, but there is a substantial body of research (e.g., [28]) suggesting that preventing error as a ballot is being marked is a fundamentally different cognitive task than detecting an error on a previously marked ballot. In cognitively similar tasks, such as proof reading for non-spelling errors, ten percent rates of error detection are common [28, pp 167ff], whereas by carefully attending to the task of correctly marking their ballots, voters apparently can largely avoid marking errors.

A fundamental difference between hand-marked paper ballots and ballot-marking devices is that, with hand-marked paper ballots, voters are responsible for catching and

[23] BMDs do "know" their own settings and other aspects of each voting session, so malware can use that information to target sessions that use the audio interface, increase the font size, use the sip-and-puff interface, set the language to something other than English, or take much longer than average to vote. (Voters who use those settings might be less likely to be believed if they report that the equipment altered their votes.) For parallel testing to have a good chance of detecting all outcome-changing problems, the tests must have a large chance of probing *every* combination of settings and voting patterns that includes enough ballots to change any contest result. It is not practical.

correcting *their own errors*, while if BMDs are used, voters are also responsible for catching *machine errors, bugs, and hacking*. Voters are the *only* people who can detect such problems with BMDs—but, as explained above, if voters do find problems, there's no way they can prove to poll workers or election officials that there were problems and no way to ensure that election officials take appropriate remedial action.

4 Other tradeoffs, BMDs versus hand-marked opscan

Supporters of ballot-marking devices advance several other arguments for their use.

- **Mark legibility.** A common argument is that a properly functioning BMD will generate clean, error-free, unambiguous marks, while hand-marked paper ballots may contain mistakes and stray marks that make it impossible to discern a voter's intent. However appealing this argument seems at first blush, the data are not nearly so compelling. Experience with statewide recounts in Minnesota and elsewhere suggest that truly ambiguous handmade marks are very rare.[24] For instance, 2.9 million hand-marked ballots were cast in the 2008 Minnesota race between Al Franken and Norm Coleman for the U.S. Senate. In a manual recount, between 99.95% and 99.99% of ballots were unambiguously marked.[25] [26] In addition, usability studies of hand-marked bubble ballots—the kind in most common use in U.S. elections—indicate a *voter* error rate of 0.6%, much lower than the 2.5–3.7% error rate for machine-marked ballots [16].[27] Moreover, modern image-based opscan equipment (*digital scan* machinery) is better than older

[24] States do need clear and complete regulations for interpreting voter marks.

[25] "During the recount, the Coleman and Franken campaigns initially challenged a total of 6,655 ballot-interpretation decisions made by the human recounters. The State Canvassing Board asked the campaigns to voluntarily withdraw all but their most serious challenges, and in the end approximately 1,325 challenges remained. That is, approximately 5 ballots in 10,000 were ambiguous enough that one side or the other felt like arguing about it. The State Canvassing Board, in the end, classified all but 248 of these ballots as votes for one candidate or another. That is, approximately 1 ballot in 10,000 was ambiguous enough that the bipartisan recount board could not determine an intent to vote." [1] See also [25]

[26] We have found that some local election officials consider marks to be ambiguous if *machines* cannot read the marks. That is a different issue from *humans* being unable to interpret the marks. Errors in machine interpretation of voter intent can be dealt with by manual audits: if the reported outcome is wrong because machines misinterpreted handmade marks, a RLA has a known, large chance of correcting the outcome.

[27] Better designed user interfaces (UI) might reduce the error rate for machine-marked ballots below the historical rate for DREs; however, UI improvements cannot keep BMDs from printing something other than what the voter is shown on the screen.

"marksense" machines at interpreting imperfect marks. Thus, mark legibility is not a good reason to adopt BMDs for all voters.

- **Undervotes, overvotes.** Another argument offered for BMDs is that the machines can alert voters to undervotes and prevent overvotes. That is true, but modern PCOS systems can also alert a voter to overvotes and undervotes, allowing a voter to eject the ballot and correct it.
- **Bad ballot design.** Ill-designed paper ballots, just like ill-designed touchscreen interfaces, may lead to unintentional undervotes [24]. For instance, the 2006 Sarasota, Florida, touchscreen ballot was badly designed. The 2018 Broward County, Florida, opscan ballot was badly designed: it violated three separate guidelines from the EAC's 2007 publication, "Effective Designs for the Administration of Federal Elections, Section 3: Optical scan ballots." [39] In both of these cases (touchscreens in 2006, hand-marked optical-scan in 2018), undervote rates were high. The solution is to follow standard, published ballot-design guidelines and other best practices, both for touchscreens and for hand-marked ballots [3, 24].
- **Low-tech paper-ballot fraud.** All paper ballots, however they are marked, are vulnerable to *loss*, *ballot-box stuffing*, *alteration*, and *substitution* between the time they are cast and the time they are recounted. That's why it is so important to make sure that ballot boxes are always in multiple-person (preferably bipartisan) custody whenever they are handled, and that appropriate physical security measures are in place. Strong, verifiable chain-of-custody protections are essential.

  Hand-marked paper ballots are vulnerable to alteration by anyone with a pen. Both hand-marked and BMD-marked paper ballots are vulnerable to substitution: anyone who has poorly supervised access to a legitimate BMD during election day can create fraudulent ballots, not necessarily to deposit them in the ballot box immediately (in case the ballot box is well supervised on election day) but with the hope of substituting it later in the chain of custody.[28]

  All those attacks (on hand-marked and on BMD-marked paper ballots) are fairly low-tech. There are also higher-tech ways of producing ballots indistinguishable from BMD-marked ballots for substitution into the ballot box if there is inadequate chain-of-custody protection.
- **Accessible voting technology.** When hand-marked paper ballots are used with PCOS, there is (as required by law) also an accessible voting technology available in the polling place for voters unable to mark a paper ballot with a pen. This

[28] Some BMDs print a barcode indicating when and where the ballot was produced, but that does not prevent such a substitution attack against currently EAC-certified, commercially available BMDs. We understand that systems under development might make ballot-substitution attacks against BMDs more difficult.

is typically a BMD or a DRE. When the accessible voting technology is not the same as what most voters vote on—when it is used by very few voters—it may happen that the accessible technology is ill-maintained or even (in some polling places) not even properly set up by pollworkers. This is a real problem. One proposed solution is to require all voters to use the same BMD or all-in-one technology. But the failure of some election officials to properly maintain their accessible equipment is not a good reason to adopt BMDs for *all* voters. Among other things, it would expose all voters to the security flaws described above.[29] Other advocates object to the idea that disabled voters must use a different method of marking ballots, arguing that their rights are thereby violated. Both HAVA and ADA require reasonable accommodations for voters with physical and cognitive impairments, but neither law requires that those accommodations must be used by all voters. To best enable and facilitate participation by all voters, each voter should be provided with a means of casting a vote best suited to their abilities.

- **Ballot printing costs.** Preprinted optical-scan ballots cost 20–50 cents each.[30] Blank cards for BMDs cost up to 15 cents each, depending on the make and model of BMD.[31] But optical-scan ballots must be preprinted for as many voters as *might* show up, whereas blank BMD cards are consumed in proportion to how many voters *do* show up. The Open Source Election Technology Institute (OSET) conducted an independent study of total life cycle costs[32] for hand-marked paper ballots and BMDs in conjunction with the 2019 Georgia legislative debate regarding BMDs [26]. OSET concluded that, even in the most optimistic (i.e., lowest cost) scenario for BMDs and the most pessimistic (i.e, highest cost) scenario for hand-marked paper ballots and ballot-on-demand (BOD) printers—which can print unmarked ballots as needed—the total lifecycle costs for BMDs would be higher than the corresponding costs for hand-marked paper ballots.[33]
- **Vote centers.** To run a vote center that serves many election districts with different ballot styles, one must be able to provide each voter a ballot containing

[29] Also, some accessibility advocates argue that requiring disabled voters to use BMDs compromises their privacy since hand-marked ballots are easily distinguishable from machine marked ballots. That issue can be addressed without BMDs-for-all: Accessible BMDs are already available and in use that mark ballots with marks that cannot easily be distinguished from hand-marked ballots.

[30] Single-sheet (one- or two-side) ballots cost 20-28 cents; double-sheet ballots needed for elections with many contests cost up to 50 cents.

[31] Ballot cards for ES&S ExpressVote cost about 15 cents. New Hampshire's (One4All / Prime III) BMDs used by sight-impaired voters use plain paper that is less expensive.

[32] They include not only the cost of acquiring and implementing systems but also the ongoing licensing, logistics, and operating (purchasing paper stock, printing, and inventory management) costs.

[33] BOD printers currently on the market arguably are best suited for vote centers, but less expensive options suited for polling places could be developed. Indeed, BMDs that print full-face ballots could be re-purposed as BOD printers for polling place use, with modest changes to the programming.

the contests that voter is eligible to vote in, possibly in a number of different languages. This is easy with BMDs, which can be programmed with all the appropriate ballot definitions. With preprinted optical-scan ballots, the PCOS can be programmed to *accept* many different ballot styles, but the vote center must still maintain *inventory* of many different ballots. BOD printers are another economical alternative for vote centers.[34]

- **Paper/storage.** BMDs that print summary cards rather than full-face ballots can save paper and storage space. However, many BMDs print full-face ballots—so they do not save storage—while many BMDs that print summary cards (which could save storage) use thermal printers and paper that is fragile and can fade in a few months.[35]

Advocates of hand-marked paper ballot systems advance these additional arguments.

- **Cost.** Using BMDs for all voters substantially increases the cost of acquiring, configuring, and maintaining the voting system. One PCOS can serve 1200 voters in a day, while one BMD can serve only about 260 [33]—though both these numbers vary greatly depending on the length of the ballot and the length of the day. OSET analyzed the relative costs of acquiring BMDs for Georgia's nearly seven million registered voters versus a system of hand-marked paper ballots, scanners, and BOD printers [26]. A BMD solution for Georgia would cost taxpayers between 3 and 5 times more than a system based on hand-marked paper ballots. Open-source systems might eventually shift the economics, but current commercial universal-use BMD systems are more expensive than systems that use hand-marked paper ballots for most voters.
- **Mechanical reliability and capacity.** Pens are likely to have less downtime than BMDs. It is easy and inexpensive to get more pens and privacy screens when additional capacity is needed. If a precinct-count scanner goes down, people can still mark ballots with a pen; if the BMD goes down, voting stops. Thermal

[34] Ballot-on-demand printers *may* require maintenance such as replacement of toner cartridges. This is readily accomplished at a vote center with a professional staff. Ballot-on-demand printers may be a less attractive option for many small precincts on election day, where there is no professional staff—but on the other hand, they are less necessary, since far fewer ballot styles will be needed in any one precinct.

[35] The California Top-To-Bottom Review (TTBR) of voting systems found that thermal paper can also be covertly spoiled wholesale using common household chemicals https://votingsystems.cdn.sos.ca.gov/oversight/ttbr/red-diebold.pdf, last visited 8 April 2019. The fact that thermal paper printing can fade or deteriorate rapidly might mean it does not satisfy the federal requirement to preserve voting materials for 22 months. http://uscode.house.gov/view.xhtml?req=granuleid:USC-prelim-title52-section20701&num=0&edition=prelim, last visited 8 April 2019.

printers used in DREs with VVPAT are prone to jams; those in BMDs might have similar flaws.

These secondary pros and cons of BMDs do not outweigh the primary security and accuracy concern: BMDs, if hacked or erroneously programmed, can change votes in a way that is not correctable. BMD voting systems are not contestable or defensible. Audits that rely on BMD printout cannot make up for this defect in the paper trail: they cannot reliably detect or correct problems that altered election outcomes.

Barcodes

A controversial feature of some BMDs allows them to print 1-dimensional or 2-dimensional barcodes on the paper ballots. A 1-dimensional barcode resembles the pattern of vertical lines used to identify products by their universal product codes. A 2-dimensional barcode or QR code is a rectangular area covered in coded image *modules* that encode more complex patterns and information. BMDs print barcodes on the same paper ballot that contains human-readable ballot choices. Voters using BMDs are expected to verify the human-readable printing on the paper ballot card, but the presence of barcodes with human-readable text poses some significant problems.

- **Barcodes are not human readable.** The whole purpose of a paper ballot is to be able to recount (or audit) the *voters'* votes in a way independent of any (possibly hacked or buggy) computers. If the official vote on the ballot card is the barcode, then it is impossible for the voters to verify that the official vote they cast is the vote they expressed. Therefore, before a state even *considers* using BMDs that print barcodes (and we do not recommend doing so), the State must ensure by statute that recounts and audits are based *only* on the human-readable portion of the paper ballot. Even so, audits based on untrustworthy paper trails suffer from the verifiability the problems outlined above.
- **Ballot cards with barcodes contain two different votes.** Suppose a state does ensure by statute that recounts and audits are based on the human-readable portion of the paper ballot. Now a BMD-marked ballot card with both barcodes and human-readable text contains two different votes in each contest: the barcode (used for electronic tabulation), and the human-readable selection printout (official for audits and recounts). In few (if any) states has there even been a discussion of the legal issues raised when the official markings to be counted differ between the original count and a recount.
- **Barcodes pose technical risks.** Any coded input into a computer system—including wired network packets, WiFi, USB thumbdrives, *and barcodes*—pose

the risk that the input-processing software can be vulnerable to attack via deliberately ill-formed input. Over the past two decades, many such vulnerabilities have been documented on *each* of these channels (including barcode readers) that, in the worst case, give the attacker complete control of a system.[36] If an attacker were able to compromise a BMD, the barcodes are an attack vector for the attacker to take over an optical scanner (PCOS or CCOS), too. Since it is good practice to close down all such unneeded attack vectors into PCOS or CCOS voting machines (e.g., don't connect your PCOS to the Internet!), it is also good practice to avoid unnecessary attack channels such as barcodes.

End-to-End Verifiable BMDs

In all BMD systems currently on the market, and in all BMD systems certified by the EAC, the printed ballot or ballot summary is the only channel by which voters can verify the correct recording of their ballots, independently of the computers. The analysis in this paper applies to all of those BMD systems.

There is a class of voting systems called "end-to-end verifiable" (E2E-V), which provide an alternate mechanism for voters to verify their votes [2]. Some E2E-V systems incorporate BMDs, for instance STAR-Vote[37] [5]. As we discuss above in Section 1, such systems are not contestable, defensible, or strongly software independent. In any event, no E2E-V system is currently certified by the EAC, nor to our knowledge is any such system under review for certification, nor are any of the 5 major voting-machine vendors offering such a system for sale.[38]

[36] An example of a barcode attack is based on the fact that many commercial barcode-scanner components (which system integrators use to build cash registers or voting machines) treat the barcode scanner using the same operating-system interface as if it were a keyboard device; and then some operating systems allow "keyboard escapes" or "keyboard function keys" to perform unexpected operations.

[37] The STAR-Vote system is actually a DRE+VVPAT system with a smart ballot box, rather than a BMD system: voters interact with a device that captures their votes electronically and prints a paper record that voters can inspect, but the electronic votes are held "in limbo" until the paper ballot is deposited in the smart ballot box. The ballot box does not read the votes from the ballot; rather, depositing the ballot tells the system that it has permission to cast the vote that it had already recorded from the touchscreen.

[38] Some vendors, notably Scytl, have sold systems advertised as E2E-V in other countries. Those systems were not in fact E2E-V. Moreover, serious security flaws have been found in their implementations. See, e.g., [21].

5 Insecurity of All-in-One BMDs

Some voting machines incorporate a BMD interface, printer, and optical scanner into the same cabinet. Other DRE+VVPAT voting machines incorporate ballot-marking, tabulation, and paper-printout retention, but without scanning. These are often called "all-in-one" voting machines. To use an all-in-one machine, the voter makes choices on a touchscreen or through a different accessible interface. When the selections are complete, the BMD prints the completed ballot for the voter to review and verify, before depositing the ballot in a ballot box attached to the machine.

Such machines are especially unsafe: like any BMD described in Section 3 they are not contestable or defensible, but in addition, if hacked they can print votes onto the ballot *after* the voter last inspects the ballot.

- The ES&S ExpressVote (in all-in-one mode) allows the voter to mark a ballot by touchscreen or audio interface, then prints a paper ballot card and ejects it from a slot. The voter has the opportunity to review the ballot, then the voter redeposits the ballot into the same slot, where it is scanned and deposited into a ballot box.
- The ES&S ExpressVoteXL allows the voter to mark a ballot by touchscreen or audio interface, then prints a paper ballot and displays it under glass. The voter has the opportunity to review the ballot, then the voter touches the screen to indicate "OK," and the machine pulls paper ballot up (still under glass) and into the integrated ballot box.
- The Dominion ImageCast Evolution (ICE) allows the voter to deposit a hand-marked paper ballot, which it scans and drops into the attached ballot box. *Or*, a voter can use a touchscreen or audio interface to direct the marking of a paper ballot, which the voting machine ejects through a slot for review; then the voter redeposits the ballot into the slot, where it is scanned and dropped into the ballot box.

In all three of these machines, the ballot-marking printer is in the same paper path as the mechanism to deposit marked ballots into an attached ballot box. This opens up a very serious security vulnerability: the voting machine can mark the paper ballot (to add votes or spoil already-cast votes) after the last time the voter sees the paper, and then deposit that marked ballot into the ballot box without the possibility of detection.

Vote-stealing software could easily be constructed that looks for *undervotes* on the ballot, and marks those unvoted spaces for the candidate of the hacker's choice. This is very straightforward to do on optical-scan bubble ballots (as on the Dominion ICE) where undervotes are indicated by no mark at all. On machines such as the ExpressVote

and ExpressVoteXL, the normal software indicates an undervote with the words NO SELECTION MADE on the ballot summary card. Hacked software could simply leave a blank space there (most voters wouldn't notice the difference), and then fill in that space and add a matching bar code after the voter has clicked "cast this ballot."

An even worse feature of the ES&S ExpressVote and the Dominion ICE is the *auto-cast* configuration setting (in the manufacturer's standard software) that allows the voter to indicate, "don't eject the ballot for my review, just print it and cast it without me looking at it." If fraudulent software were installed in the ExpressVote, it could change *all* the votes of any voter who selected this option, because the voting machine software would know *in advance of printing* that the voter had waived the opportunity to inspect the printed ballot. We call this auto-cast feature "permission to cheat" [4].

Regarding these all-in-one machines, we conclude:

- Any machine with ballot printing in the same paper path with ballot deposit is not *software independent*; it is *not* the case that "an error or fault in the voting system software or hardware cannot cause an undetectable change in election results." Therefore such all-in-one machines do not comply with the VVSG 2.0 (the Election Assistance Commission's Voluntary Voting Systems Guidelines). Such machines are not contestable or defensible, either.
- All-in-one machines on which all voters use the BMD interface to mark their ballots (such as the ExpressVote and ExpressVoteXL) *also* suffer from the same serious problem as ordinary BMDs: most voters do not review their ballots effectively, and elections on these machines are not contestable or defensible.
- The auto-cast option for a voter to allow the paper ballot to be cast without human inspection is particularly dangerous, and states must insist that vendors disable or eliminate this mode from the software. However, even disabling the auto-cast feature does not eliminate the risk of undetected vote manipulation.

Remark. The Dominion ImageCast Precinct ICP320 is a precinct-count optical scanner (PCOS) that also contains an audio+buttons ballot-marking interface for disabled voters. This machine can be configured to cast electronic-only ballots from the BMD interface, or an external printer can be attached to print paper optical-scan ballots from the BMD interface. When the external printer is used, that printer's paper path is *not* connected to the scanner+ballot-box paper path (a person must take the ballot from the printer and deposit it into the scanner slot). Therefore this machine is as safe to use as any PCOS with a separate external BMD.

6 Conclusion

Ballot-Marking Devices produce ballots that do not necessarily record the vote expressed by the voter when they enter their selections on the touchscreen: hacking, bugs, and configuration errors can cause the BMDs to print votes that differ from what the voter entered and verified electronically. Because outcome-changing errors in BMD printout do not produce public evidence, BMD systems are not *contestable*. Because there is no way to generate convincing public evidence that reported outcomes are correct despite any BMD malfunctions that might have occurred, BMD systems are not *defensible*. Therefore, BMDs should not be used by voters who can hand mark paper ballots.

All-in-one voting machines, which combine ballot-marking and ballot-box-deposit into the same paper path, are even worse. They have all the disadvantages of BMDs (they are not contestable or defensible), and they can mark the ballot after the voter has inspected it. Therefore they are not even *software independent*, and should not be used by those voters who are capable of marking, handling, and visually inspecting a paper ballot.

When computers are used to record votes, the original transaction (the voter's expression of the votes) is not documented in a verifiable way.[39] When pen-and-paper is used to record the vote, the original expression of the vote *is* documented in a verifiable way (if demonstrably secure chain of custody of the paper ballots is maintained). Audits of elections conducted with hand-marked paper ballots, counted by optical scanners, can ensure that reported election outcomes are correct. Audits of elections conducted with BMDs *cannot* ensure that reported outcomes are correct.

[39] It is conceivable that cryptographic protocols like those used in E2E-V systems could be used to create BMD-based systems that are contestable and defensible, but no such system exists, nor, to our knowledge, has such a design been worked out in principle. Existing E2E-V systems that use a computer to print (encrypted) selections are neither contestable nor defensible, as explained in Section 1.

Ruth R. Hughs
Secretary of State

REPORT OF REVIEW OF DOMINION VOTING SYSTEMS DEMOCRACY SUITE 5.5-A

PRELIMINARY STATEMENT

On October 2-3, 2019, Dominion Voting Systems ("Dominion" or the "Vendor") presented the Democracy Suite 5.5-A system for examination and certification. The examination was conducted in Austin, Texas. Pursuant to Sections 122.035(a) and (b) of the Texas Election Code, the Secretary of State appointed the following examiners:

1. Mr. Tom Watson, an expert in electronic data communication systems;
2. Mr. Brian Mechler, an expert in electronic data communication systems;
3. Mr. Brandon Hurley, an expert in election law and procedure; and
4. Mr. Charles Pinney, an expert in election law and procedure.

Pursuant to Section 122.035(a), the Texas Attorney General appointed the following examiners:

1. Dr. Jim Sneeringer, an expert in electronic data communication systems; and
2. Mr. Ryan Vassar, an employee of the Texas Attorney General.

On October 2, 2019, Mr. Pinney, Mr. Mechler, and Dr. Sneeringer witnessed the installation of the Democracy Suite 5.5-A software and firmware that the Office of the Texas Secretary of State (the "Office") received directly from the Independent Testing Authority. The next day, Mr. Pinney examined the accessibility components of the ImageCast X Ballot Marking Device.

On October 3, 2019, the Vendor demonstrated the Democracy Suite 5.5-A system and answered questions presented by the examiners. Test ballots were then processed on each voting device. The results were accumulated and later verified for accuracy by staff of the Secretary of State.

Examiner reports regarding the Democracy Suite 5.5-A system are attached hereto and incorporated herein by this reference.

BRIEF DESCRIPTION OF DEMOCRACY SUITE 5.5-A

The Democracy Suite 5.5-A system is an updated version of the Democracy Suite 5.5 system, which was denied certification by the Office on June 20, 2019. The Democracy Suite 5.5-A system includes certain software and hardware updates to the Suite 5.5 version.

Democracy Suite 5.5-A has been evaluated at an accredited independent voting system laboratory for conformance to the 2005 Voluntary Voting System Guidelines (VVSG). Democracy Suite 5.5-A was certified by the Election Assistance Commission (EAC) on January 30, 2019.

The components of Democracy Suite 5.5-A are as follows:

Component	Version	Description
EMS – Election Management System	5.5.12.1	Election Management System
ADJ – Adjudication	5.5.8.1	
ICC – ImageCast Central	5.5.3.0002	Central scanner
ICX – ImageCast X BMD	5.5.10.30	Ballot marking device
ICP – ImageCast Precinct	5.5.3-0002	Precinct scanner

FINDINGS

The following are the findings, based on written evidence submitted by the Vendor in support of its application for certification, oral evidence presented at the examination, and the findings of the voting system examiners as set out in their written reports.

The examiner reports identified multiple hardware and software issues that preclude the Office of the Texas Secretary of State from determining that the Democracy Suite 5.5-A system satisfies each of the voting-system requirements set forth in the Texas Election Code. Specifically, the examiner reports raise concerns about whether the Democracy Suite 5.5-A system is suitable for its intended purpose; operates efficiently and accurately; and is safe from fraudulent or unauthorized manipulation. Therefore, the Democracy Suite 5.5-A system and corresponding hardware devices do not meet the standards for certification prescribed by Section 122.001 of the Texas Election Code.

CONCLUSION

Accordingly, based upon the foregoing, I hereby deny certification of Dominion Voting Systems' Democracy Suite 5.5-A system for use in Texas elections.

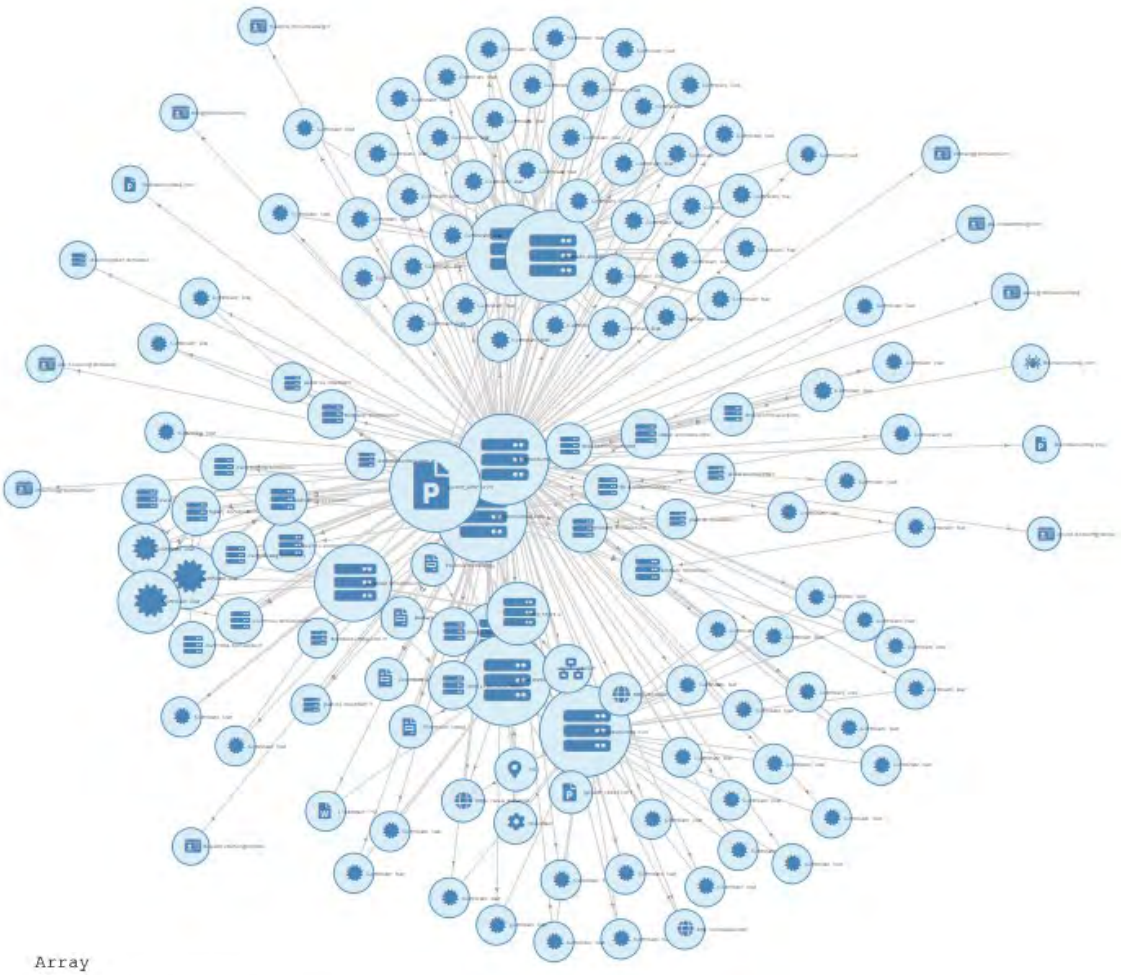
Signed under my hand and seal of office, this 24th day of January 2020.

JOSE A. ESPARZA
DEPUTY SECRETARY OF STATE

Declaration of [redacted]

Pursuant to 28 U.S.C Section 1746, [redacted] make the following declaration.

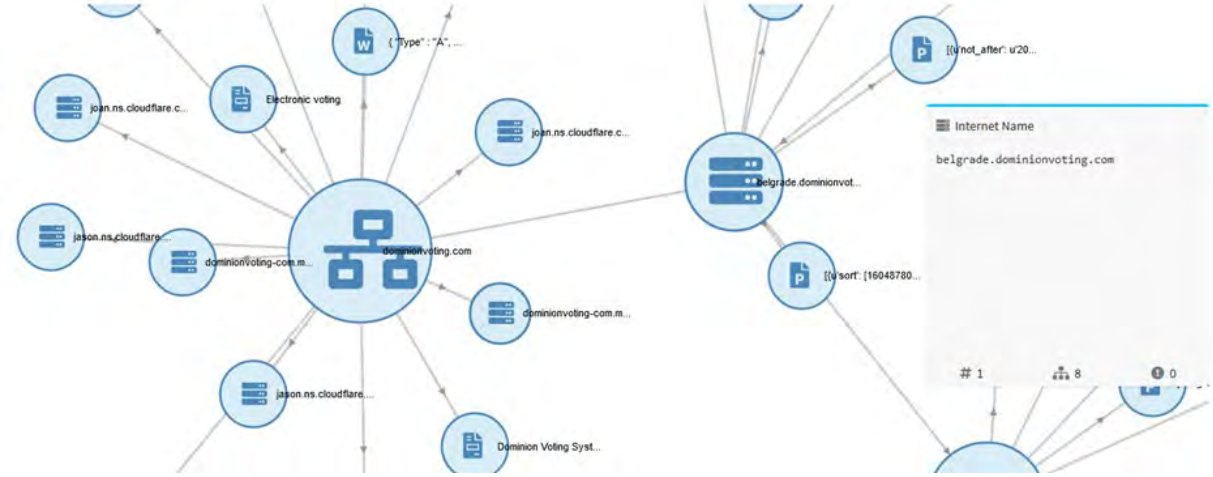
1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. I was an electronic intelligence analyst under 305th Military Intelligence with experience gathering SAM missile system electronic intelligence. I have extensive experience as a white hat hacker used by some of the top election specialists in the world. The methodologies I have employed represent industry standard cyber operation toolkits for digital forensics and OSINT, which are commonly used to certify connections between servers, network nodes and other digital properties and probe to network system vulnerabilities.
3. I am a US citizen and I reside [redacted] location in the United States of America.
4. Whereas the Dominion and Edison Research systems exist in the internet of things, and whereas this makes the network connections between the Dominion, Edison Research and related network nodes available for scanning,
5. And whereas Edison Research's primary job is to report the tabulation of the count of the ballot information as received from the tabulation software, to provide to Decision HQ for election results,
6. And whereas Spiderfoot and Robtex are industry standard digital forensic tools for evaluation network security and infrastructure, these tools were used to conduct public security scans of the aforementioned Dominion and Edison Research systems,
7. A public network scan of Dominionvoting.com on 2020-11-08 revealed the following inter-relationships and revealed 13 unencrypted passwords for dominion employees, and 75 hashed passwords available in TOR nodes:

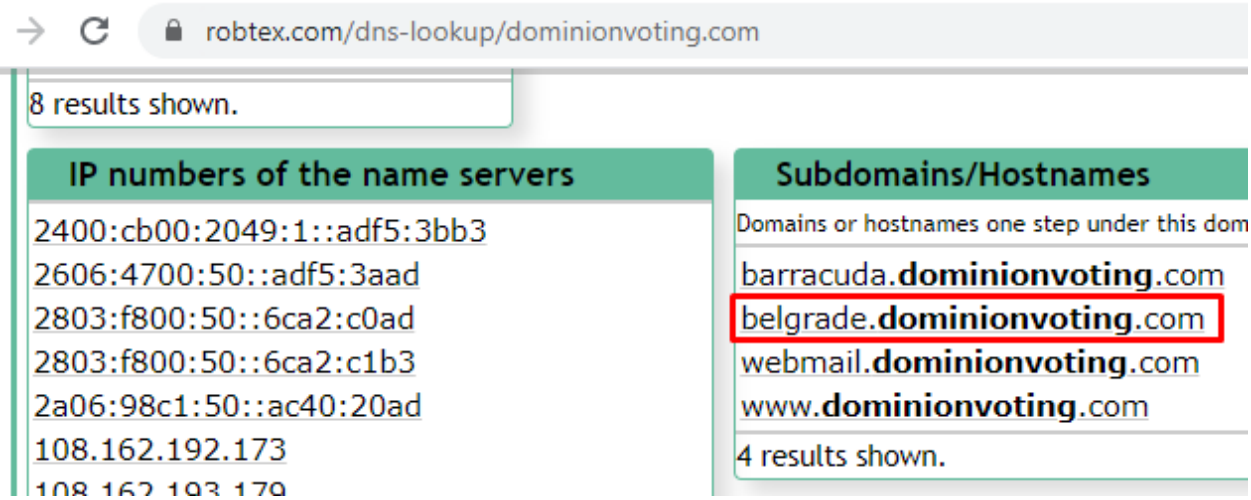


```
Array
(
    [id] => 544167324
    [luser] => ian.macvicar
    [domain] => dominionvoting.com
    [password] => jamley
)

7
Array
(
    [id] => 599400504
    [luser] => jelena.tanaskovic
    [domain] => dominionvoting.com
```

8. The same public scan also showed a direct connection to the group in Belgrade as highlighted below:





9. A cursory search on LinkedIn of "dominion voting" on 11/19/2020 confirms the numerous employees in Serbia:

10. An additional search of Edison Research on 2020-11-08 showed that Edison Research has an Iranian server seen here:

Inputting the Iranian IP into Robtex confirms the direct connection into the "edisonresearch" host from the perspective of the Iranian domain also. This means that it is not possible that the connection was a unidirectional reference.

A deeper search of the ownership of Edison Research "edisonresearch.com" shows a connection to BMA Capital Management, where shareofear.com and bmacapital.com are both connected to edisonresearch.com via a VPS or Virtual Private Server, as denoted by the "vps" at the start of the internet name:

Dominionvoting is also dominionvotingsystems.com, of which there are also many more examples, including access of the network from China. The records of China accessing the server are reliable.

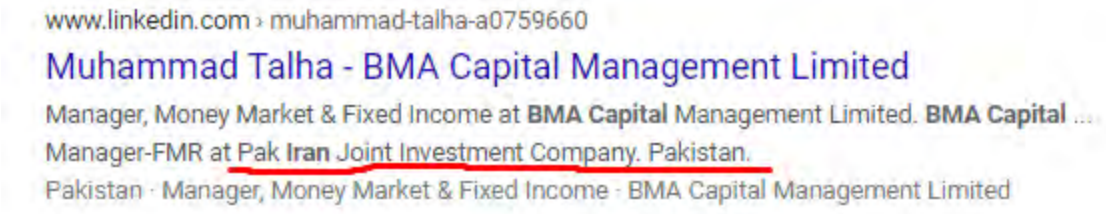
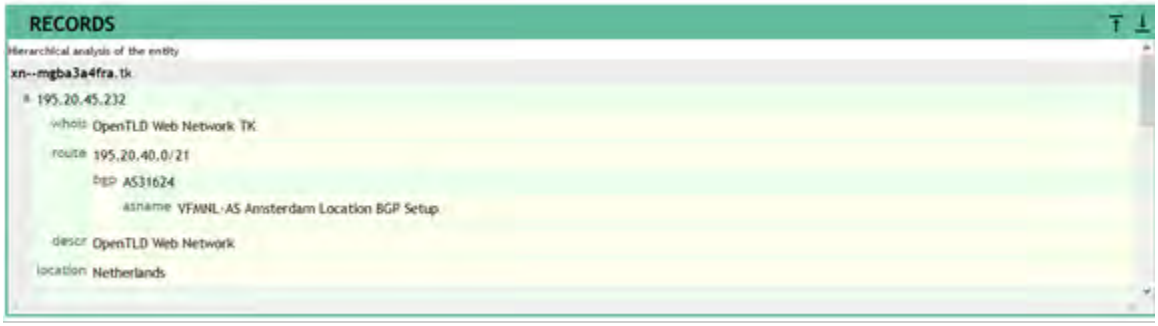
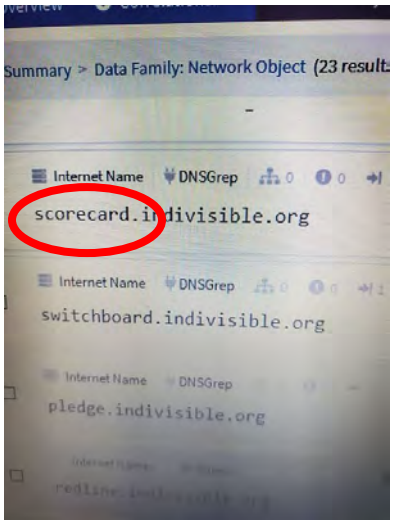
11. BMA Capital Management is known as a company that provides Iran access to capital markets with direct links publicly discoverable on LinkedIn (found via google on 11/19/2020):



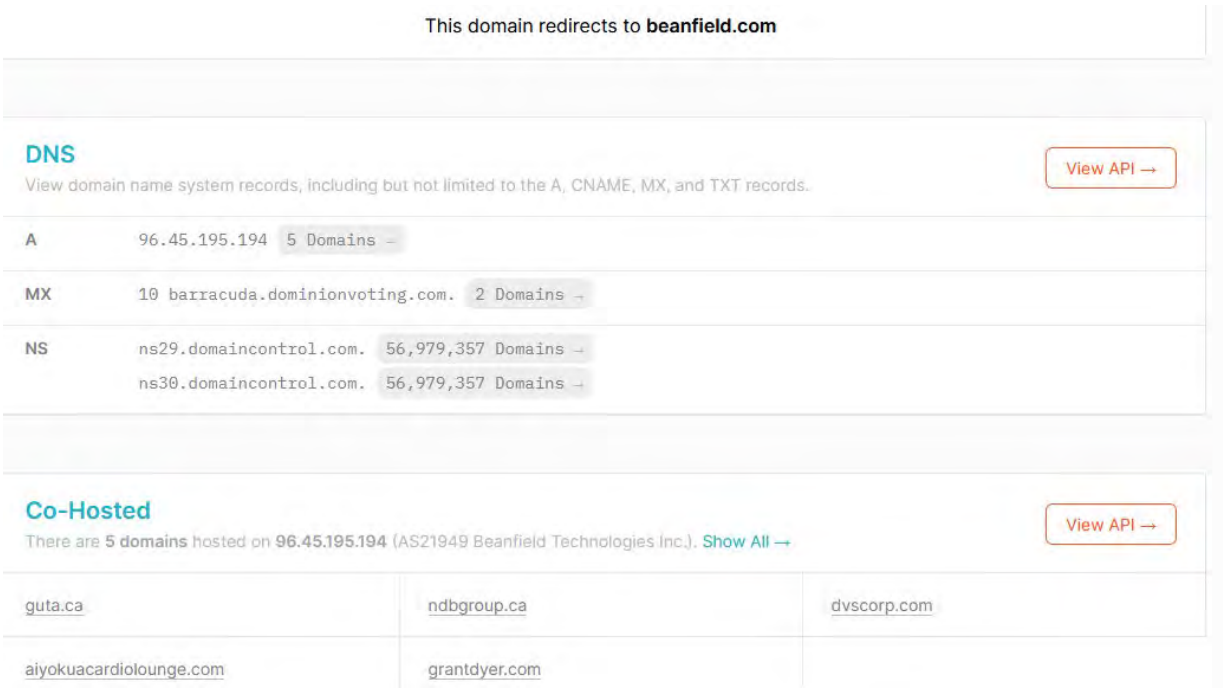
The same Robtex search confirms the Iranian address is tied to the server in the Netherlands, which correlates to known OSINT of Iranian use of the Netherlands as a remote server (See Advanced Persistent Threats: APT33 and APT34):



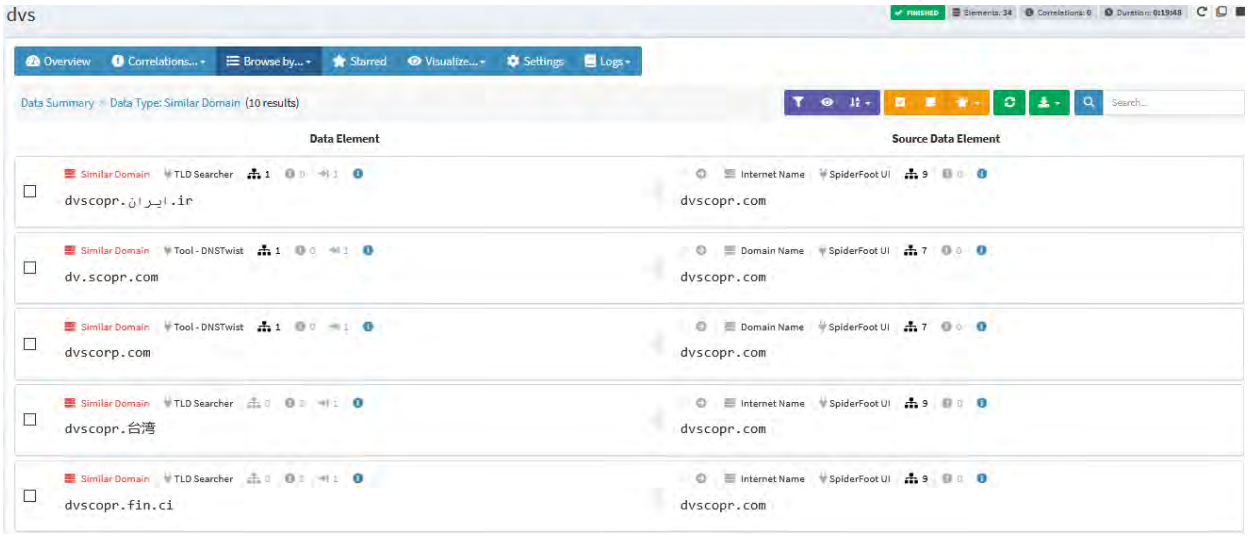
12. A search of the indivisible.org network showed a subdomain which evidences the existence of scorecard software in use as part of the Indivisible (formerly ACORN) political group for Obama:

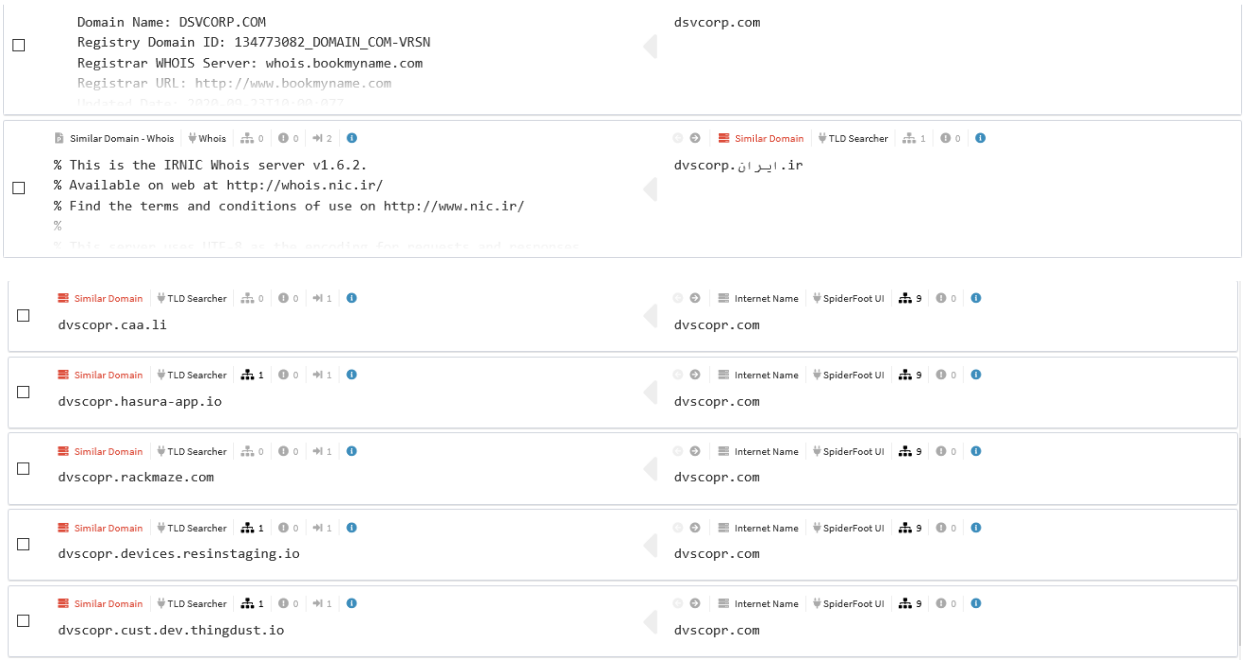


13. Each of the tabulation software companies have their own central reporting "affiliate". Edison Research is the affiliate for Dominion.
14. Beanfield.com out of Canada shows the connections via co-hosting related sites, including dvscorp.com:



This Dominion partner domain “dvscorp” also includes an auto discovery feature, where new in-network devices automatically connect to the system. The following diagram shows some of the related dvscopr.com mappings, which mimic the infrastructure for Dominion and are an obvious typo derivation of the name. Typo derivations are commonly purchased to catch redirect traffic and sometimes are used as honeypots. The diagram shows that infrastructure spans multiple different servers as a methodology.





The above diagram shows how these domains also show the connection to Iran and other places, including the following Chinese domain, highlighted below:

15. The auto discovery feature allows programmers to access any system while it is connected to the internet once it's a part of the constellation of devices (see original Spiderfoot graph).
16. Dominion Voting Systems Corporation in 2019 sold a number of their patents to China (via HSBC Bank in Canada):

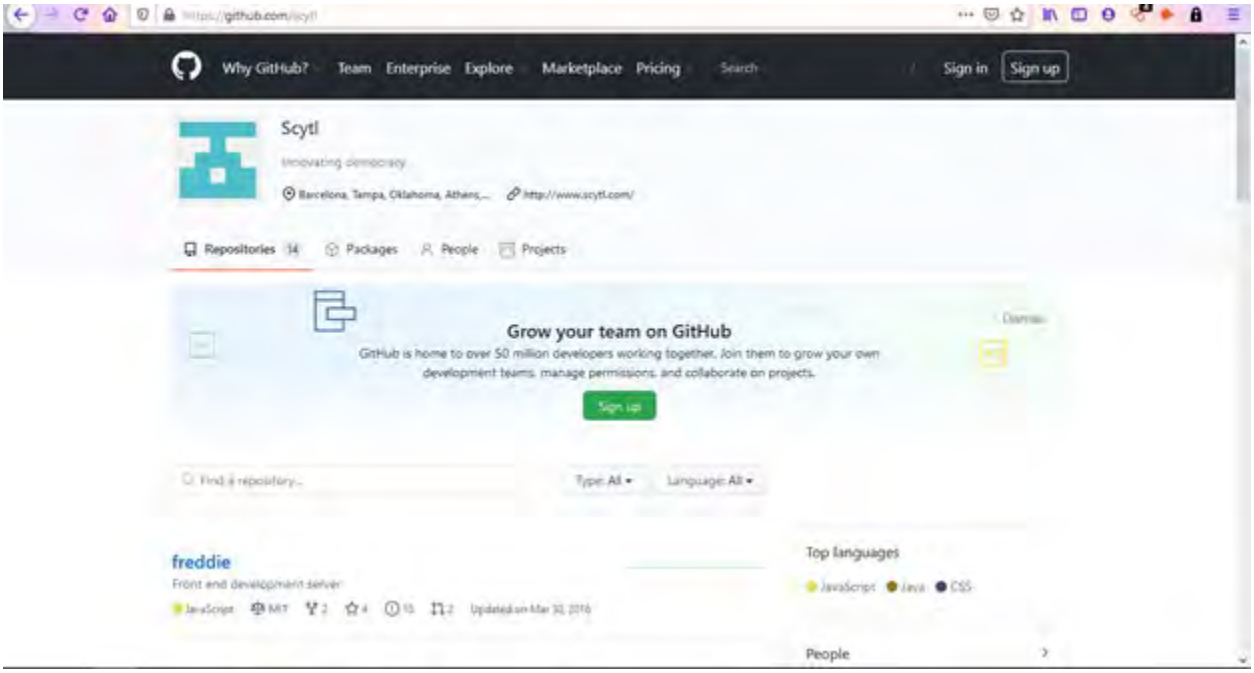
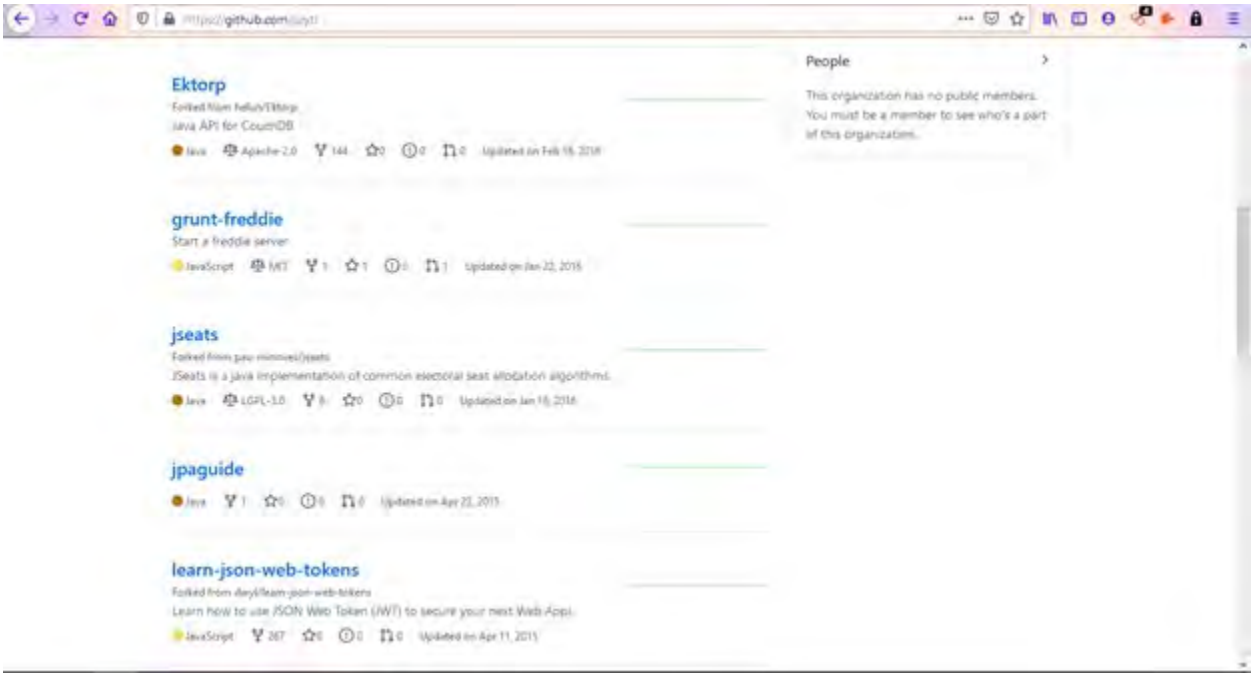
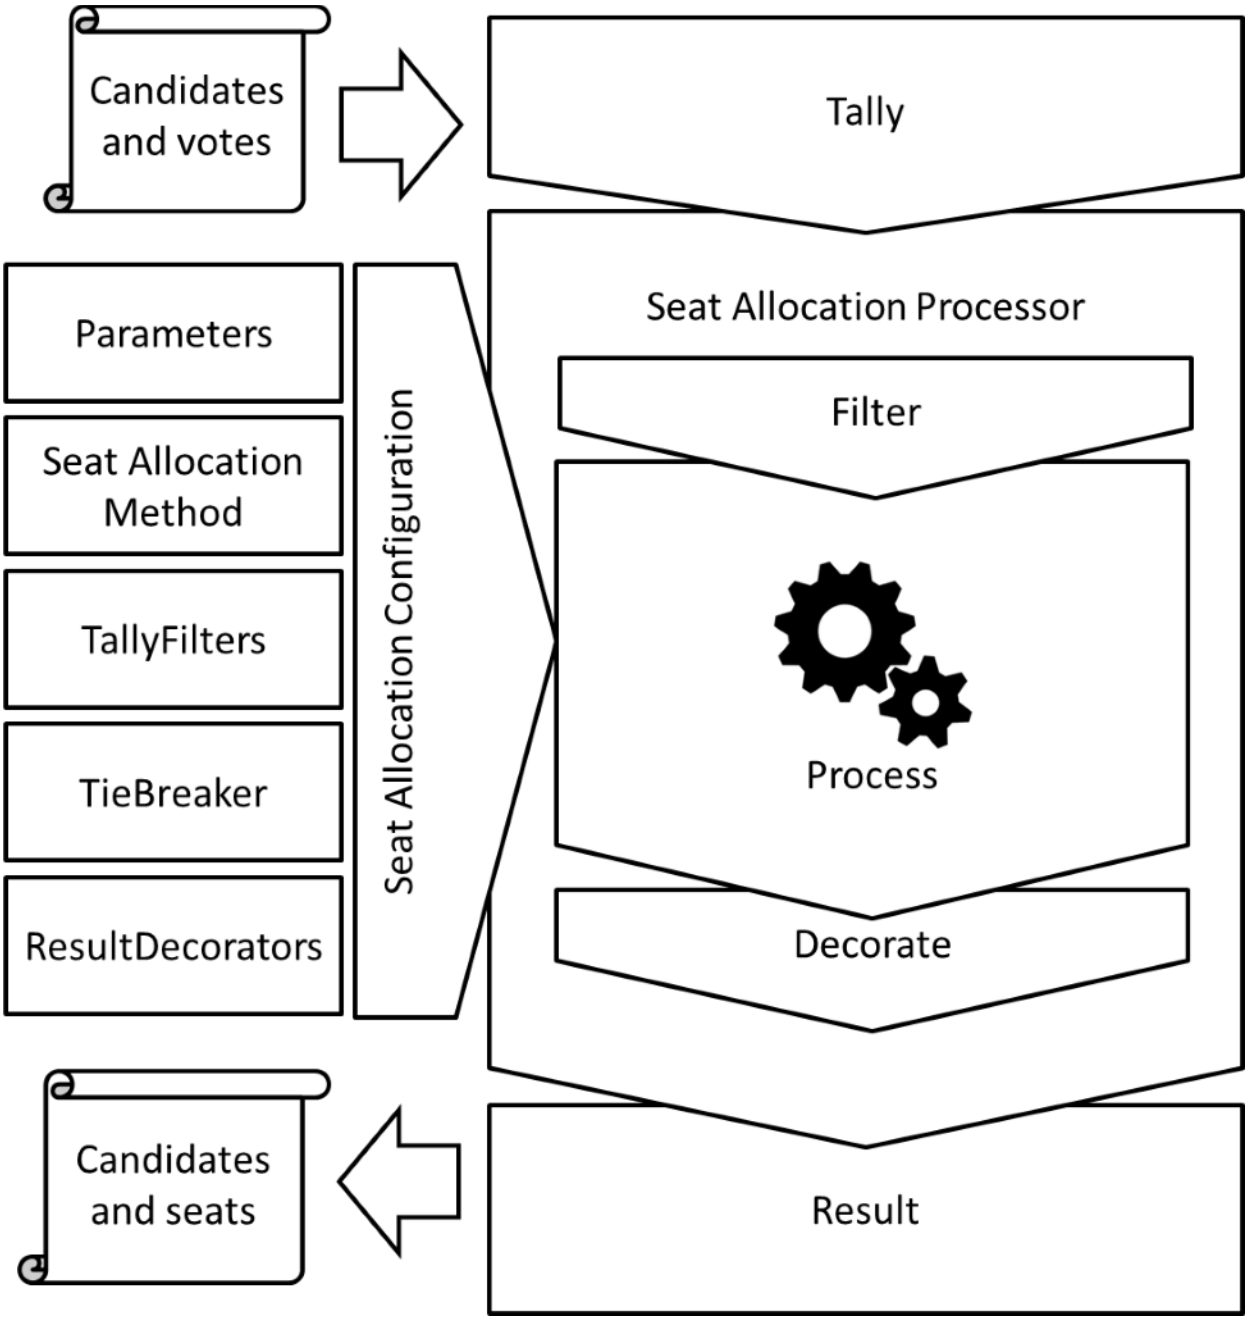
17. Smartmatic creates the backbone (like the cloud). SCYTL is responsible for the security within the election system.

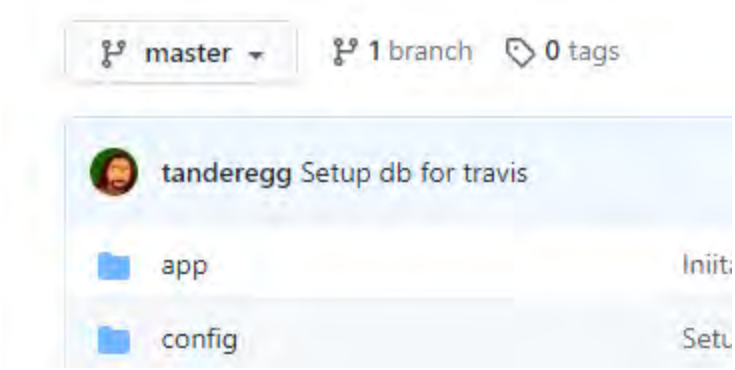




18. In the GitHub account for Scytl, Scytl Jseats has some of the programming necessary to support a much broader set of election types, including a decorator process where the data is smoothed, see the following diagram provided in their source code:



19. Unrelated, but also a point of interest is CTCL or Center for Tech and Civic Life funded by Mark Zuckerberg. Within their github page (https://github.com/ctcl), one of the programmers holds a government position. The Bipcoop repo shows tanderegg as one of the developers, and he works at the Consumer Financial Protection Bureau:



20. As seen in included document titled "AA20-304A-Iranian_Advanced_Persistent_Threat_Actor_Identified_Obtaining_Voter_Registration_Data " that was authored by the Cybersecurity & Infrastructure Security Agency (CISA) with a Product ID of AA20-304A on a specified date of October 30, 2020, CISA and the FBI reports that Iranian APT teams were seen using ACUTENIX, a website scanning software, to find vulnerabilities within Election company websites, confirmed to be used by the Iranian APT teams buy seized cloud storage that I had personally captured and reported to higher authorities. These scanning behaviors showed that foreign agents of aggressor nations had access to US voter lists, and had done so recently.
21. In my professional opinion, this affidavit presents unambiguous evidence that Dominion Voter Systems and Edison Research have been accessible and were certainly compromised by rogue actors, such as Iran and China. By using servers and employees connected with rogue actors and hostile foreign influences combined with numerous easily discoverable leaked credentials, these organizations neglectfully allowed foreign adversaries to access data

and intentionally provided access to their infrastructure in order to monitor and manipulate elections, including the most recent one in 2020. This represents a complete failure of their duty to provide basic cyber security. This is not a technological issue, but rather a governance and basic security issue: if it is not corrected, future elections in the United States and beyond will not be secure and citizens will not have confidence in the results.

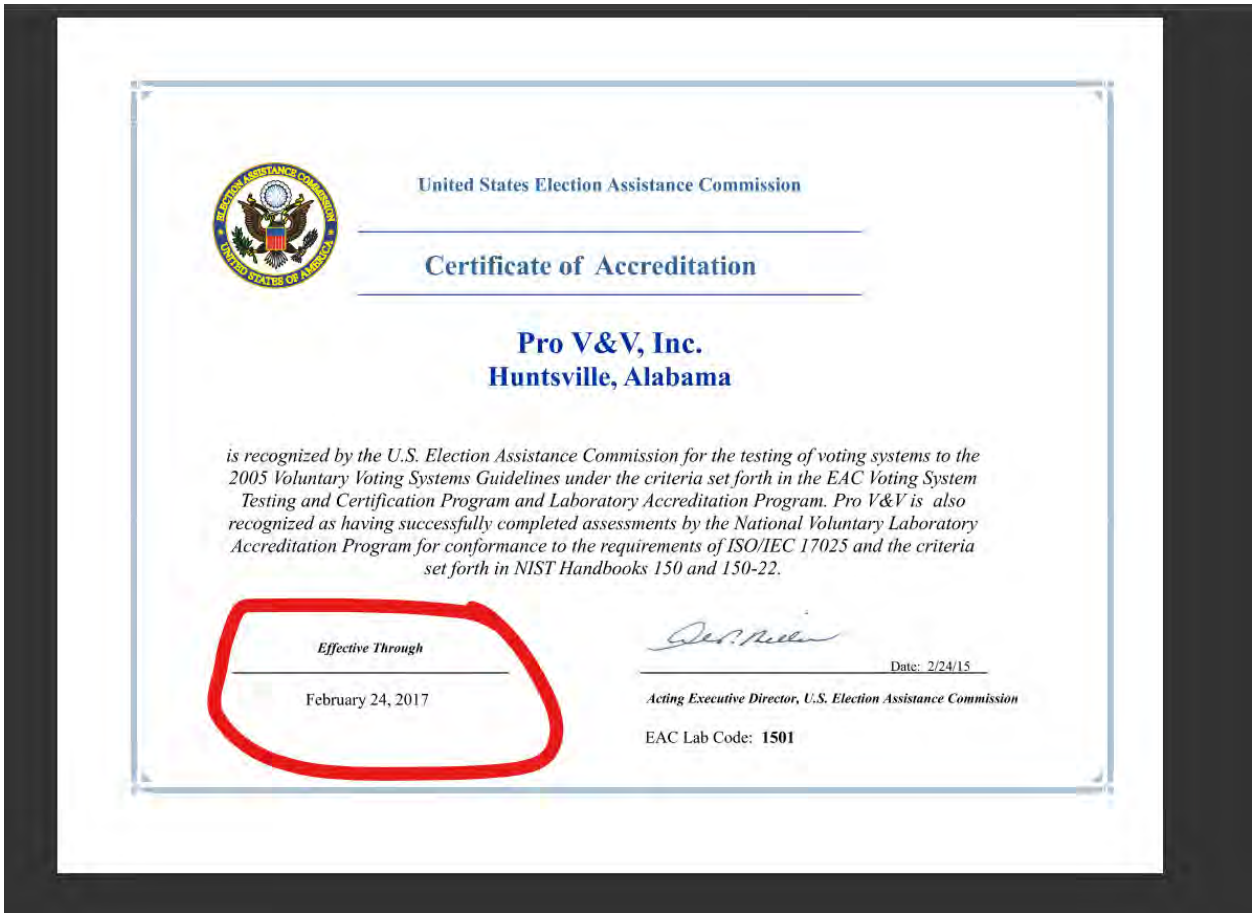
I declare under penalty of perjury that the forgoing is true and correct to the best of my knowledge. Executed this November 23th, 2020.

Declaration of [redacted]

Pursuant to 28 U.S.C Section 1746, I, [redacted], make the following declaration.

1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. I have been a private contractor with experience gathering and analyzing foreign intelligence and acted as a LOCALIZER during the deployment of projects and operations both OCONUS and CONUS. I am a trained Cryptolinguist, hold a completed degree in Molecular and Cellular Physiology and have FORMAL training in other sciences such as Computational Linguistics, Game Theory, Algorithmic Aspects of Machine Learning, Predictive Analytics among others.
3. I have operational experience in sources and methods of implementing operations during elections both CONUS and OCONUS
4. I am an amateur network tracer and cryptographer and have over two decades of mathematical modeling and pattern analysis.
5. In my position from 1999-2014 I was responsible for delegating implementation via other contractors sub-contracting with US or 9 EYES agencies identifying connectivity, networking and subcontractors that would manage the micro operations.
6. My information is my personal knowledge and ability to detect relationships between the companies and validate that with the cryptographic knowledge I know and attest to as well as evidence of these relationships.
7. In addition, I am WELL versed due to my assignments during my time as a private contractor of how elections OCONUS (for countries I have had an assignment at) and CONUS (well versed in HAVA ACT) and more.
8. On or about October 2017 I had reached out to the US Senate Majority Leader with an affidavit claiming that our elections in 2017 may be null and void due to lack of EAC certifications. In fact Sen. Wyden sent a letter to Jack Cobb on 31 OCT 2017 advising discreetly pointing out the importance of being CERTIFIED EAC had issued a certificate to

Pro V & V and that expired on Feb 24, 2017. No other certification has been located.



United States Election Assistance Commission

Certificate of Accreditation

Pro V&V, Inc.
Huntsville, Alabama

is recognized by the U.S. Election Assistance Commission for the testing of voting systems to the 2005 Voluntary Voting Systems Guidelines under the criteria set forth in the EAC Voting System Testing and Certification Program and Laboratory Accreditation Program. Pro V&V is also recognized as having successfully completed assessments by the National Voluntary Laboratory Accreditation Program for conformance to the requirements of ISO/IEC 17025 and the criteria set forth in NIST Handbooks 150 and 150-22.

Effective Through

February 24, 2017

Date: 2/24/15

Acting Executive Director, U.S. Election Assistance Commission

EAC Lab Code: **1501**

9. Section 231(b) of the Help America Vote Act (HAVA) of 2002 (42 U.S.C. §15371(b)) requires that the EAC provide for the accreditation and revocation of accreditation of independent, non-federal laboratories qualified to test voting systems to Federal standards. Generally, the EAC considers for accreditation those laboratories evaluated and recommended by the National Institute of Standards and Technology (NIST) pursuant to HAVA Section 231(b)(1). However, consistent with HAVA Section 231(b)(2)(B), the Commission may also vote to accredit laboratories outside of those recommended by NIST upon publication of an explanation of the reason for any such accreditation.

10. 

United States Department of Commerce

NVLAP®

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 200978-0

Pro V&V
Huntsville, AL

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Voting System Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).

2020-03-26 through 2021-03-31
Effective Dates

For the National Voluntary Laboratory Accreditation Program

11. VSTL's are VERY important because equipment vulnerabilities allow for deployment of algorithms and scripts to intercept, alter and adjust voting tallies.
12. There are only TWO accredited VSTLs (VOTING SYSTEM TEST LABORATORIES). In order to meet its statutory requirements under HAVA §15371(b), the EAC has developed the EAC's Voting System Test Laboratory Accreditation Program. The procedural requirements of the program are established in the proposed information collection, the EAC **Voting System Test Laboratory Accreditation Program Manual**. Although participation in the program is voluntary, adherence to the program's procedural requirements is mandatory for participants. The procedural requirements of this Manual will supersede any prior laboratory accreditation requirements issued by the EAC. This manual shall be read in conjunction with the EAC's **Voting System Testing and Certification Program Manual** (OMB 3265-0019).

MICHIGAN

State Participation:	**Requires Testing by an Independent Testing Authority.** MI requires that voting systems are certified by an independent testing authority accredited by NASED and the board of state canvassers.
Applicable Statute(s):	"An electronic voting system shall not be used in an election unless it is approved by the board of state canvassers … and unless it meets 1 of the following conditions: (a) Is certified by an independent testing authority accredited by the national association of state election directors and by the board of state canvassers. (b) In the absence of an accredited independent testing authority, is certified by the manufacturer of the voting system as meeting or exceeding the performance and test standards referenced in subdivision (a) in a manner prescribed by the board of state canvassers." MICH. COMP. LAWS ANN § 168.795a (2009).
Applicable Regulation(s):	MI does not have a regulation regarding the federal certification process.
State Certification Process:	The Secretary of State accepts requests from persons/corporations wishing to have their voting system examined. The requestor must pay the Secretary of State an application fee of $1,500.00, file a report listing all of the states in which the voting system has been approved and any reports that these states have made regarding the performance of the voting system. The Board of State Canvassers conducts a field test involving Michigan electors and election officials in simulated election day conditions. The Board of State Canvassers shall approve the voting system if it meets all of the state requirements. MICH. COMP. LAWS ANN § 168.795a (2009).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://www.michigan.gov/sos/0,1607,7-127-1633_8716_45458---,00.html

13.

WISCONSIN

State Participation:	**Requires Testing by a Federally Accredited Laboratory.** WI requires that its voting systems receive approval from an independent testing authority accredited by NASED verifying that the voting systems meet all of the recommended FEC standards.
Applicable Statute(s):	"No ballot, voting device, automatic tabulating equipment or relating equipment and materials to be used in an electronic voting system may be utilized in this state unless it is approved by the board [of election commissioners]." WIS. STAT.ANN. § 5.91 (West 2009).
Applicable Regulation(s):	"An application for approval of an electronic voting system shall be accompanied by all of the following … [r]eports from an independent testing authority accredited by the national association of state election directors (NASED) demonstrating that the voting system conforms to all the standards recommended by the federal elections commission." WIS. ADMIN. CODE GAB § 7.01 (2009).
State Certification Process:	The Board of Election Commissioners accepts applications for the approval of electronic voting systems. Once the application is completed, the vendor must set up the voting system for three mock elections using; (1) offices, (2) referenda questions and (3) candidates. A panel of local election officials can assist the Board in the review of the voting system. The Board conducts the test using a mock election for the partisan primary, general election, and nonpartisan election. The Board may also require that the voting system be used in an actual election as a condition of the approval. WIS. ADMIN. CODE GAB §§ 7.01, 7.02 (2009).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://elections.state.wi.us/section.asp?linkid=643&locid=47

14.

U.S. Election Assistance Commission

GEORGIA

State Participation:

Requires Federal Certification. GA requires that its voting systems are tested to EAC standards by EAC accredited labs and certified by the EAC.

Applicable Statute(s):

"Any person or organization owning, manufacturing, or selling, or being interested in the manufacture or sale of, any voting machine may request the Secretary of State to examine the machine. Any ten or more electors of this state may, at any time, request the Secretary of State to reexamine any voting machine previously examined and approved by him or her. Before any such examination or reexamination, the person, persons, or organization requesting such examination or reexamination shall pay to the Secretary of State the reasonable expenses of such examination; provided, however, that in the case of a request by ten or more electors the examination fee shall be $ 250.00. The Secretary of State may, at any time, in his or her discretion, reexamine any voting machine." GA CODE ANN. § 21-2-324 (2008).

Applicable Regulation(s):

"Prior to submitting a voting system for certification by the State of Georgia, the proposed voting system's hardware, firmware, and software must have been issued Qualification Certificates from the EAC. These EAC Qualification Certificates must indicate that the proposed voting system has successfully completed the EAC Qualification testing administered by EAC approved ITAs. If for any reason, this level of testing is not available, the Qualification tests shall be conducted by an agency designated by the Secretary of State. In either event, the Qualification tests shall comply with the specifications of the *Voting Systems Standards* published by the EAC." GA. COMP. R. & RES. 590-8-1-.01 (2009).

State Certification Process:

After the voting system has passed EAC Qualification testing, the vendor of the voting system submits a letter to the Office of the Secretary of State requesting certification for the voting system along with a technical data package to the certification agent. An evaluation proposal is created by the certification agent after a preliminary view of the Technical Data Package and sent to the vendor. Any additional EAC ITA testing identified in the evaluation proposal is arranged by the vendor and the certification agent will perform all other tests identified in the evaluation proposal. The certification agent submits a report of their findings to the Secretary of State. Based on these findings the Secretary of State will make a final determination on whether to certify the voting system. GA. COMP. R. & RES. 590-8-1-.01 (2009).

Fielded Voting Systems:

[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].
http://www.sos.georgia.gov/Elections/

15.

U.S. Election Assistance Commission

PENNSYVANIA

State Participation:	**Requires Testing by a Federally Accredited Laboratory.** PA requires that its voting systems are approved by a federally recognized independent testing laboratory as meeting federal voting system standards.
Applicable Statute(s):	"Any person or corporation owning, manufacturing or selling, or being interested in the manufacture or sale of, any electronic voting system, may request the Secretary of the Commonwealth to examine such system if the voting system has been examined and approved by a federally recognized independent testing authority and if it meets any voting system performance and test standards established by the Federal Government." 25 PA. CONS. STAT. ANN. Code § 3031.5 (West 2008).
Applicable Regulation(s):	PA does not have a regulation regarding the federal certification process.
State Certification Process:	The Secretary of State examines voting systems, upon request, once the voting systems have received approval by a federally recognized independent testing authority. The person(s) requesting the examination of the voting system are responsible for the cost of the examination. After the examination, the Secretary of State issues a report stating whether or not the voting systems are safe and compliant with state and federal requirements. If the voting systems are deemed safe and compliant by the Secretary of State then the systems may be adopted and approved for use in elections by each county through a majority vote of its qualified electors. 25 PA. CONS. STAT. ANN. Code §§ 3031.5, 3031.2 (West 2008).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://www.votespa.com/HowtoVote/tabid/74/language/en-US/Default.aspx

16.

U.S. Election Assistance Commission

ARIZONA

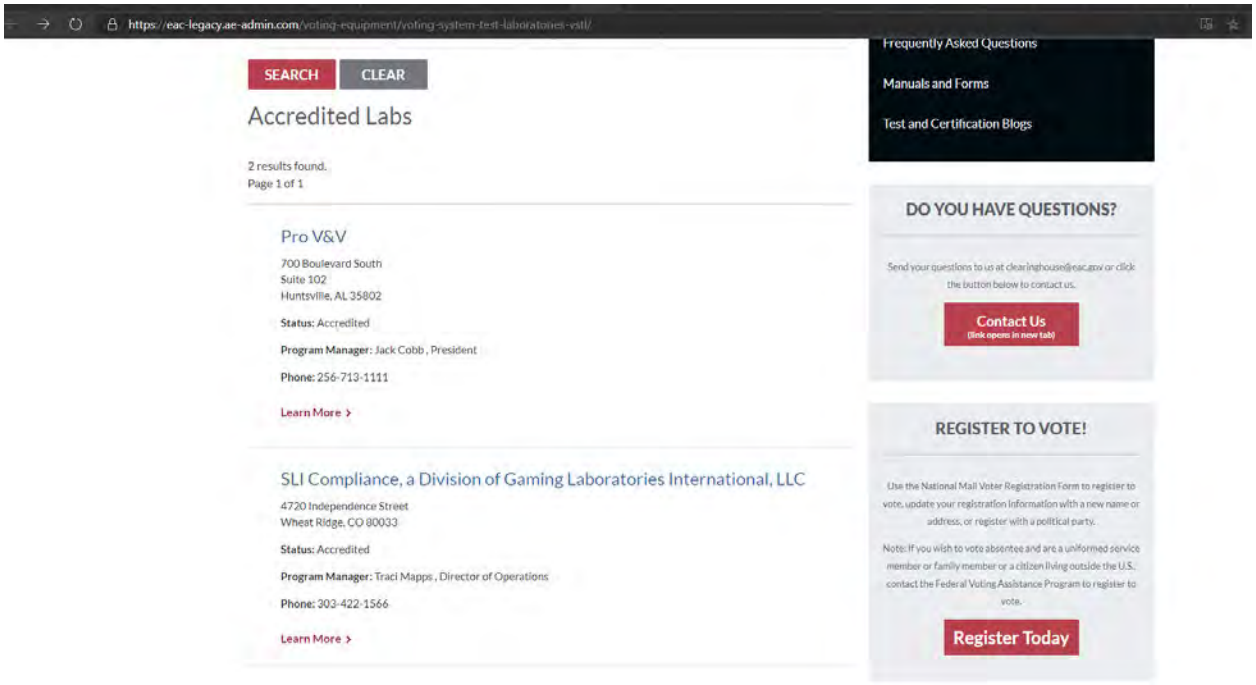
State Participation:	**Requires Testing by a Federally Accredited Laboratory.** AZ requires that its voting systems are HAVA compliant and approved by a laboratory that is accredited pursuant to HAVA.
Applicable Statute(s):	"On completion of acquisition of machines or devices that comply with HAVA, machines or devices used at any election for federal, state or county offices may only be certified for use in this state and may only be used in this state if they comply with HAVA and if those machines or devices have been tested and approved by a laboratory that is accredited pursuant to HAVA." ARIZ. REV. STAT. § 16-442(B) (2008).
Applicable Regulation(s):	AZ does not have a regulation regarding the federal certification process.
State Certification Process:	The Secretary of State appoints a committee of three people that test different voting systems. This committee is required to submit their recommendations to the Secretary of State who then makes the final decision on which voting system(s) to adopt. ARIZ. REV. STAT. § 16-442(A) and (C) (2008).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://www.azsos.gov/election/equipment/default.htm

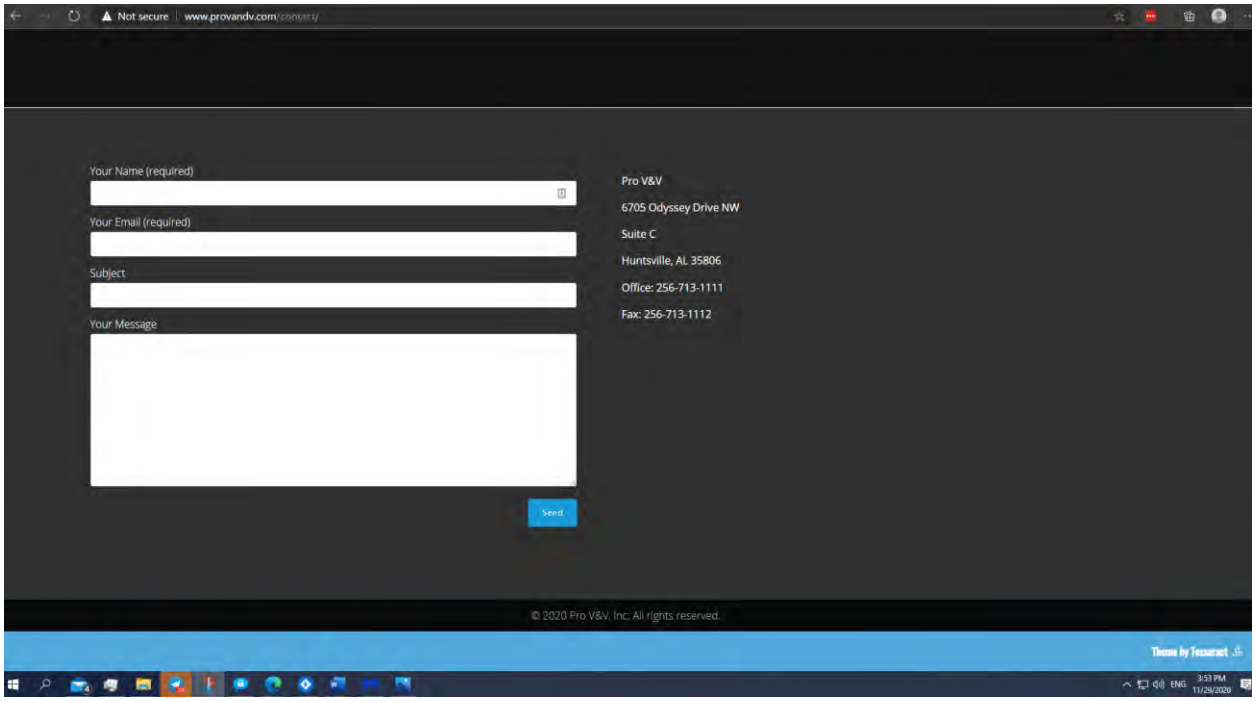
State Participation in EAC Voting System Certification Program 9

17.

18. **Pro V& V** and **SLI Gaming** both lack evidence of EAC Accreditation as per the Voting System Testing and Certification Manual.

19. **Pro V& V** is owned and Operated by Jack Cobb. Real name is Ryan Jackson Cobb. The company ProV&V was founded and run by Jack Cobb who formerly worked under the entity of Wyle Laboratories which is an AEROSPACE DEFENSE CONTRACTING ENTITY. The address information on the EAC, NIST and other entities for Pro V& V are different than that of what is on ProV&V website. The EAC and NIST (ISO CERT) issuers all have another address.





20. VSTLs are the most important component of the election machines as they examine the use of COTS (Commercial Off–The-Shelf)
21. "Wyle became involved with the testing of electronic voting systems in the early 1990's and has tested over 150 separate voting systems. Wyle was the first company to obtain accreditation by the National Association of State Election Directors (NASED). Wyle is accredited by the Election Assistance Commission (EAC) as a Voting System Testing Laboratory (VSTL). Our scope of accreditation as a VSTL encompasses all aspects of the hardware and software of a voting machine. Wyle also received NVLAP accreditation to ISO/IEC 17025:2005 from NIST." Testimony of Jack Cobb 2009
22. COTS are preferred by many because they have been tried and tested in the open market and are most economic and readily available. COTS are also the SOURCE of vulnerability therefore VSTLs are VERY important. COTS components by voting system machine manufacturers can be used as a "Black Box" and changes to their specs and hardware make up change continuously. Some changes can be simple upgrades to make them more efficient in operation, cost efficient for production, end of life (EOL) and even complete reworks to meet new standards. They key issue in this is that MOST of the COTS used by Election Machine Vendors like Dominion, ES&S, Hart Intercivic, Smartmatic and others is that such manufacturing for COTS have been outsourced to China which if implemented in our Election Machines make us vulnerable to BLACK BOX antics and backdoors due to hardware changes that can go undetected. This is why VSTL's are VERY important.
23. The proprietary voting system software is done so and created with cost efficiency in mind and therefore relies on 3rd party software that is AVAILABLE and HOUSED on the HARDWARE. This is a vulnerability. Exporting system reporting using software like Crystal Reports, or PDF software allows for vulnerabilities with their constant updates.
24. As per the COTS hardware components that are fixed, and origin may be cloaked under proprietary information a major vulnerability exists since once again third-party support software is dynamic and requires FREQUENT updates. The hardware components of the computer components, and election machines that are COTS may have slight updates that can be overlooked as they may be like those designed that support the other third -party software. COTS origin is important and the US Intelligence Community report in 2018 verifies that.
25. The Trump Administration made it clear that there is an absence of a major U.S. alternative to foreign suppliers of networking equipment. This highlights the growing dominance of

Chinese manufacturers like Huawei that are the world's LARGEST supplier of telecom and other equipment that endangers national security.

26. China, is not the only nation involved in COTS provided to election machines or the networking but so is Germany via a LAOS founded Chinese linked cloud service company that works with SCYTL named Akamai Technologies that have offices in China and are linked to the server that Dominion Software.

27. 
28. L3 Level Communications is federal contractor that is partially owned by foreign lobbyist George Soros. An article that AP ran in 2010 – spoke out about the controversy of this that has been removed. (LINK) "As for the company's other political connections, it also appears that none other than George Soros, the billionaire funder of the country's liberal political infrastructure, owns 11,300 shares of OSI Systems Inc., the company that owns Rapiscan. Not surprisingly, OSI's stock has appreciated considerably over the course of the year. Soros certainly is a savvy investor." Washington Examiner re-write.

34. “Scytl was selected by the Federal Voting Assistance Program of the U.S. Department of Defense to provide a secure online ballot delivery and onscreen marking systems under a program to support overseas military and civilian voters for the 2010 election cycle and beyond. Scytl was awarded 9 of the 20 States that agreed to participate in the program (New York, Washington, Missouri, Nebraska, Kansas, New Mexico, South Carolina, Mississippi and Indiana), making it the provider with the highest number of participating States.” PDF
35. According to DOMINION : 1.4.1Software and Firmware The software and firmware employed by Dominion D-Suite 5.5-Aconsists of 2 types, custom and commercial off the shelf (COTS). COTS applications were verified to be pristine or were subjected to source code review for analysis of any modifications and verification of meeting the pertinent standards.
36. The concern is the HARDWARE and the NON – ACCREDITED VSTLs as by their own admittance use COTS.
37. The purpose of VSTL’s being accredited and their importance in ensuring that there is no foreign interference/ bad actors accessing the tally data via backdoors in equipment software. The core software used by ALL SCYTL related Election Machine/Software manufacturers ensures “anonymity” .
38. Algorithms within the area of this “shuffling” to maintain anonymity allows for setting values to achieve a desired goal under the guise of “encryption” in the trap-door.
39. The actual use of trapdoor commitments in Bayer-Groth proofs demonstrate the implications for the verifiability factor. This means that no one can SEE what is going on during the process of the “shuffling” therefore even if you deploy an algorithms or manual scripts to fractionalize or distribute pooled votes to achieve the outcome you wish – you cannot prove they are doing it! See STUDY : “The use of trapdoor commitments in Bayer-Groth proofs and the implications for the verifiability of the Scytl-SwissPost Internet voting system”
40. **Key Terms**
41. **UNIVERSAL VERIFIABILITY**: Votes cast are the votes counted and integrity of the vote is verifiable (the vote was tallied for the candidate selected) . **SCYTL FAILS UNIVERSAL VERIFIABILITY** because no mathematical proofs can determine if any votes have been manipulated.
42. **INDIVIDUAL VERIFIABILITY**: Voter cannot verify if their ballot got correctly counted. Like, if they cast a vote for ABC they want to verify it was ABC. That notion clearly discounts the need for anonymity in the first place.

43. To understand what I observed during the 2020 I will walk you through the process of one ballot cast by a voter.
44. STEP 1 |Config Data | All non e-voting data is sent to Scytl (offshore) for configuration of data. All e-voting is sent to CONFIGURATION OF DATA then back to the e-voting machine and then to the next phase called CLEANSING. **CONCERNS**: Here we see an "OR PROOF" as coined by mathematicians – an "or proof" is that votes that have been pre-tallied parked in the system and the algorithm then goes back to set the outcome it is set for and seeks to make adjustments if there is a partial pivot present causing it to fail demanding manual changes such as block allocation and narrowing of parameters or self-adjusts to ensure the predetermined outcome is achieved.
45. STEP 2|CLEANSING | The Process is when all the votes come in from the software run by Dominion and get "cleansed" and put into 2 categories: invalid votes and valid votes.
46. STEP 3|Shuffling /Mixing | This step is the most nefarious and exactly where the issues arise and carry over into the decryption phase. Simply put, the software takes all the votes, literally mixes them a and then re-encrypts them. This is where if ONE had the commitment key- TRAPDOOR KEY – one would be able to see the parameters of the algorithm deployed as the votes go into this mixing phase, and how algorithm redistributes the votes.
47. This published PAPER FROM University College London depicts how this shuffle works. In essence, when this mixing/shuffling occurs, then one doesn't have the ability to know that vote coming out on the other end is actually their vote; therefore, ZERO integrity of the votes when mixed.

48.

Background - ElGamal encryption

- Setup: Group $\mathcal{G}$ of prime order q with generator g
- Public key: $pk = y = g^x$
- Encryption: $\mathcal{E}_{pk}(m; r) = (g^r, y^r m)$
- Decryption: $\mathcal{D}_x(u, v) = vu^{-x}$
- Homomorphic:

$$\mathcal{E}_{pk}(m; r) \times \mathcal{E}_{pk}(M; R) = \mathcal{E}_{pk}(mM; r + R)$$

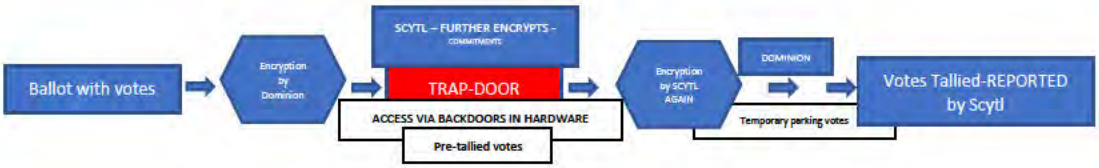
- Re-encryption:

$$\mathcal{E}_{pk}(m; r) \times \mathcal{E}_{pk}(1; R) = \mathcal{E}_{pk}(m; r + R)$$

UCL

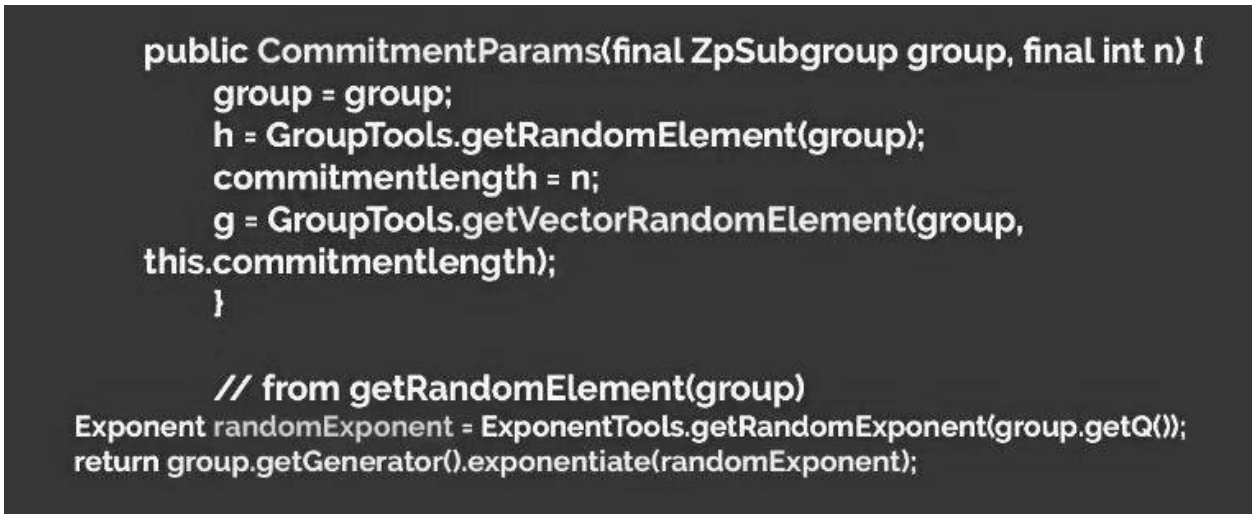
49. When this mixing/shuffling occurs, then one doesn't have the ability to know that vote coming out on the other end is actually their vote; therefore, ZERO integrity of the votes.
50. When the votes are sent to Scytl via Dominion Software EMS (Election Management System) the Trap Door is accessed by Scytl or TRAP DOOR keys (Commitment Parameters).

51.



52. The encrypted data is shifted into Scytl's platform in the form of ciphertexts – this means it is encrypted and a key based on commitments is needed to read the data. The ballot data can only be read if the person has a key that is set on commitments.
53. A false sense of security is provided to both parties that votes are not being "REPLACED" during the mixing phase. Basically, Scytl re-encrypts the ballot data that comes in from Dominion (or any other voting software company) as ciphertexts. Scytl is supposed to prove that votes A, B, C are indeed X, Y, Z under their new re-encryption when sending back the votes that are tallied coding them respectively. This is done by Scytl and the Election Software company that agrees to certain

"Generators" and therefore together build "commitments."



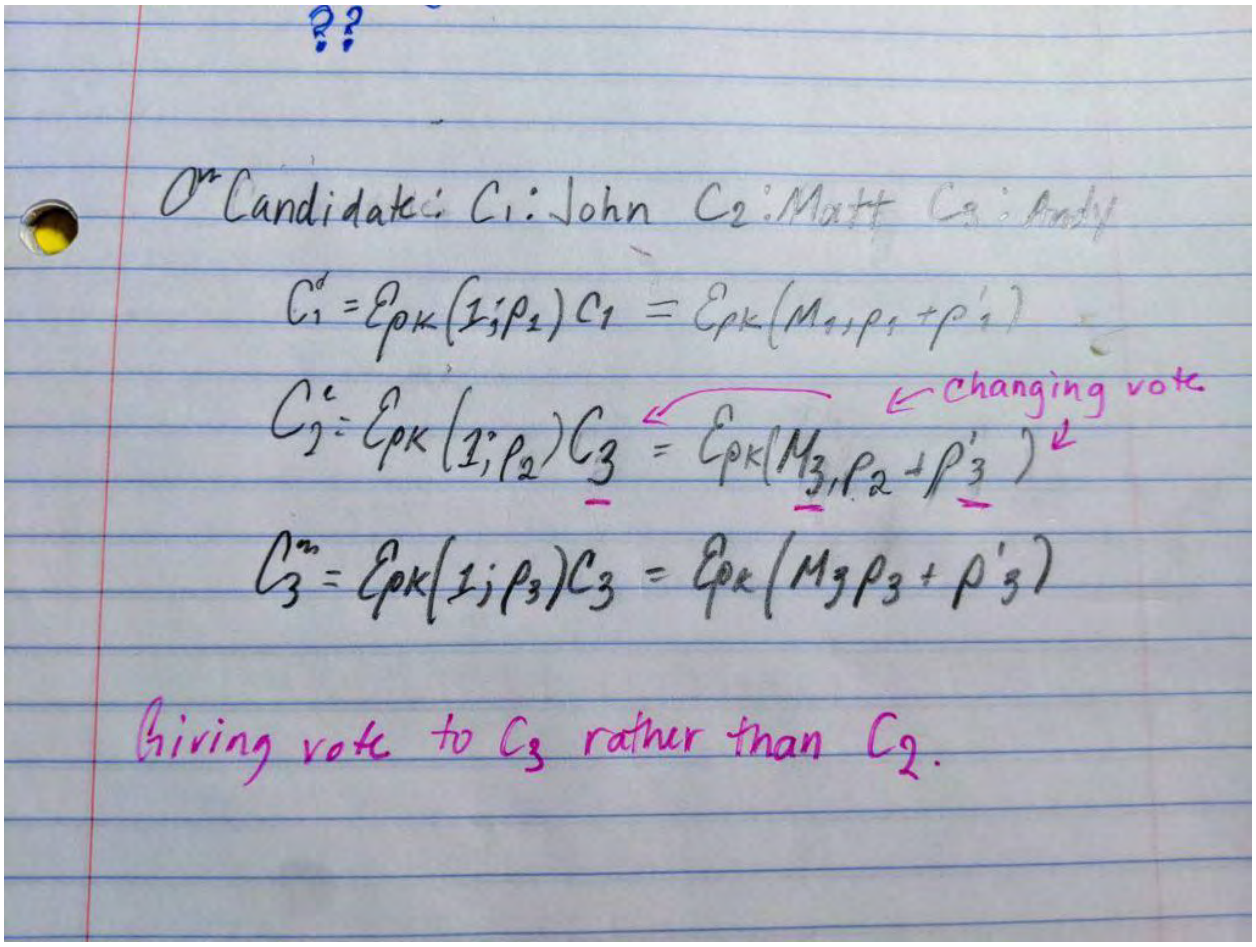
```
public CommitmentParams(final ZpSubgroup group, final int n) {
        group = group;
        h = GroupTools.getRandomElement(group);
        commitmentlength = n;
        g = GroupTools.getVectorRandomElement(group,
this.commitmentlength);
        }

        // from getRandomElement(group)
Exponent randomExponent = ExponentTools.getRandomExponent(group.getQ());
return group.getGenerator().exponentiate(randomExponent);
```

54. Scytl and Dominion have an agreement – only the two would know the parameters. This means that access is able to occur through backdoors in hardware if the parameters of the commitments are known in order to alter the range of the algorithm deployed to satisfy the outcome sought in the case of algorithm failure.
55. Trapdoor is a cryptotech term that describes a state of a program that knows the commitment parameters and therefore is able change the value of the commitments however it likes. In other words, Scytl or anyone that knows the commitment parameters can take all the votes and give them to any one they want. If they have a total of 1000 votes an algorithm can distribute them among all races as it deems necessary to achieve the goals it wants. (Case Study: Estonia)

56. 
57. Within the trapdoor this is how the algorithm behaves to move the goal posts in elections without being detected by this proof . During the mixing phase this is the algorithm you would use to

"reallocate" votes via an algorithm to achieve the goal set.



58. STEP 4|Decryption would be the decryption phase and temporary parking of vote tallies before reporting. In this final phase before public release the tallies are released from encrypted format into plain text. As previously explained, those that know the trapdoor can easily change any votes that the randomness is applied and used to generate the tally vote ciphertext. Thus in this case, Scytl who is the mixer can collude with their vote company clients or an agency (-------) to change votes and get away with it. This is because the receiver doesn't have the decryption key so they rely solely on Scytl to be ***honest*** or free from any foreign actors within their backdoor or the Election Company (like Dominion) that can have access to the key.
59. In fact, a study from the University of Bristol made claim that interference can be seen when there is a GREAT DELAY in reporting and finalizing numbers University of Bristol : How not to Prove Yourself: Pitfalls of the Fiat-Shamir Heuristic and Applications to Helios
60. "Zero-knowledge proofs of knowledge allow a prover to convince a verifier that she holds information satisfying some desirable properties without revealing anything else." David Bernhard, Olivier Pereira,and Bogdan Warinschi.

61. Hence, you can't prove anyone manipulated anything. The TRAP DOOR KEY HOLDERS can offer you enough to verify to you what you need to see without revealing anything and once again indicating the inability to detect manipulation. **ZERO PROOF of INTEGRITY OF THE VOTE.**
62. Therefore, if decryption is challenged, the administrator or software company that knows the trap door key can provide you proof that would be able to pass verification (blind). This was proven to be factually true in the case study by The University of Melbourne in March. White Hat Hackers purposely altered votes by knowing the parameters set in the commitments and there was no way to prove they did it – or any way to prove they didn't.
63. IT'S THE PERFECT THREE CARD MONTY. That's just how perfect it is. They fake a proof of ciphertexts with KNOWN "RANDOMNESS" .This rolls back to the integrity of the VOTE. The vote is not safe using these machines not only because of the method used for ballot "cleansing" to maintain anonymity but the EXPOSURE to foreign interference and possible domestic bad actors.
64. In many circumstances, manipulation of the algorithm is NOT possible in an undetectable fashion. This is because it is one point heavy. Observing the elections in 2020 confirm the deployment of an algorithm due to the BEHAVIOR which is indicative of an algorithm in play that had no pivoting parameters applied.
65. The behavior of the algorithm is that one point (B) is the greatest point within the allocated set. It is the greatest number within the A B points given. Point A would be the smallest. Any points outside the A B points are not necessarily factored in yet can still be applied.
66. The points outside the parameters can be utilized to a certain to degree such as in block allocation.
67. The algorithm geographically changed the parameters of the algorithm to force blue votes and ostracize red.
68. Post block allocation of votes the two points of the algorithm were narrowed ensuring a BIDEN win hence the observation of NO Trump Votes and some BIDEN votes for a period of time.

69. ARIZONA
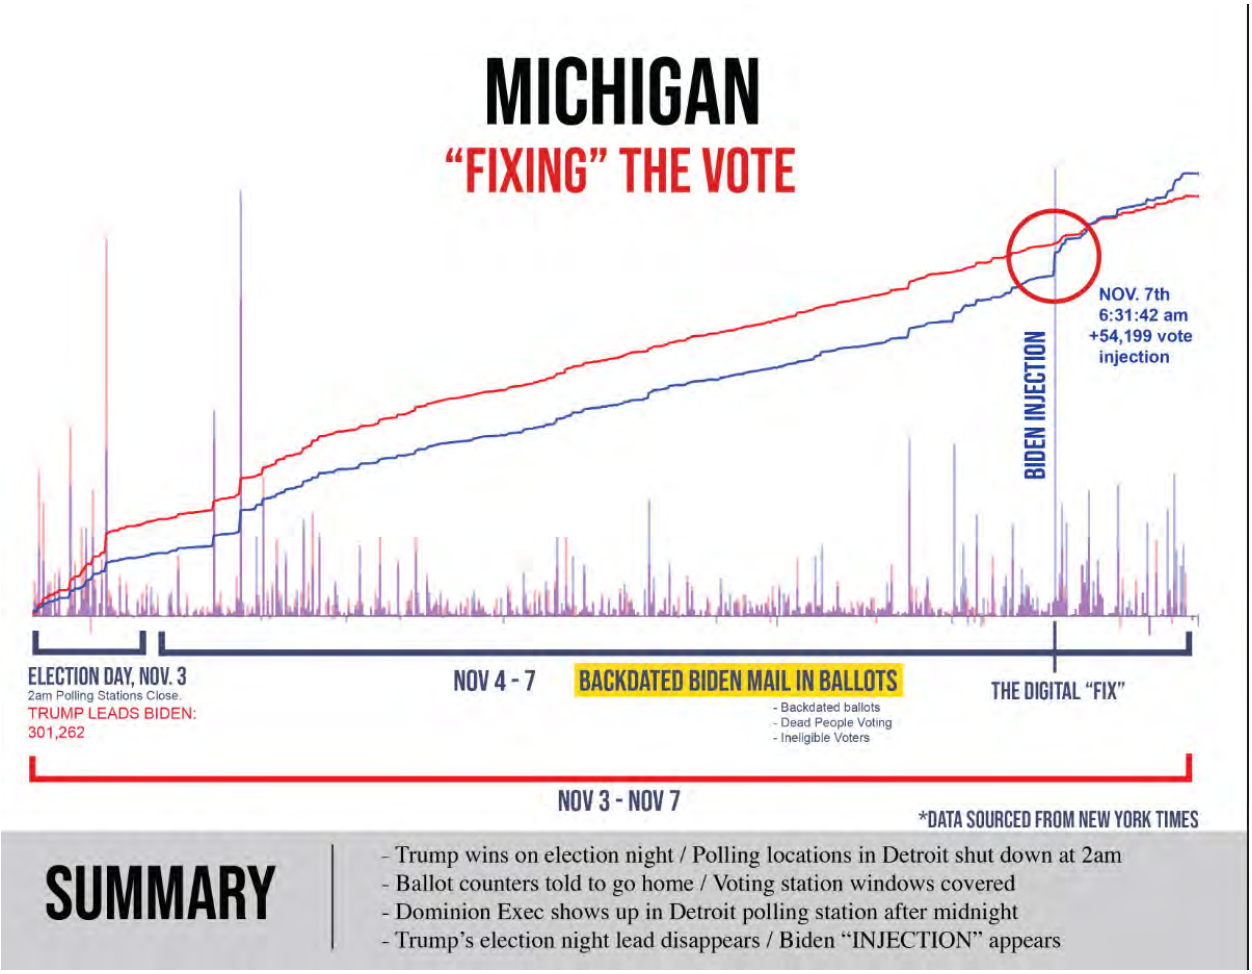
"FIXING" THE VOTE
BIDEN INJECTION
Nov. 3rd
8:06:40 pm
+143,100 votes
(Maricopa & Pima)
NUMBER OF VOTES PROCESSED & THE TIME AT WHICH THEY PROCESSED
ELECTION DAY
NOV 4 - 10
NOV 3 - NOV 10
*DATA SOURCED FROM NEW YORK TIMES
SUMMARY
- Mathematical evidence of the seeding "injection" of votes at the beginning
- A spike means that a large number of votes were injected into the totals
- A normal vote pattern would look like a natural progression – smooth without extreme jumps

70. Gaussian Elimination without pivoting explains how the algorithm would behave and the election results and data from Michigan confirm FAILURE of algorithm.



71. The "Digital Fix" observed with an increased spike in VOTES for Joe Biden can be determined as evidence of a pivot. Normally it would be assumed that the algorithm had a Complete Pivot. Wilkinson's demonstrated the guarantee as :

$$\frac{\|U\|_\infty}{\|A\|_\infty} \leq n^{\frac{1}{2}\log(n)}$$

72.

73. Such a conjecture allows the growth factor the ability to be upper bound by values closer to n. Therefore, complete pivoting can't be observed because there would be too many floating points. Nor can partial as the partial pivoting would overwhelm after the "injection" of votes. Therefore, external factors were used which is evident from the "DIGITAL FIX"

74. Observing the elections, after a review of Michigan's data a spike of 54,199 votes to Biden. Because it is pushing and pulling and keeping a short distance between the 2 candidates; but then a spike, which is how an algorithm presents; - and this spike means there was a pause and an insert was made, where they insert an algorithm. Block spikes in votes for JOE BIDEN were NOT paper

ballots being fed or THUMB DRIVES. The algorithm block adjusted itself and the PEOPLE were creating the evidence to BACK UP the block allocation.

75. I have witnessed the same behavior of the election software in countries outside of the United States and within the United States. In -------, the elections conducted behaved in the same manner by allocating BLOCK votes to the candidate "chosen" to win.
76. Observing the data of the contested states (and others) the algorithm deployed is identical to that which was deployed in 2012 providing Barack Hussein Obama a block allocation to win the 2012 Presidential Elections.
77. The algorithm looks to have been set to give Joe Biden a 52% win even with an initial 50K+ vote block allocation was provided initially as tallying began (as in case of Arizona too). In the am of November 4, 2020 the algorithm stopped working, therefore another "block allocation" to remedy the failure of the algorithm. This was done manually as ALL the SYSTEMS shut down NATIONWIDE to avoid detection.
78. 
79. In Georgia during the 2016 Presidential Elections a failed attempt to deploy the scripts to block allocate votes from a centralized location where the "trap-door" key lay an attempt by someone using

the DHS servers was detected by the state of GA. The GA leadership assumed that it was "Russians" but later they found out that the IP address was that of DHS.

80. In the state of Wisconsin, we observed a considerable BLOCK vote allocation by the algorithm at the SAME TIME it happened across the nation. All systems shut down at around the same time.

81. 
82. In Wisconsin there are also irregularities in respect to BALLOT requests. (names AND address Hidden for privacy)

85. I can personally attest that in 2013 discussions by the Obama / Biden administration were being had with various agencies in the deployment of such election software to be deployed in ----- in 2013.
86. On or about April 2013 a one year plan was set to fund and usher elections in -----.
87. Joe Biden was designated by Barack Hussein Obama to ensure the ----- accepted assistance.
88. John Owen Brennan and James (Jim) Clapper were responsible for the ushering of the intelligence surrounding the elections in -----.
89. Under the guise of Crisis support the US Federal Tax Payers funded the deployment of the election software and machines in ------ signing on with Scytl.

FACT SHEET: U.S. Crisis Support Package for Ukraine

President Obama and Vice President Biden have made U.S. support for Ukraine an urgent priority as the Ukrainian government works to establish security and stability, pursue democratic elections and constitutional reform, revive its economy, and ensure government institutions are transparent and accountable to the Ukrainian people. Ukraine embarks on this reform path in the face of severe challenges to its sovereignty and territorial integrity, which we are working to address together with Ukraine and our partners in the international community. The United States is committed to ensuring that Ukrainians alone are able to determine their country's future without intimidation or coercion from outside forces. To support Ukraine, we are today announcing a new package of assistance totaling **$50 million** to help Ukraine pursue political and economic reform and strengthen the partnership between the United States and Ukraine.

90.

91. Right before the ----- elections it was alleged that CyberBerkut a pro-Russia group infiltrated --- central election computers and **deleted key files**. These actions supposedly rendered the vote-tallying system inoperable.
92. In fact, the KEY FILES were the Commitment keys to allow Scytl to tally the votes rather than the election machines. The group had disclosed emails and other documents proving that their election was rigged and that they tried to avoid a fixed election.
93. The elections were held on May 25, 2014 but in the early AM hours the election results were BLOCKED and the final tally was DELAYED flipping the election in favor of -----.
94. The claim was that there was a DDoS attack by Russians when in actual fact it was a mitigation of the algorithm to inject block votes as we observed was done for Joe Biden because the KEYS were unable to be deployed. In the case of -----, the trap-door key was "altered"/deleted/ rendered ineffective. In the case of the US elections, representatives of Dominion/ ES&S/ Smartmatic/ Hart Intercivic would have to manually deploy them since if the entry points into the systems seemed to have failed.
95. The vote tallying of all states NATIONWIDE stalled and hung for days – as in the case of Alaska that has about 300K registered voters but was stuck at 56% reporting for almost a week.
96. This "hanging" indicates a failed deployment of the scripts to block allocate remotely from one location as observed in ------ on May 26, 2014.
97. This would justify the presence of the election machine software representatives making physical appearances in the states where the election results are currently being contested.
98. A Dominion Executive appeared at the polling center in Detroit after midnight.
99. Considering that the hardware of the machines has NOT been examined in Michigan since 2017 by Pro V& V according to Michigan's own reporting. COTS are an avenue that hackers and bad actors seek to penetrate in order to control operations. Their software updates are the reason vulnerabilities to foreign interference in all operations exist.
100. The importance of VSTLs in underrated to protect up from foreign interference by way of open access via COTS software. Pro V& V who's EAC certification EXPIRED on 24 FEB 2017 was contracted with the state of WISCONSIN.
101. In the United States each state is tasked to conduct and IV& V (Independent Verification and Validation) to provide assurance of the integrity of the votes.
102. If the "accredited" non-federal entities have NOT received EAC accreditation this is a failure of the states to uphold their own states standards that are federally regulated.
103. In addition, if the entities had NIST certificates they are NOT sufficing according the HAVA ACT 2002 as the role of NIST is clear.
104. Curiously, both companies PRO V&V and SLI GAMING received NIST certifications OUTSIDE the 24 month scope.

105. PRO V& V received a NIST certification on 26MAR2020 for ONE YEAR. Normally the NIST certification is good for two years to align with that of EAC certification that is good for two years.

106.

NVLAP®

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 200978-0

Pro V&V
Huntsville, AL

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Voting System Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).

2020-03-26 through 2021-03-31
Effective Dates

DEPARTMENT OF COMMERCE * UNITED STATES OF AMERICA

For the National Voluntary Laboratory Accreditation Program

107. The last PRO V& V EAC accreditation certificate (Item 8) of this declaration expired in February 2017 which means that the IV & V conducted by Michigan claiming that they were accredited is false.

108. The significance of VSTLs being accredited and examining the HARDWARE is key. COTS software updates are the avenues of entry.

109. As per DOMINION'S own petition, the modems they use are COTS therefore failure to have an accredited VSTL examine the hardware for points of entry by their software is key.

*Compact Flash Cards	***SanDisk Ultra: SDCFHS-004G SDCFHS-008G RiData: CFC-14A RDF8G-233XMCB2-1 RDF16G-233XMCB2-1 RDF32G-233XMCB2-1 SanDisk Extreme: SDCFX-016G SDCFX-032G SanDisk: SDFAA-008G		Memory device for ICP and ICE tabulators.
*Modems	Verizon USB Modem Pantech UMW190NCD USB Modem MultiTech MT9234MU CellGo Cellular Modem E-Device 3GPUSUS AT&T USB Modem MultiTech GSM MTD-H5 Fax Modem US Robotics 56K V.92.		Analog and wireless modems for transmitting unofficial election night results.

110.

111. For example and update of Verizon USB Modem Pantech undergoes multiple software updates a year for it's hardware. That is most likely the point of entry into the systems.

112. During the 2014 elections in ---- it was the modems that gave access to the systems where the commitment keys were deleted.

113. SLI Gaming is the other VSTL "accredited" by the EAC BUT there is no record of their accreditation. In fact, SLI was NIST ISO Certified 27 days before the election which means that PA IV&V was conducted without NIST cert for SLI being valid.

115. In fact SLI was NIST ISO Certified for less than 90 days.

116. I can personally attest that high-level officials of the Obama/Biden administration and large private contracting firms met with a software company called GEMS which is ultimately the software ALL election machines run now running under the flag of DOMINION.

117. GEMS was manifested from SOE software purchased by SCYTL developers and US Federally Funded persons to develop it.

118. The only way GEMS can be deployed across ALL machines is IF all counties across the nation are housed under the same server networks.

119. GEMS was tasked in 2009 to a contractor in Tampa, Fl.

120. GEMS was also fine-tuned in Latvia, Belarus, Serbia and Spain to be localized for EU deployment as observed during the Swissport election debacle.

121. John McCain's campaign assisted in FUNDING the development of GEMS web monitoring via WEB Services with 3EDC and Dynology.

122.

123.

124. AKAMAI Technologies services SCYTL.

125. AKAMAI Technologies Houses ALL foreign government sites. (Please see White Paper by Akamai.)

126. AKAMAI Technologies houses ALL .gov state sites. (ref Item 123 Wisconsin.gov Example)

127. 

128. Wisconsin has EDGE GATEWAY port which is AKAMAI TECHNOLOGIES based out of GERMANY.

129. Using AKAMAI Technologies is allowing .gov sites to obfuscate and mask their systems by way of HURRICANE ELECTRIC (he.net) Kicking it to anonymous (AKAMAI Technologies) offshore servers.

130. 
131. AKAMAI Technologies has locations around the world.

132. AKAMAI Technologies has locations in China (ref item 22)

133. AKAMAI Technologies has locations in Iran as of 2019.

134. AKAMAI Technologies merged with UNICOM (CHINESE TELECOMM) in 2018.

135. AKAMAI Technologies house all state .gov information in GERMANY via TELIA AB.

136. In my professional opinion, this affidavit presents unambiguous evidence:

137. That there was Foreign interference, complicit behavior by the previous administrations from 1999 up until today to hinder the voice of the people and US persons knowingly and willingly colluding with foreign powers to steer our 2020 elections that can be named in a classified setting.

138. Foreign interference is present in the 2020 election in various means namely,

139. Foreign nationals assisted in the creation of GEMS (Dominion Software Foundation)

140. Akamai Technologies merged with a Chinese company that makes the COTS components of the election machines providing access to our electronic voting machines.

141. Foreign investments and interests in the creation of the GEMS software.

142. US persons holding an office and private individuals knowingly and willingly oversaw fail safes to secure our elections.

143. The EAC failed to abide by standards set in HAVA ACT 2002.

144. The IG of the EAC failed to address complaints since their appointment regarding vote integrity

145. Christy McCormick of the EAC failed to ensure that EAC conducted their duties as set forth by HAVA ACT 2002

146. Both Patricia Layfield (IG of EAC) and Christy McCormick (Chairwoman of EAC) were appointed by Barack Hussein Obama and have maintained their positions since then.

147. The EAC failed to have a quorum for over a calendar year leading to the inability to meet the standards of the EAC.

148. AKAMAI Technologies and Hurricane Electric raise serious concerns for NATSEC due to their ties with foreign hostile nations.

149. For all the reasons above a complete failure of duty to provide safe and just elections are observed.

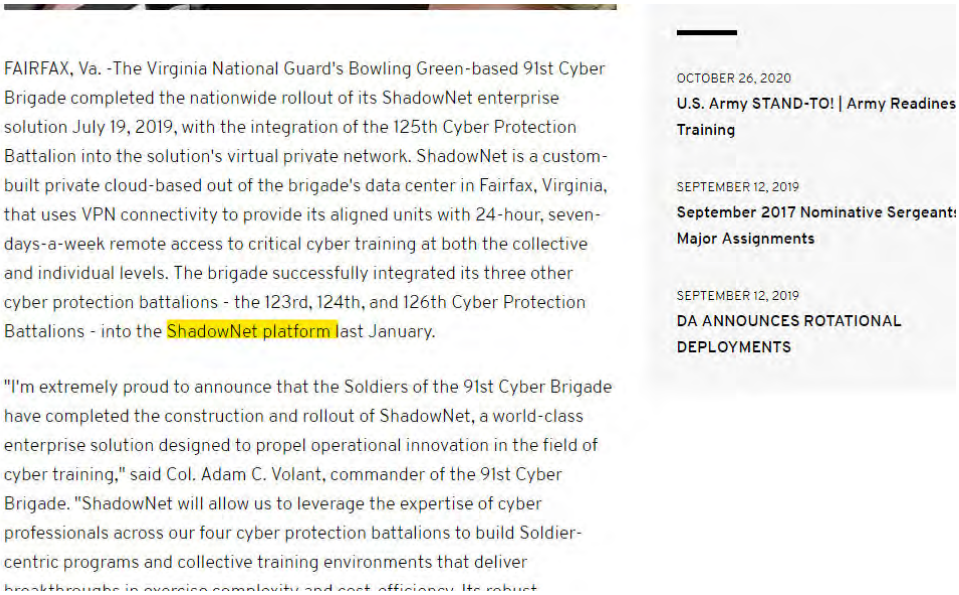
150. For the people of the United States to have confidence in their elections our cybersecurity standards should not be in the hands of foreign nations.

151. Those responsible within the Intelligence Community directly and indirectly by way of procurement of services should be held accountable for assisting in the development, implementation and promotion of GEMS.

152. GEMS ------- General Hayden.

153. In my opinion and from the data and events I have observed ---------- with the assistance of SHADOWNET under the guise of L3-Communications which is MPRI. This is also confirmed by us.army.mil making the statement that shadownet has been deployed to 30 states which all

happen to be using Dominion Machines.



FAIRFAX, Va. -The Virginia National Guard's Bowling Green-based 91st Cyber Brigade completed the nationwide rollout of its ShadowNet enterprise solution July 19, 2019, with the integration of the 125th Cyber Protection Battalion into the solution's virtual private network. ShadowNet is a custom-built private cloud-based out of the brigade's data center in Fairfax, Virginia, that uses VPN connectivity to provide its aligned units with 24-hour, seven-days-a-week remote access to critical cyber training at both the collective and individual levels. The brigade successfully integrated its three other cyber protection battalions - the 123rd, 124th, and 126th Cyber Protection Battalions - into the ShadowNet platform last January.

"I'm extremely proud to announce that the Soldiers of the 91st Cyber Brigade have completed the construction and rollout of ShadowNet, a world-class enterprise solution designed to propel operational innovation in the field of cyber training," said Col. Adam C. Volant, commander of the 91st Cyber Brigade. "ShadowNet will allow us to leverage the expertise of cyber professionals across our four cyber protection battalions to build Soldier-centric programs and collective training environments that deliver

I declare under penalty of perjury that the forgoing is true and correct to the best of my knowledge.
Executed this November 29th, 2020.

DECLARATION OF RONALD WATKINS

I, Ronald Watkins, hereby state the following:

1. My name is Ronald Watkins. I am a United States citizen currently residing in Japan.

2. I am an adult of sound mind. All statements in this declaration are based on my personal knowledge and are true and correct. I am making this statement voluntarily and on my own initiative. I have not been promised, nor do I expect to receive, anything in exchange for my testimony and giving this statement. I have no expectation of any profit or reward and understand that there are those who may seek to harm me for what I say in this statement.

3. I make this declaration because I want to alert the public and let the world know the truth about the insecurity of actual voting tabulation software used in various states for administering the 2020 Presidential and other elections. The software is designed, whether with malicious intent or through plain incompetence, in such a way so as to facilitate digital ballot stuffing via simple vote result manipulation and abuse of the digital adjudication manual review system. Specifically, the Dominion Democracy Suite both enables voter fraud by unethical officials out to undermine the will of the people and facilitates tabulation errors by honest officials making simple, nearly untraceable mistakes.

4. I believe voting is a fundamental manifestation of our right to self-government, including our right to free speech. Under no circumstance should we allow a conspiracy of people and companies to subvert and destroy our most sacred rights.

5. I am a network and information security expert with nine years of experience as a network and information defense analyst and a network security engineer. In my nine years of network and information security experience, I have successfully defended large websites and complex networks against powerful cyberattacks. I have engaged in extensive training and education and learned through experience how to secure websites and networks.

6. In preparation for making this declaration, I have reviewed extensive technical materials relating to the Dominion Voting Democracy Suite, including those cited herein.

7. The Dominion Voting Systems ImageCast Central system is a software and hardware workstation system designed to work with just a common "Windows 10 Pro"[12] computer

tabulates votes in real-time. Information about scanned ballots can be tracked inside the "ImageCast Central" software application.[7]

9. After all of the ballots loaded into the scanner's feed tray have been through the scanner, the "ImageCast Central" operator will remove the ballots from the tray and then will have the option to "Accept Batch" on the scanning menu.[8] Accepting the batch saves the results into the local file system within the "Windows 10 Pro" machine.[9] Any "problem ballots" that may need to be examined or adjudicated at a later time can be found as ballot scans saved as image files into a standard Windows folder named "NotCastImages".[10] These "problem ballots" are automatically detected during the scanning phase and digitally set aside for manual review based on exception criteria.[11] Examples of exceptions may include: overvotes, undervotes, blank contests, blank ballots, write-in selections, and marginal

settings allow for adjustment of the scanning properties to "[set] the clarity levels at which the ballot should be scanned at." Levels can be set as a combination of brightness and contrast values, or as a gamma value."[18]

11. Based on my review of these materials, I conclude the system is designed in such a way that it allows a dishonest or otherwise unethical election administrator to creatively tweak the oval coverage threshold settings and advanced settings on the ImageCast Central scanners to set thresholds in such a way that a non-trivial amount of properly-marked ballots are marked as "problem ballots" and sent to the "NotCastImages" folder.

12. The administrator of the ImageCast Central work-station may view all images of scanned ballots which were deemed "problem ballots" by simply navigating via the standard "Windows File Explorer" to the folder named "NotCastImages" which holds ballot scans of "problem ballots."[1920] Under this system, it is possible for an administrator of the "ImageCast Central" workstation to view and delete any individual ballot scans from the "NotCastImages" folder by simply using the standard Windows delete and recycle bin functions provided by the Windows 10 Pro operating system. Adjudication is "the process of examining voted ballots to determine, and, in the judicial sense, adjudicate voter intent."[21]

[20] Calhoun County, MI, ImageCast Central (ICC) 5.5 Operations, p27, [online document], https://cms5.revize.com/revize/calhouncountymi/Clerk%20&%20Register%20of%20Deeds/local%20clerk%20resources/5_5_icc_operations_manual.pdf (accessed November 23, 2020), https://web.archive.org/web/20200802003507/https://cms5.revize.com/revize/calhouncountymi/Clerk%20&%20Register%20of%20Deeds/local%20clerk%20resources/5_5_icc_operations_manual.pdf [archive].

[21] Dominion Voting, Democracy Suite® Use Procedures, p9, [online document] https://votingsystems.cdn.sos.ca.gov/vendors/dominion/ds510-use-proc-jan.pdf (Accessed November 23, 2020),

13. Based on my review of these materials, I conclude that a biased poll worker without sufficient and honest oversight could abuse the adjudication system to fraudulently switch votes for a specific candidate.

14. After the tabulation process, the ImageCast Central software saves a copy of the tabulation results locally to the "Windows 10 Pro" machine's internal storage. The results data is located in an easy-to-find path which is designed to easily facilitate the uploading of tabulation results to flash memory cards. The upload process is just a simple copying of a "Results" folder containing vote tallies to a flash memory card connected to the "Windows 10 Pro" machine. The copy process uses the standard drag-and-drop or copy/paste mechanisms within "Windows File Explorer."[22] It is my conclusion that while this is a simple procedure, the report results process is subject to user errors and is very vulnerable to corrupt manipulation by a malicious administrator. It is my conclusion that, before delivering final tabulation results to the county, it is possible for an administrator to mistakenly copy the wrong "Results" folder or even maliciously copy a false "Results" folder, which could contain a manipulated data set, to the flash memory card and deliver those false "Results" as the outcome of the election.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed in Japan on November 24, 2020.

Congress of the United States

Washington, DC 20515

October 6, 2006

Henry M. Paulson, Jr.
Secretary
Department of the Treasury
1500 Pennsylvania Ave., N.W.
Washington, D.C. 20220

Dear Mr. Secretary:

I am writing to follow up on my letter of May 4, 2006, to Secretary Snow, seeking review by the Committee on Foreign Investment in the United States of the acquisition of Sequoia Voting Systems by Smartmatic, a foreign-owned company. I believe this transaction raises exactly the sort of foreign ownership issues that CFIUS is best positioned to examine for national security concerns. As discussed below, publicly reported information about Smartmatic's ownership and about the vulnerability of electronic voting machines to tampering raises serious concerns. I strongly urge CFIUS to independently verify the information provided to American officials and the public by Sequoia/Smartmatic, and to take all appropriate measures to safeguard our national security.

It is undisputed that Smartmatic is foreign-owned and it has acquired Sequoia, one of the three major voting machine companies doing business in the U.S. According to a Sequoia press release in May 2006 (copy attached) Sequoia voting machines were used to record over 125 million votes during the 2004 Presidential election in the United States. As we confront another election, Americans deserve to know that the Administration has made sure that any foreign ownership of voting machines poses no national security threat.

Although many press reports have tried, it appears that it is not possible to discern the true owners of Smartmatic from information available to the public. Smartmatic now acknowledges that Antonio Mugica, a Venezuelan businessman, has a controlling interest in Smartmatic, but the company has not revealed who all the other Smartmatic owners are. According to the press, Smartmatic's owners are hidden through a web of off-shore private entities. (See attached articles.)

The opaque nature of Smartmatic's ownership is particularly troubling since Smartmatic has been associated by the press with the Venezuelan government led by Hugo Chavez, which is openly hostile to the United States. According to press reports, Smartmatic shared a founder, officers, directors and a principal place of business with Bizta, a company in which, according to Smartmatic, the Venezuelan government previously held a 28% stake. Mugica is also a director of Bizta.

According to Smartmatic press releases, (copies attached) Smartmatic and Bizta were part of the consortium that received the government contract to provide the voting machines for the 2004 referendum election to recall Chavez as Venezuela's president, and have since been awarded other contracts by the Venezuelan government.

Smartmatic's possible connection to the Venezuelan government poses a potential national security concern in the context of its acquisition of Sequoia because electronic voting machines are susceptible to tampering and insiders are in the best position to engage in such tampering. The 2005 Government Accountability Office Report on electronic voting, GAO-05-956, and other private sector studies consistently support this conclusion. Thus, the reports that Sequoia brought Venezuelan nationals to the United States to work on the Chicago 2006 primary election raises questions about whether these individuals are subject to direction from a foreign interest that might pose a threat to the integrity of the election. Similarly, the use of Smartmatic software and machines developed in Venezuela, such as the HAAT software that was at issue in Chicago, raises questions as to whether this software is susceptible to manipulation by its unknown creators. Reportedly, Smartmatic may soon be introducing into the United States the type of electronic voting machines that were used (with Bizta software) in the controversial 2004 Venezuelan recall election, under the label AVC Edge II Plus.

In reviewing the Smartmatic acquisition of Sequoia, it is important that CFIUS understand the products and services that are of Venezuelan origin and evaluate Smartmatic's ownership to determine who could have influence and control over these and other Sequoia products and services that are in use or intended for use in U.S. elections. In light of Smartmatic's failure fully to answer these questions to date, this issue demands the most thorough independent investigation by CFIUS.

Thank you for your consideration of this letter.

Sincerely,

Carolyn B. Maloney

Carolyn B. Maloney
Member of Congress

Congress of the United States

Washington, DC 20510

December 6, 2019

Sami Mnaymneh
Founder and Co-Chief Executive Officer
H.I.G. Capital, LLC
[redacted]

Tony Tamer
Founder and Co-Chief Executive Officer
H.I.G. Capital, LLC
[redacted]

Dear Messrs. Mnaymneh and Tamer:

We are writing to request information regarding H.I.G. Capital's (H.I.G.) investment in Hart InterCivic Inc. (Hart InterCivic) one of three election technology vendors responsible for developing, manufacturing and maintaining the vast majority of voting machines and software in the United States, and to request information about your firm's structure and finances as it relates to this company.

Some private equity funds operate under a model where they purchase controlling interests in companies and implement drastic cost-cutting measures at the expense of consumers, workers, communities, and taxpayers. Recent examples include Toys "R" Us and Shopko.[1] For that reason, we have concerns about the spread and effect of private equity investment in many sectors of the economy, including the election technology industry—an integral part of our nation's democratic process. We are particularly concerned that secretive and "trouble-plagued companies,"[2] owned by private equity firms and responsible for manufacturing and maintaining voting machines and other election administration equipment, "have long skimped on security in favor of convenience," leaving voting systems across the country "prone to security problems."[3] In light of these concerns, we request that you provide information about your firm, the portfolio

companies in which it has invested, the performance of those investments, and the ownership and financial structure of your funds.

Over the last two decades, the election technology industry has become highly concentrated, with a handful of consolidated vendors controlling the vast majority of the market. In the early 2000s, almost twenty vendors competed in the election technology market.[4] Today, three large vendors—Election Systems & Software, Dominion Voting Systems, and Hart InterCivic—collectively provide voting machines and software that facilitate voting for over 90% of all eligible voters in the United States.[5] Private equity firms reportedly own or control each of these vendors, with very limited "information available in the public domain about their operations and financial performance."[6] While experts estimate that the total revenue for election technology vendors is about $300 million, there is no publicly available information on how much those vendors dedicate to research and development, maintenance of voting systems, or profits and executive compensation.[7]

Concentration in the election technology market and the fact that vendors are often "more seasoned in voting machine and technical services contract negotiations" than local election officials, give these companies incredible power in their negotiations with local and state governments. As a result, jurisdictions are often caught in expensive agreements in which the same vendor both sells or leases, and repairs and maintains voting systems–leaving local officials dependent on the vendor, and the vendor with little incentive to substantially overhaul and improve its products.[8] In fact, the Election Assistance Commission (EAC), the primary federal body responsible for developing voluntary guidance on voting technology standards, advises state and local officials to consider "the cost to purchase or lease, operate, and maintain a voting system over its life span … [and to] know how the vendor(s) plan to be profitable" when signing contracts, because vendors typically make their profits by ensuring "that they will be around to maintain it after the sale." The EAC has warned election officials that "[i]f you do not manage the vendors, they will manage you."[9]

Election security experts have noted for years that our nation's election systems and infrastructure are under serious threat. In January 2017, the U.S. Department of Homeland Security designated the United States' election infrastructure as "critical infrastructure" in order to prioritize the protection of our elections and to more effectively assist state and local election

officials in addressing these risks.[10] However, voting machines are reportedly falling apart across the country, as vendors neglect to innovate and improve important voting systems, putting our elections at avoidable and increased risk.[11] In 2015, election officials in at least 31 states, representing approximately 40 million registered voters, reported that their voting machines needed to be updated, with almost every state "using some machines that are no longer manufactured."[12] Moreover, even when state and local officials work on replacing antiquated machines, many continue to "run on old software that will soon be outdated and more vulnerable to hackers."[13]

In 2018 alone "voters in South Carolina [were] reporting machines that switched their votes after they'd inputted them, scanners [were] rejecting paper ballots in Missouri, and busted machines [were] causing long lines in Indiana."[14] In addition, researchers recently uncovered previously undisclosed vulnerabilities in "nearly three dozen backend election systems in 10 states."[15] And, just this year, after the Democratic candidate's electronic tally showed he received an improbable 164 votes out of 55,000 cast in a Pennsylvania state judicial election in 2019, the county's Republican Chairwoman said, "[n]othing went right on Election Day. Everything went wrong. That's a problem."[16] These problems threaten the integrity of our elections and demonstrate the importance of election systems that are strong, durable, and not vulnerable to attack.

H.I.G. reportedly owns or has had investments in Hart InterCivic, a major election technology vendor. In order to help us understand your firm's role in this sector, we ask that you provide answers to the following questions no later than December 20, 2019.

1. Please provide the disclosure documents and information enumerated in Sections 501 and 503 of the *Stop Wall Street Looting Act*.[17]

2. Which election technology companies, including all affiliates or related entities, does H.I.G. have a stake in or own? Please provide the name of and a brief description of the services each company provides.

Michael McCarthy
Chairman
McCarthy Group, LLC
[redacted]

Dear Mr. McCarthy:

We are writing to request information regarding McCarthy Group, LLC's (McCarthy Group) investment in Election Systems & Software (ES&S), one of three election technology vendors responsible for developing, manufacturing and maintaining the vast majority of voting machines and software in the United States, and to request information about your firm's structure and finances as it relates to this company.

Some private equity funds operate under a model where they purchase controlling interests in companies and implement drastic cost-cutting measures at the expense of consumers, workers, communities, and taxpayers. Recent examples include Toys "R" Us and Shopko.[1] For that reason, we have concerns about the spread and effect of private equity investment in many sectors of the economy, including the election technology industry—an integral part of our nation's democratic process. We are particularly concerned that secretive and "trouble-plagued companies,"[2] owned by private equity firms and responsible for manufacturing and maintaining voting machines and other election administration equipment, "have long skimped on security in favor of convenience," leaving voting systems across the country "prone to security problems."[3] In light of these concerns, we request that you provide information about your firm, the portfolio companies in which it has invested, the performance of those investments, and the ownership and financial structure of your funds.

Over the last two decades, the election technology industry has become highly concentrated, with a handful of consolidated vendors controlling the vast majority of the market. In the early

[2] ProPublica, "The Market for Voting Machines Is Broken. This Company Has Thrived in It.," Jessica Huseman, October 28, 2019, https://www.propublica.org/article/the-market-for-voting-machines-is-broken-this-company-has-thrived-in-it.

[3] Associated Press News, "US Election Integrity Depends on Security-Challenged Firms," Frank Bajak, October 28, 2019, https://apnews.com/f6876669cb6b4e4c9850844f8e015b4c.

2000s, almost twenty vendors competed in the election technology market.[4] Today, three large vendors—ES&S, Dominion Voting Systems, and Hart InterCivic—collectively provide voting machines and software that facilitate voting for over 90% of all eligible voters in the United States.[5] Private equity firms reportedly own or control each of these vendors, with very limited "information available in the public domain about their operations and financial performance."[6] While experts estimate that the total revenue for election technology vendors is about $300 million, there is no publicly available information on how much those vendors dedicate to research and development, maintenance of voting systems, or profits and executive compensation.[7]

Concentration in the election technology market and the fact that vendors are often "more seasoned in voting machine and technical services contract negotiations" than local election officials, give these companies incredible power in their negotiations with local and state governments. As a result, jurisdictions are often caught in expensive agreements in which the same vendor both sells or leases, and repairs and maintains voting systems–leaving local officials dependent on the vendor, and the vendor with little incentive to substantially overhaul and improve its products.[8] In fact, the Election Assistance Commission (EAC), the primary federal body responsible for developing voluntary guidance on voting technology standards, advises state and local officials to consider "the cost to purchase or lease, operate, and maintain a voting system over its life span … [and to] know how the vendor(s) plan to be profitable" when signing contracts, because vendors typically make their profits by ensuring "that they will be around to maintain it after the sale." The EAC has warned election officials that "[i]f you do not manage the vendors, they will manage you."[9]

Election security experts have noted for years that our nation's election systems and infrastructure are under serious threat. In January 2017, the U.S. Department of Homeland Security designated the United States' election infrastructure as "critical infrastructure" in order to prioritize the protection of our elections and to more effectively assist state and local election officials in addressing these risks.[10] However, voting machines are reportedly falling apart across the country, as vendors neglect to innovate and improve important voting systems, putting our

elections at avoidable and increased risk.[11] In 2015, election officials in at least 31 states, representing approximately 40 million registered voters, reported that their voting machines needed to be updated, with almost every state "using some machines that are no longer manufactured."[12] Moreover, even when state and local officials work on replacing antiquated machines, many continue to "run on old software that will soon be outdated and more vulnerable to hackers."[13]

In 2018 alone "voters in South Carolina [were] reporting machines that switched their votes after they'd inputted them, scanners [were] rejecting paper ballots in Missouri, and busted machines [were] causing long lines in Indiana."[14] In addition, researchers recently uncovered previously undisclosed vulnerabilities in "nearly three dozen backend election systems in 10 states."[15] And, just this year, after the Democratic candidate's electronic tally showed he received an improbable 164 votes out of 55,000 cast in a Pennsylvania state judicial election in 2019, the county's Republican Chairwoman said, "[n]othing went right on Election Day. Everything went wrong. That's a problem."[16] These problems threaten the integrity of our elections and demonstrate the importance of election systems that are strong, durable, and not vulnerable to attack.

Member of Congress

Declaration of Russell James Ramsland, Jr.

1. My name is Russell James Ramsland, Jr., and I am a resident of Dallas County, Texas. I make this declaration pursuant to 28 USC sec 1746. I am over 18 years of age. I hold an MBA from Harvard University, and a political science degree from Duke University. I have worked with the National Aeronautics and Space Administration (NASA) and the Massachusetts Institute of Technology (MIT), among other organizations, and have run businesses all over the world, many of which are highly technical in nature. I have served on technical government panels.

2. I am part of the management team of Allied Security Operations Group, LLC, (ASOG). ASOG is a group of globally engaged professionals who come from various disciplines to include Department of Defense, Secret Service, Department of Homeland Security, and the Central Intelligence Agency. It provides a range of security services, but has a particular emphasis on cybersecurity, open source investigation and penetration testing of networks. We employ a wide variety of cyber and cyber forensic analysts. We have patents pending in a variety of applications from novel network security applications to SCADA (Supervisory Control and Data Acquisition) protection and safe browsing solutions for the dark and deep web. For this report, I have relied on these experts and resources.

3. In November 2018, ASOG analyzed audit logs for the central tabulation server of the ES&S Election Management System (EMS) for the Dallas, Texas, General Election of 2018. Our team was surprised at the enormous number of error messages that should not have been there. They numbered in the thousands, and the operator ignored and overrode all of them. This led to various legal challenges in that election, and we provided evidence and analysis in some of them.

4. As a result, ASOG initiated an 18-month study into the major EMS providers in the United States, among which is Election Systems and Software ("ES&S") that provides EMS services for Wisconsin. We did thorough background research of the literature and discovered there is confirmed evidence from both Democrat and Republican stakeholders in the vulnerability of ES&S. Next, we began doing passive penetration testing into the vulnerabilities described in the literature and confirmed for ourselves that in many cases, past vulnerabilities already identified were still left open to exploit in the November 2020 elections. We also noticed a striking similarity between the approach to software and EMS systems of ES&S and Dominion. This was logical since they share a common ancestry in the Diebold voting system.

5. Over the past three decades, almost all of the states have shifted from a relatively low-technology format to a high-technology format that relies heavily on a handful of private services companies. These private companies supply the hardware and software, often handle voter registrations, hold the voter records, partially manage the elections, program counting the votes and report the outcomes. Wisconsin is one of those states.

6. These systems contain a large number of known vulnerabilities to hacking and tampering, both when voters express their voting intention by marking an electronic ballot using ballot marking devices (BMDs), and at the back end where the votes are stored, tabulated, and reported by election officials. These vulnerabilities are well known, and experts in the field have written extensively about them.. This is not surprising as there are no federal standards for security in voting system software. EAC 2.0 was to be written to address this issue, but was never done.

7. Below is a screenshot from the ES&S Security Test Report Electionware 5.2.1.0 – 8/28/17 – Freeman, Craft, McGregor Group. It shows an incredible number of vulnerabilities in the system by which inside and external threats can manipulate the outcomes in a variety of ways.

Recently ES&S moved many of its systems into the cloud behind cloudfare, but ASOG determined that this protection can still be easily circumvented by gaining access through its FTP site ESSVotes.

7. Election Systems and Software ("ES&S") is a privately held company that provides election technologies and services to government jurisdictions. Almost all the counties of Wisconsin use the ES&S Election Management System with the exception of Sheboygan County. ES&S systems have options to be an electronic, paperless voting system with no permanent record of the voter's choices, or a paper ballot-based system or hybrid of those two.

9. The overwhelming vulnerabilities of the ES&S system were on full display in Dallas County where ES&S is used, during the 2020 General Election. Data has been provided by the Dallas County Election Department. The Voter Registration Database was received October 13, 2020 following an Open Records Request by The Dallas Examiner. The Mail-In and Early Voting Rosters were downloaded daily from the County's computers. All Texas counties are required by law to publish daily voting rosters.

10. In that election, the voter records during early voting were captured each day for those voters who cast ballots either in person or by mail-in and catalogued using the hash totals to provide an absolute unique identifier. As required by state law, the Dallas County Elections Department published the Daily Vote Roster for all voters who cast ballots during Absentee and In-Person Early Voting. The Roster contained the VoterID, name, address, type of vote, and various dates associated with every Early-Voting vote cast.

Dallas County claims its source of roster data was the In-Person Electronic Poll Books, and the Absentee Ballot scanners. Dallas County has claimed that entry into the Vote Roster can only be done by a registered Dallas County voter who either appeared In-Person or by Absentee Ballot. The computer that generated the roster was apparently hacked between October 7 and October 30. During that period tens of thousands of vote records were purged, added, or edited from the ES&S generated Vote Roster.

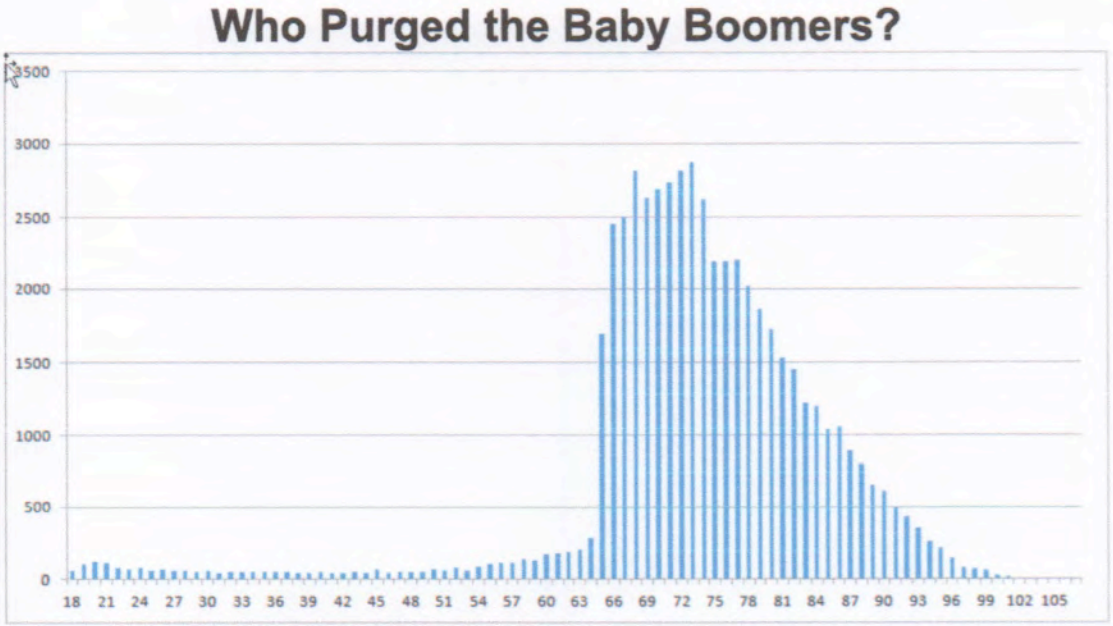
Specifically, over this period, 56,974 voter records had their hash identifier changed, meaning the vote was tampered with after it was cast and recorded in the system. In most cases, this tampering took the form of purging the vote, and then re-constituting it in some form or fashion, but with a change in the hash total meaning the vote was somehow changed. Currently it appears 5,690 votes disappeared completely after voting in person. All in all, this translates into approximately 107,000 hacked votes in Dallas County alone for ES&S. Ten blocks of voters on Westminster Street in Highland Park had their votes purged and then some of them were selectively re-instated at a later date with changes. People who double voted were catalogued as well as dead people who voted, people with no VUID voted (approximately 800 of them), unregistered university students voted, and *people living abroad who claim a Dallas Residence for voting purposes, but who, in a spot check are unknown to the residences they list* in the ES&S system. A short list of them includes:

Country	Voters Who Voted
Mexico	118
Guatemala	9
Nicaragua	4
Kenya	18
Canada	154
Ireland	34
China	62
Australia	105

In plain English, at the instant before a voter casts a ballot there is a one-to-one relationship between the voter and their ballot as well as a one-to-one association between the voter and their votes.

At the instant that ballot is cast, the one-to-one relationship between the voter and ballot still exist, but the relationship between the voter and their votes is gone. No one can know how they voted. The key security check on voting integrity is the absolute match between the number of voters in the Vote Roster and the number of ballots counted in that voting district or precinct. If these numbers do not match, either physical ballots were added or removed from the Ballot Counter or "voters" were added or removed from the Vote Roster. In either case, the election has been compromised and the election is nothing more than a lottery. With tens of thousands of Vote Roster entries purged and other tens of thousand of entries apparently created out of thin air, using the ES&S EMS system, Dallas County Elections Department is definitely in the lottery business.

11. Equally troubling with the ES&S System is the apparent ease of targeting within the system of certain groups for purging. In Dallas, over 92% of PURGED In-Person and Absentee voters were over 65. This is statistically impossible and makes clear the system is easily manipulated by inside or outside actors.



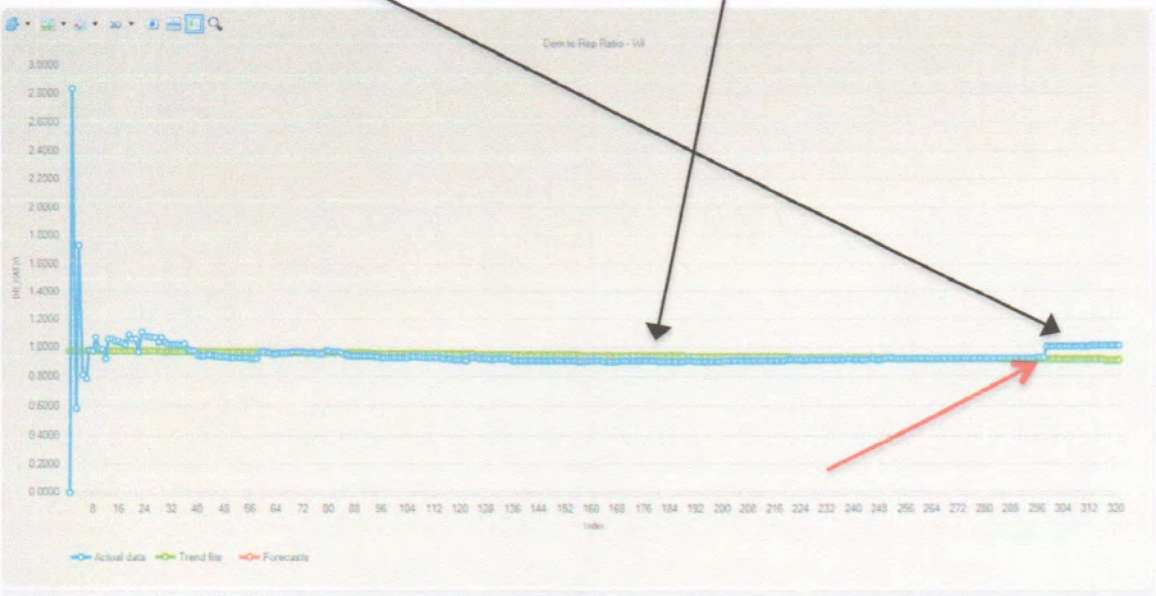
Purged Voters by Age *Source: Dallas County Election Department Vote Rosters Oct 7-Oct 30*

12. My colleagues and I at ASOG have studied the information that is publicly available concerning the November 3, 2020, election results from Wisconsin. Based on the significant anomalies and red flags that we have observed, I believe to a reasonable degree of professional certainty that election results have been

manipulated within the ES&S system in Wisconsin. We list below a few of the red flags that our team has uncovered.

13. Where ES&S is concerned, a statistically unlikely event (red arrow) occurred in the Wisconsin General Election at 09:42:30 Z (3:42 AM local) on 11/4/2020 according to Edison data reported to the NYT. For this analysis we focused on the key ratio of the cumulative Democrat (Biden) votes divided by the cumulative Republican (Trump) votes.

1. A ratio greater than 1.00 is an indicator of Democrat victory
2. A ratio less than 1.00 is an indicator of Republican victory
3. The time series plot shows the trend over time of the cumulative votes.
4. The trend analysis shows the time series but adds a statistically estimated trend line (in green)
5. Where anomalies are observed, the record is pulled out and a proportion test included that tests the probability that that batch of votes was drawn at random from the population of that state, based on the final counts.
6. Randomization is a reasonable assumption because the mail system acts as a randomizer as it mixes the ballots, and the later votes are the mail ballots.
7. The event outline below shifted what had been a settled, unarguable D/R ratio (cumulative to this point) of .912. Suddenly, this event occurs and is of such magnitude it shifts the entire election ratio to 1.0123.



Preview Record

	RECNUM	STATE	TIMESTAMP	VOTES	EEVP	TRUMPD	BIDENJ	TRUMP_CUM	BIDEN_CUM	DATE	TIME	DR_RATIO	D_VOTES	R_VOTES	LOG_D	LOG_R
1	8721	wisconsin	2020-11-04T09:42:20Z	3186598	89	0.490	0.493	1561433	1570993	2020-11-04	09:42:20	1.0061	143379	25163	5.1565	4.4008

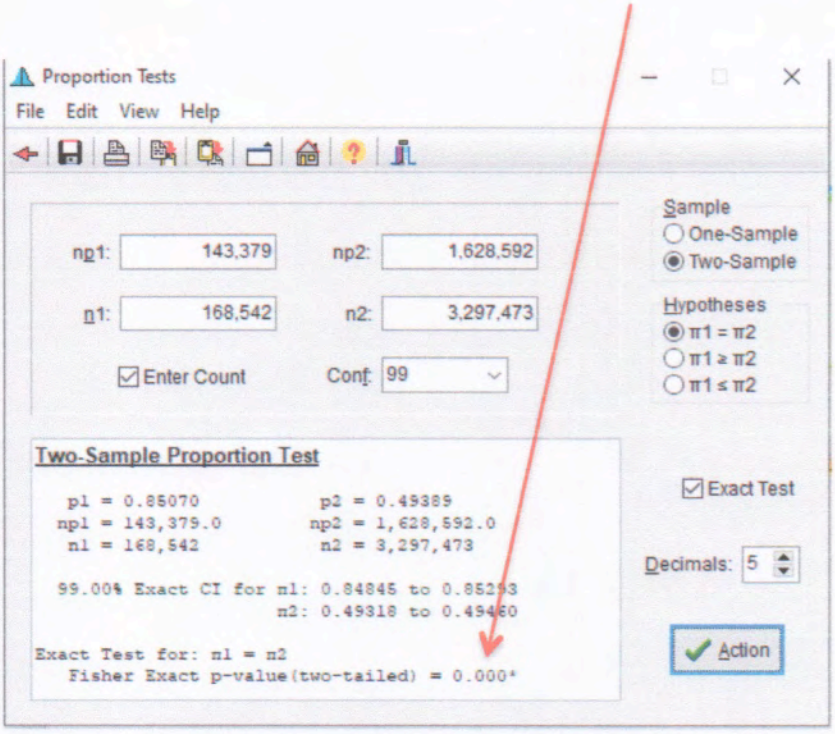
P-Test (two-sample proportion test) shows that there is a 0.0% probability that this vote drop came from a random population of Wisconsin votes as shown in the outcome screenshot below. As shown above, Biden suddenly gets 143,379 votes out of 168,542 or 85%, which itself is outside any percentage before or after.



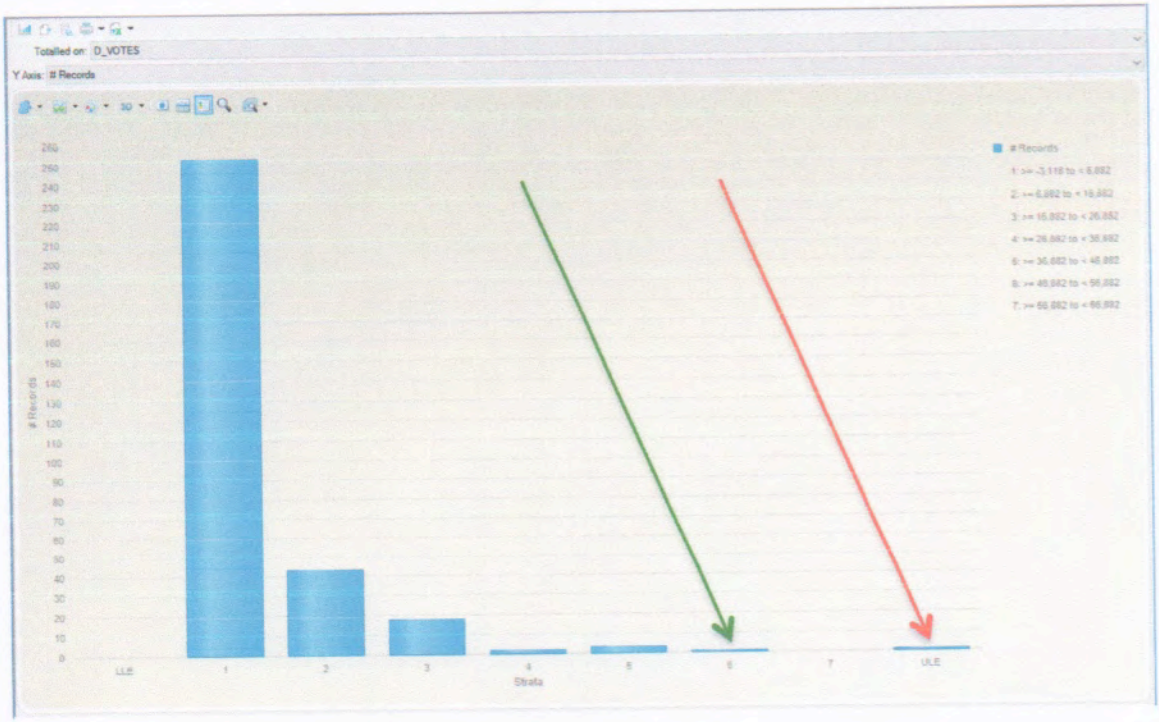
This event changed the final outcome. If this statistically impossible event were removed, the final outcome would be:

Biden:	1,485,573
Trump:	1,584,004

This reveals a shift of approximately 119,430 votes from Biden to Trump would be expected were the election not tampered with.

14. A further red flag is raised when an analysis is done by voting batch. Here we can clearly see the magnitude of the Wisconsin batch dropped at 09:42:30Z on 11/4/2020 vastly exceeds every other Democrat vote total.

This batch shows up as an upper limit exception, meaning it is outside the realm of any expected outcome. A stratification bar chart (below) will indicate visually where the probabilities lie relevant to this event. At 6 standard deviations the chart shows very little chance of this occurring (green arrow). However, in this case, the event occurs at 12.93 standard deviations from the mean (red arrow), showing the probability even smaller at less than 3 in 1,000. Any fraud examiner would instantly flag this for a fraud audit and our Internal Auditor contractor did so immediately.



All of these are clear indications of fraud.

15. Another key red flag appears after inspecting voter turnout figures by county. Out of 72 counties, 69 of them exhibited voter turnout figures higher than 80%, a threshold generally considered to be the maximum expected. An amazing 59 of them were above 90%. When the public data votes were normalized to 80% turnout, the excess votes are at least 384,085 over the maximum that could be expected. A sample of this is shown in the table below.

County	Turnout %
Sheboygan County	270%
Shawano County	195%
Taylor County	95%
Marquette County	95%
Price County	94%

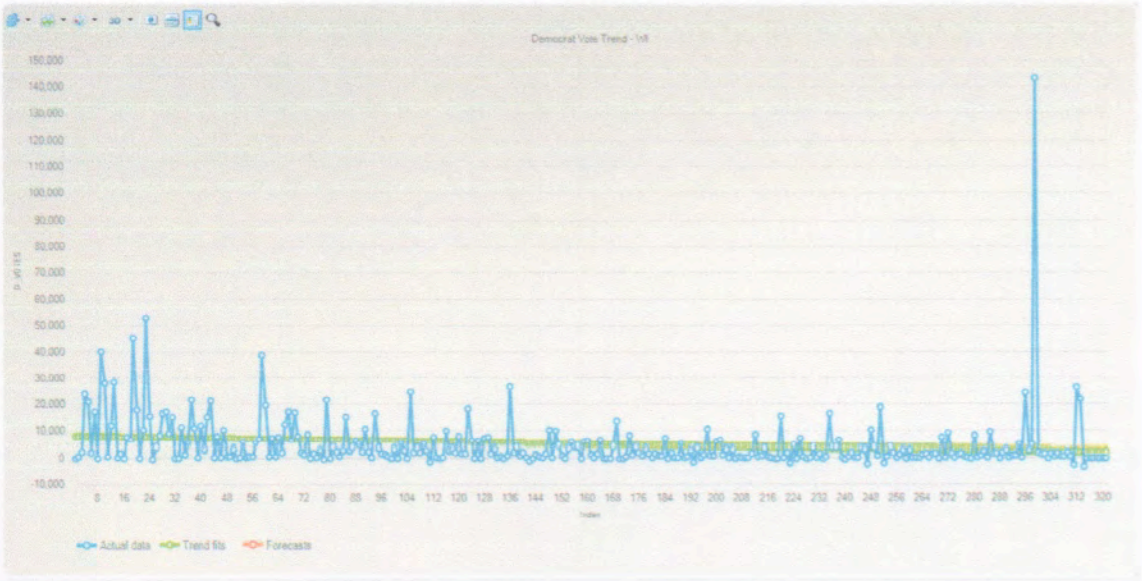
15. Returning to the spike chart presented earlier, a time series crossed with a location specific analysis would determine whether the equipment on hand at any location would have even been capable of processing this many votes in the time represented. In Michigan, we have already observed this phenomenon and the analysis made clear it was physically impossible for the equipment on hand to process this many votes in the time represented.

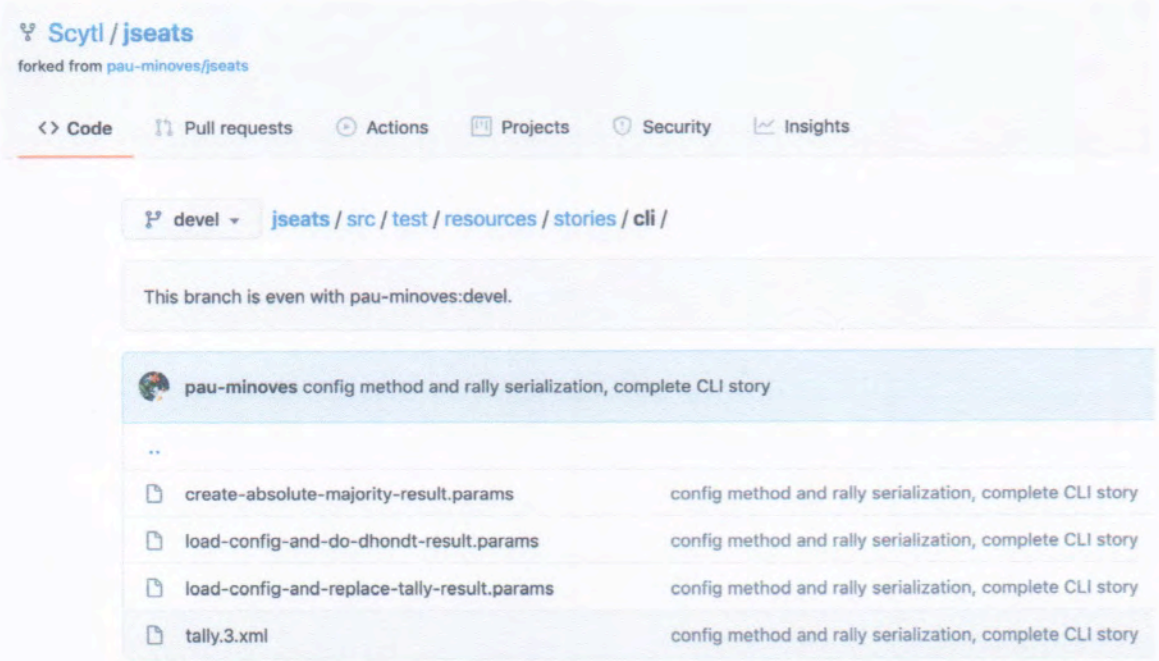


Preview Record

	RECNUM	STATE	TIMESTAMP	VOTES	EEVP	TRUMPD	BIDENJ	TRUMP_CUM	BIDEN_CUM	DATE	TIME	DR_RATIO	D_VOTES	R_VOTES	LOG_D	LOG_R
1	8721	wisconsin	2020-11-04T09:42:20Z	3186598	89	0.490	0.493	1561433	1570993	2020-11-04	09:42:20	1.0061	143379	25163	5.1565	4.4008

This spike, cast largely for Biden, (143,379-Biden, 25,163-Trump) could easily be produced in the ES&S EMS control system by pre-loading batches of blank ballots in files such as Write-Ins or other adjudication-type files then casting them almost all for Biden using the Override Procedure (to cast Write-In, Blank, or Error ballots) that is available to the operator of the system.

16. ES&S uses Scytl via Clarity Elections to accomplish the actual tabulation. Scytl has in its source code the ability to use a common, additive electoral seat allocation algorithm (JSeats) in order to award points based on percentages that are input into the system by the operator in order to determine (or appoint) a winner, as opposed to simply counting votes. Various parameters, weighting percentages, etc. can be set up. Thus, the winner is selected based on "points" that the algorithm computes, not actual voter votes. Below is a screenshot



The fact that we observed raw vote data coming directly that includes decimal places establishes selection by an algorithm, and not individual voter's choice. Otherwise, votes would be solely represented as whole numbers (votes cannot possibly be added up and have decimal places reported). Below is an excerpt from the direct feed to news outlets showing actual calculated votes with decimals.

state	timestamp	eevp	trump	biden	TV	BV

wisconsin	2020-11-04T03:30:52Z	36	0.503	0.481	651861.844	623350.988
wisconsin	2020-11-04T03:35:25Z	37	0.503	0.48	661114.026	630884.16

14. Based on the foregoing, I believe these statistical anomalies and impossibilities compels the conclusion to a reasonable degree of professional certainty that the vote count in Wisconsin, in particular for candidates for President, contain at least 119,430 (Para. 13) up to 384,085 (Para. 15) illegal votes that must be disregarded. In my opinion, it is not possible at this time to determine the true results of the Wisconsin vote for President of the United States.

I declare, under the penalty of perjury, that the forgoing is correct.

Russell James Ramsland, Jr.

JOINT CYBERSECURITY ADVISORY

TLP:WHITE

Product ID: AA20-304A

October 30, 2020

Iranian Advanced Persistent Threat Actor Identified Obtaining Voter Registration Data

SUMMARY

This advisory uses the MITRE Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK®) framework. See the ATT&CK for Enterprise framework for all referenced threat actor techniques.

This joint cybersecurity advisory was coauthored by the Cybersecurity and Infrastructure Security Agency (CISA) and the Federal Bureau of Investigation (FBI). CISA and the FBI are aware of an Iranian advanced persistent threat (APT) actor targeting U.S. state websites—to include election websites. CISA and the FBI assess this actor is responsible for the mass dissemination of voter intimidation emails to U.S. citizens and the dissemination of U.S. election-related disinformation in mid-October 2020.[1] (Reference FBI FLASH message ME-000138-TT, disseminated October 29, 2020). Further evaluation by CISA and the FBI has identified the targeting of U.S. state election websites was an intentional effort to influence and interfere with the 2020 U.S. presidential election.

TECHNICAL DETAILS

Analysis by CISA and the FBI indicates this actor scanned state websites, to include state election websites, between September 20 and September 28, 2020, with the Acunetix vulnerability scanner (*Active Scanning: Vulnerability Scanning* [T1595.002]). Acunetix is a widely used and legitimate web scanner, which has been used by threat actors for nefarious purposes. Organizations that do not regularly use Acunetix should monitor their logs for any activity from the program that originates from IP addresses provided in this advisory and consider it malicious reconnaissance behavior.

Additionally, CISA and the FBI observed this actor attempting to exploit websites to obtain copies of voter registration data between September 29 and October 17, 2020 (*Exploit Public-Facing*

[1] See FBI FLASH, ME-000138-TT, disseminated 10/29/20, https://www.ic3.gov/Media/News/2020/201030.pdf. This disinformation (hereinafter, "the propaganda video") was in the form of a video purporting to misattribute the activity to a U.S. domestic actor and implies that individuals could cast fraudulent ballots, even from overseas. https://www.odni.gov/index.php/newsroom/press-releases/item/2162-dni-john-ratcliffe-s-remarks-at-press-conference-on-election-security.

Application [T1190]). This includes attempted exploitation of known vulnerabilities, directory traversal, Structured Query Language (SQL) injection, web shell uploads, and leveraging unique flaws in websites.

CISA and the FBI can confirm that the actor successfully obtained voter registration data in at least one state. The access of voter registration data appeared to involve the abuse of website misconfigurations and a scripted process using the cURL tool to iterate through voter records. A review of the records that were copied and obtained reveals the information was used in the propaganda video.

CISA and FBI analysis of identified activity against state websites, including state election websites, referenced in this product cannot all be fully attributed to this Iranian APT actor. FBI analysis of the Iranian APT actor's activity has identified targeting of U.S. elections' infrastructure (*Compromise Infrastructure* [T1584]) within a similar timeframe, use of IP addresses and IP ranges – including numerous virtual private network (VPN) service exit nodes – which correlate to this Iran APT actor (*Gather Victim Host Information* [T1592])), and other investigative information.

Reconnaissance

The FBI has information indicating this Iran-based actor attempted to access PDF documents from state voter sites using advanced open-source queries (*Search Open Websites and Domains* [T1539]). The actor demonstrated interest in PDFs hosted on URLs with the words "vote" or "voter" and "registration." The FBI identified queries of URLs for election-related sites.

The FBI also has information indicating the actor researched the following information in a suspected attempt to further their efforts to survey and exploit state election websites.

- YOURLS exploit
- Bypassing ModSecurity Web Application Firewall
- Detecting Web Application Firewalls
- SQLmap tool

Acunetix Scanning

CISA's analysis identified the scanning of multiple entities by the Acunetix Web Vulnerability scanning platform between September 20 and September 28, 2020 (*Active Scanning: Vulnerability Scanning* [T1595.002]).

The actor used the scanner to attempt SQL injection into various fields in `/registration/registration/details` with status codes 404 or 500:

```
/registration/registration/details?addresscity=-1 or 3*2<(0+5+513-513) --

```

Exfiltration

Obtaining Voter Registration Data

Following the review of web server access logs, CISA analysts, in coordination with the FBI, found instances of the cURL and FDM User Agents sending GET requests to a web resource associated with voter registration data. The activity occurred between September 29 and October 17, 2020. Suspected scripted activity submitted several hundred thousand queries iterating through voter

identification values, and retrieving results with varying levels of success [*Gather Victim Identity Information* (T1589)]. A sample of the records identified by the FBI reveals they match information in the aforementioned propaganda video.

Requests

The actor used the following requests.

```
2020-10-17 13:07:51 x.x.x.x GET /x/x voterid=XXXX1 443 - x.x.x.x curl/7.55.1 -
200 0 0 1406
```

```
2020-10-17 13:07:55 x.x.x.x GET /x/x voterid=XXXX2 443 - x.x.x.x curl/7.55.1 - 200 0
0 1390
```

```
2020-10-17 13:07:58 x.x.x.x GET /x/x voterid=XXXX3 443 - x.x.x.x curl/7.55.1 - 200 0
0 1625
```

```
2020-10-17 13:08:00 x.x.x.x GET /x/x voterid=XXXX4 443 - x.x.x.x curl/7.55.1 - 200 0
0 1390
```

Note: incrementing `voterid` values in `cs_uri_query field`

User Agents

CISA and FBI have observed the following user agents.

```
FDM+3.x
```

```
curl/7.55.1
```

- 89.44.201[.]211 (Observed September 30, 2020)

Recommendations

The following list provides recommended self-protection mitigation strategies against cyber techniques used by advanced persistent threat actors:

- Validate input as a method of sanitizing untrusted input submitted by web application users. Validating input can significantly reduce the probability of successful exploitation by providing

protection against security flaws in web applications. The types of attacks possibly prevented include SQL injection, Cross Site Scripting (XSS), and command injection.

- Audit your network for systems using Remote Desktop Protocol (RDP) and other internet-facing services. Disable unnecessary services and install available patches for the services in use. Users may need to work with their technology vendors to confirm that patches will not affect system processes.
- Verify all cloud-based virtual machine instances with a public IP, and avoid using open RDP ports, unless there is a valid need. Place any system with an open RDP port behind a firewall and require users to use a VPN to access it through the firewall.
- Enable strong password requirements and account lockout policies to defend against brute-force attacks.
- Apply multi-factor authentication, when possible.
- Maintain a good information back-up strategy by routinely backing up all critical data and system configuration information on a separate device. Store the backups offline, verify their integrity, and verify the restoration process.
- Enable logging and ensure logging mechanisms capture RDP logins. Keep logs for a minimum of 90 days and review them regularly to detect intrusion attempts.
- When creating cloud-based virtual machines, adhere to the cloud provider's best practices for remote access.
- Ensure third parties that require RDP access follow internal remote access policies.
- Minimize network exposure for all control system devices. Where possible, critical devices should not have RDP enabled.
- Regulate and limit external to internal RDP connections. When external access to internal resources is required, use secure methods, such as a VPNs. However, recognize the security of VPNs matches the security of the connected devices.
- Use security features provided by social media platforms; use strong passwords, change passwords frequently, and use a different password for each social media account.
- See CISA's Tip on Best Practices for Securing Election Systems for more information.

General Mitigations

Keep applications and systems updated and patched

Apply all available software updates and patches and automate this process to the greatest extent possible (e.g., by using an update service provided directly from the vendor). Automating updates and patches is critical because of the speed of threat actors to create new exploits following the release of a patch. These "N-day" exploits can be as damaging as zero-day exploits. Ensure the authenticity and integrity of vendor updates by using signed updates delivered over protected links. Without the rapid and thorough application of patches, threat actors can operate inside a defender's patch cycle.[2]

[2] NSA "NSA'S Top Ten Cybersecurity Mitigation Strategies" https://www.nsa.gov/Portals/70/documents/what-we-do/cybersecurity/professional-resources/csi-nsas-top10-cybersecurity-mitigation-strategies.pdf

Additionally, use tools (e.g., the OWASP Dependency-Check Project tool[3]) to identify the publicly known vulnerabilities in third-party libraries depended upon by the application.

Scan web applications for SQL injection and other common web vulnerabilities

Implement a plan to scan public-facing web servers for common web vulnerabilities (e.g., SQL injection, cross-site scripting) by using a commercial web application vulnerability scanner in combination with a source code scanner.[4] Fixing or patching vulnerabilities after they are identified is especially crucial for networks hosting older web applications. As sites get older, more vulnerabilities are discovered and exposed.

Deploy a web application firewall

Deploy a web application firewall (WAF) to prevent invalid input attacks and other attacks destined for the web application. WAFs are intrusion/detection/prevention devices that inspect each web request made to and from the web application to determine if the request is malicious. Some WAFs install on the host system and others are dedicated devices that sit in front of the web application. WAFs also weaken the effectiveness of automated web vulnerability scanning tools.

Deploy techniques to protect against web shells

Patch web application vulnerabilities or fix configuration weaknesses that allow web shell attacks, and follow guidance on detecting and preventing web shell malware.[5] Malicious cyber actors often deploy web shells—software that can enable remote administration—on a victim's web server. Malicious cyber actors can use web shells to execute arbitrary system commands commonly sent over HTTP or HTTPS. Attackers often create web shells by adding or modifying a file in an existing web application. Web shells provide attackers with persistent access to a compromised network using communications channels disguised to blend in with legitimate traffic. Web shell malware is a long-standing, pervasive threat that continues to evade many security tools.

Use multi-factor authentication for administrator accounts

Prioritize protection for accounts with elevated privileges, remote access, or used on high-value assets.[6] Use physical token-based authentication systems to supplement knowledge-based factors such as passwords and personal identification numbers (PINs).[7] Organizations should migrate away from single-factor authentication, such as password-based systems, which are subject to poor user

choices and more susceptible to credential theft, forgery, and password reuse across multiple systems.

Remediate critical web application security risks

First, identify and remediate critical web application security risks. Next, move on to other less critical vulnerabilities. Follow available guidance on securing web applications.[8,9,10]

How do I respond to unauthorized access to election-related systems?

Implement your security incident response and business continuity plan

It may take time for your organization's IT professionals to isolate and remove threats to your systems and restore normal operations. In the meantime, take steps to maintain your organization's essential functions according to your business continuity plan. Organizations should maintain and regularly test backup plans, disaster recovery plans, and business continuity procedures.

Contact CISA or law enforcement immediately

To report an intrusion and to request incident response resources or technical assistance, contact CISA (Central@cisa.gov or 888-282-0870) or the FBI through a local field office or the FBI's Cyber Division (CyWatch@ic.fbi.gov or 855-292-3937).

Declaration of [redacted] Ph.D

November 30, 2020

Pursuant to 28 U.S.C Section 1746, I, [redacted], make the following declaration.

1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. [redacted] has a Ph.D in Electrical Engineering from the University of California at Davis and a Masters degree in Mathematics from the University of California at Berkeley. I have been employed, for over 28 years, in the signal processing and wireless signal processing domain, with an emphasis on statistical signal processing. I have published numerous journal and conference articles. Additionally, I have held Top Secret and SAP clearances and I am an inventor of nearly 30 patents, one of which has over 1000 citations in the field of MIMO communications (Multiple Input Multiple Output).
3. I reside at [redacted].
4. Given the data sources referenced in this document, I assert that in Georgia, Pennsylvania and the city of Milwaukee, a simple statistical model of vote fraud is a better fit to the sudden jump in Biden vote percentages among absentee ballots received later in the counting process of the 2020 presidential election. It is also a better fit when constrained to a single large Metropolitan area such as Milwaukee..
5. Given the same data sources, I also assert that Milwaukee precincts exhibit statistical anomalies that are not normally present in fair elections.. The fraud model hypothesis in Milwaukee has a posterior probability of 100% to machine precision. This model predicts 105,639 fraudulent Biden ballots in Milwaukee.
6. I assert that the data suggests aberrant statistical anomalies in the vote counts in Michigan, when observed as a function of time.

Signature:

Supporting evidence for the assertions in (4) and 5 is provided in the following pages.

1 Impact of Fraud on the Election

In the analysis that follows, it is possible to obtain rough estimates on how vote fraud could possibly have effected the election. In Georgia, there is evidence that votes were actually switched from Trump to Biden. As many as 51,110 Biden votes were fraudulent and as many as 51,110 votes could be added to Trump. An audit to determine vote switching will be more difficult, since it is likely the Trump ballots have been destroyed in Georgia, based on reports of ballots being shredded there. If instead we presume that Bidens fraudulent votes were simply added to the totals, then we estimate that 104,107 ballots should be removed from Biden's totals.

In Pennsylvania, from just one batch of absentee ballots, approximately 72668 of them are estimated to be fraudulent Biden votes. Our analysis of Milwaukee shows that 105,639 Biden ballots could be fraudulent. Moreover there is evidence of vote switching here, which might give as many as 42365 additional ballots to Trump, and remove the same from Biden.

Michigan yields an estimate of 237,140 fraudulent Biden votes added to the total, using conservative estimates of the Biden percentage among the new ballots.

2 Statistical Model

The simplest statistical model for computing the probabilities for an election outcome is a binomial distribution, which assigns a probability p for a given person within the population to select a candidate. If we assume that each person chooses their candidate independently, then we obtain the Binomial distribution in the form,

$$P(k|N) \equiv {}_NC_k p^k \left(1-p\right)^{N-k}, \tag{1}$$

where $P(k|N)$ is the probability that you observe k votes for a candidate in a population of N voters, and where ${}_NC_k$ is the number of ways to choose k people out of a group of N people.

For larger N, the binomial distribution can be approximated by a Gaussian distribution, which is used in the election fraud analysis in [1]. The chief reason for this is the difficulty of computing $P(k|N)$ for large N and k. However this problem can be overcome by computing the probabilities in the log domain and using the log beta function to compute ${}_NC_k$.

For this analysis it is more useful to compute the probabilities as a function of f the observed fraction of the candidate's votes. In this formulation we have $k = Nf$, and $N - k = N\left(1-f\right)$, and therefore we define the fractional probability as,

$$B_N(f) \equiv {}_NC_{Nf}\, p^{Nf} \left(1-p\right)^{N(1-f)}. \tag{2}$$

2.1 Fraud Model

To model voting fraud we assume a fixed fraction α of votes are given to the cheater. The pool of available voters who actually voted is now $N(1-\alpha)$. The fraction who actually voted for the cheater is given by $f-\alpha$. The probability that the fraction f voters reported for the cheater, with the fraction α stolen, can therefore be written as,

$$C_{N,\alpha}(f) \equiv B_{N(1-\alpha)}(f-\alpha). \tag{3}$$

This is similar to the fraud model used in the election fraud analysis given in [1]. We use the Binomial distribution directly, rather than the Gaussian distribution, since it should be more accurate for small N, k or f.

2.2 Posterior Probability of Fraud Model

A hypothesis test can now be set up between the standard voting statistics of (2) vs the statistics of the fraud model (3). If we use Bayesian inference we can compute an estimate of the posterior probability of the fraud model. This can be written as,

$$P(F|f) = \frac{C_{N,\alpha}(f)p_F}{C_{N,\alpha}(f)p_F + B_N(f)(1-p_F)},$$

where p_F is the prior probability of fraud. In our investigation we assume fraud is unlikely and set $p_F = 0.01$.

3 Analysis of Absentee Ballots in the 2020 Election

For this analysis we extracted data from the all_states_timeseries.csv file, which can be found at the internet url: https://wiki.audittheelection.com/index.php/Datasets. We look at the absentee ballot results near the beginning of the time series and then compare it to the end or the middle of the period, after a sufficient enough ballots were added.

For the models in Section 2 we assign the probability p of a Biden vote using the final data. This assumption is actually more favorable to the cheater. As mentioned earlier we set the prior probability of fraud to $p_F = 0.01$, and the cheating fraction, α, is set to $\alpha = f - p$, where f is the observed Biden fraction in the newly added ballots. This isolates the statistics of the added ballots from the final observed statistics.

We focus on the absentee ballots, because they are dominated by large democratic cities and there is no obvious reason why those statistics should change appreciably over time. Furthermore it should be noted that the start time for this data, mid day Nov. 4., was well after some of the larger absentee ballot dumps occured.

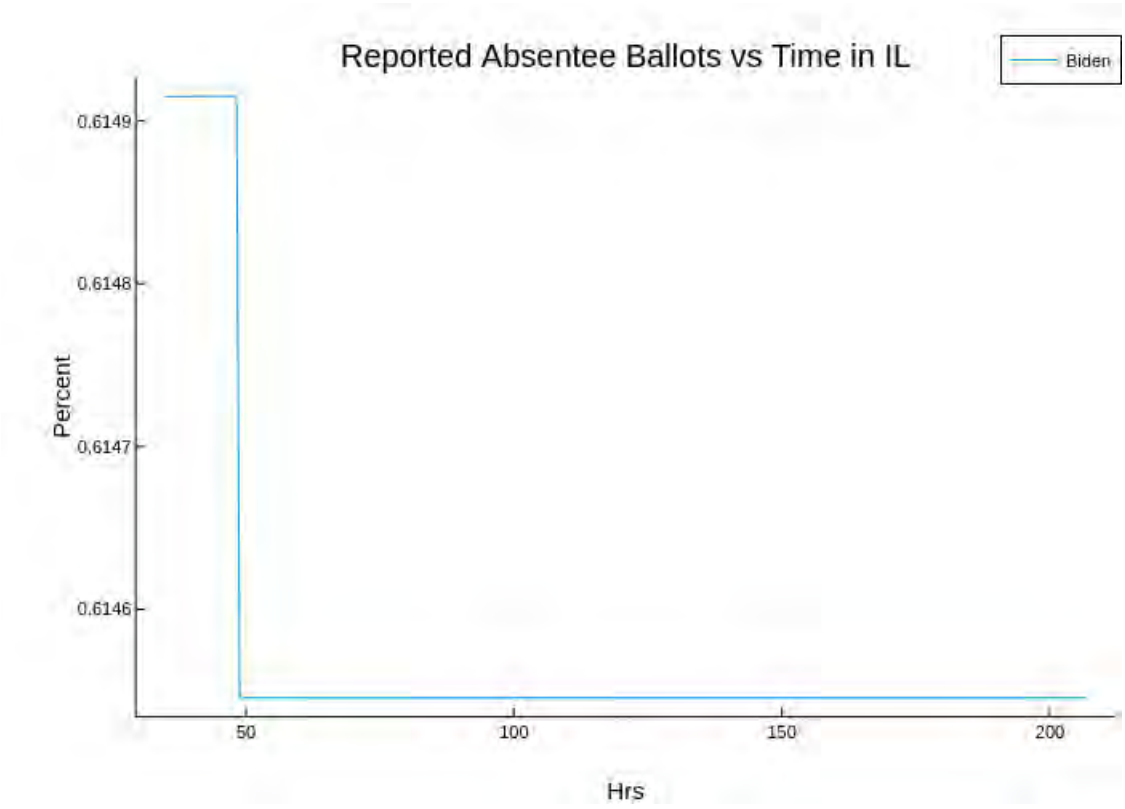

Figure 1: Reported Biden Fraction In Illinois vs Time

3.1 Control Case Illinois

We choose Illinois as a control case, since it has a significant number of absentee ballots that were counted later and provides a fairly clean baseline. The reported Biden fraction vs time is given in Figure 1.

As we can see there is not much change in the Biden statistics from the initial 601,714 absentee ballots when compared with the 54,117 ballots that were added. This is further shown by the bar chart in Figure 2.

Using our formula for the posterior probability of fraud in (3) we obtain the probability that the fraud model is correct of 6.5%. This lends good support to the idea that the Illinois absentee ballots were counted fairly.

3.2 Analysis of Georgia Absentee Ballots

The Georgia absentee ballot count started at 3,701,005 and 303,988 ballots were added. The Biden fraction among absentee ballots as a function of time is shown in Figure (3). This plot shows a statistical abnormality in that the

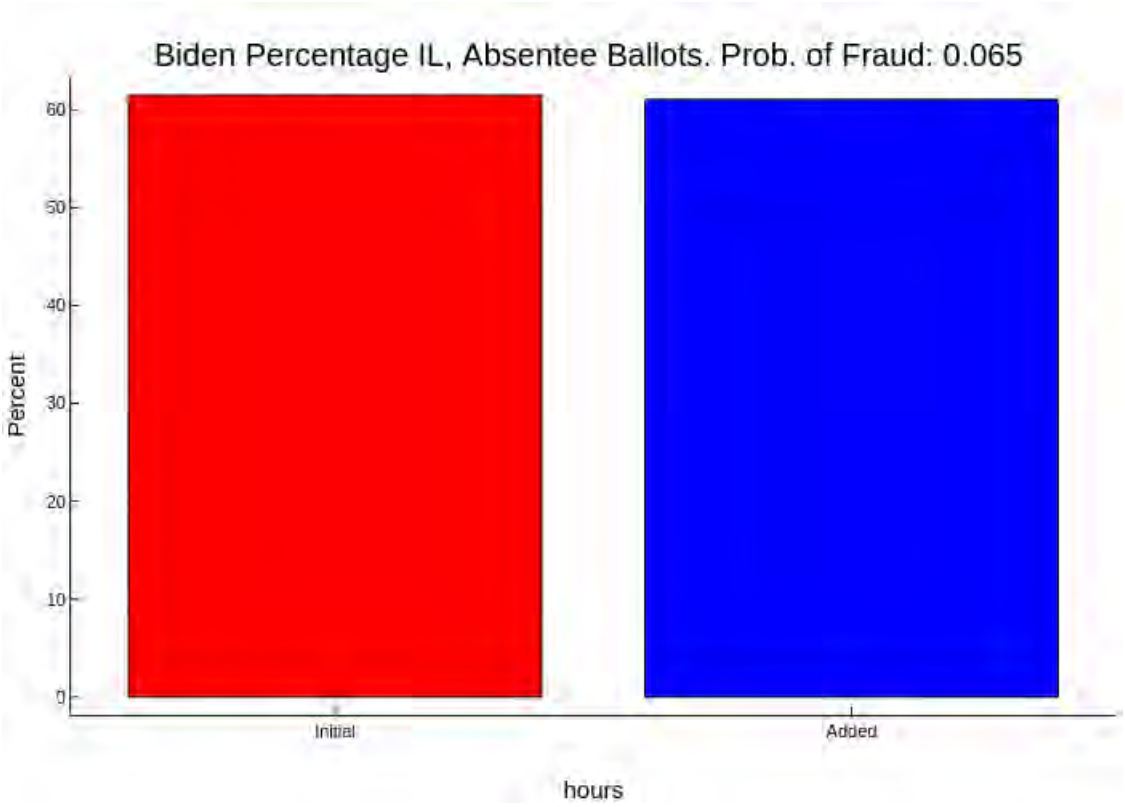

Figure 2: Before and Added Biden Fraction

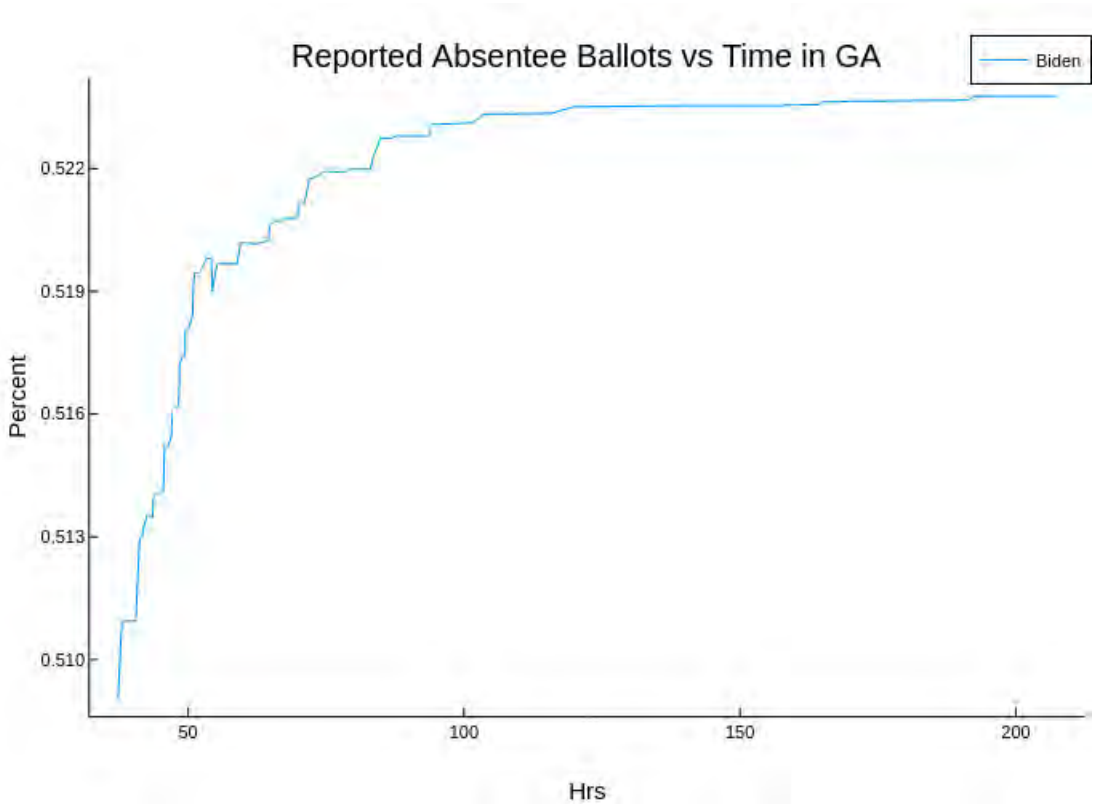

Figure 3: Georgia Absentee Ballots vs Time: (Biden Fraction)

Biden fraction appears to always be increasing. This is statistically unlikely and is not typically seen in fair elections. Normally you would see a mixture of votes of Biden and his opponents, and would see random deviation around the asymptote.

We investigate this phenomenon more fully in Figure (4). The added ballots have a Biden percentage of around 70%, while the initial statitics were at 50%. This is a very large jump for such a large sample size and seems very unlikely. Indeed the probability that the fraud model is correct is 100%, up to the precision of double floating point arithmetic.

Assuming that the prior absentee ballot distribution is the correct one, we can form a simple prediction for how many of Biden's ballots were fraudulent. Let $N_1 = 303,988$, the number of ballots added, and let $B = 189,497$ be the number of Biden votes in this new batch. If the fraction of Biden votes should actually be $f = 0.509$. Let x be the proposed number of fraudulent Biden votes,

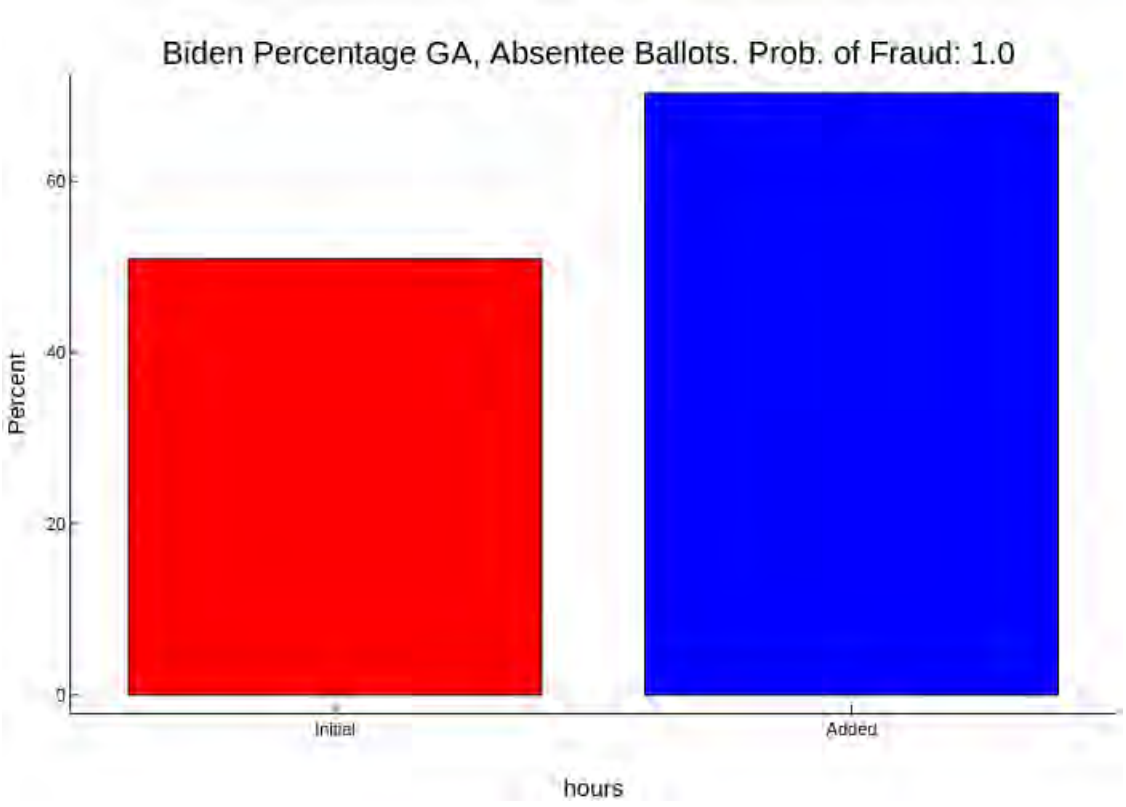

Figure 4: Before and After Biden Fraction in Georgia

then we have,

$$\frac{B-x}{N_1-x} = f$$
$$x = \frac{B-N_1 f}{1-f}. \tag{4}$$

In the case that votes were actually switched from Trump to Biden, then the formula becomes,

$$\frac{B-x}{N_1} = f$$
$$x = B - N_1 f$$

This would suggest that 104,107 ballots were fraudulently manufactured for Biden. If we presume that actually those ballots were switched from Trump to Biden then as many as 19% of the new absentee ballots for Biden were fraudulent, which totals around 51,110 ballots that should be removed from Biden's totals and added to Trump. We shall see in Section 6, that there is substantial evidence that some Trump votes were actually switched to Biden votes.

3.3 Analysis of Pennsylvania Absentee Ballots

The Pennsylvania absentee ballot count started at 785,473 and 319,741 ballots were added at 39 hours after the start of the data record. The Biden fraction among absentee ballots as a function of time is shown in Figure (5). This plot shows some oddities in that the Biden fraction fluctuates with large deviations.

In Figure (6) we see the initial Biden percentage compared with the Biden percentage of the added ballots over the first 39 hours. The added ballots have a Biden percentage of around 83%, while the initial statistics were at 78%. This is a very large jump for such a large sample size and seems very unlikely. Indeed the probability that the fraud model is correct is 100%, up to the precision of double floating point arithmetic.

If we just examine the initial large batch of votes among the absentee ballots, we see an unexplained jump of 5% for Biden. Although it is likely that most of the fraud, if any, occurred earlier in the vote count, just this batch of ballots suggests that approximately 72668 Biden ballots are fraudulent. If we presume that the votes were stolen from Trumps votes, then 15987 Biden ballots are fraudulent and should be added to Trump's total.

4 Analysis of Milwaukee County in Wisconsin

We now switch our analysis to a data set that contains precinct data for Milwaukee county. The data was obtained from the twitter acount of @shylockh, who derived his sources from the New York Times and in some cases from

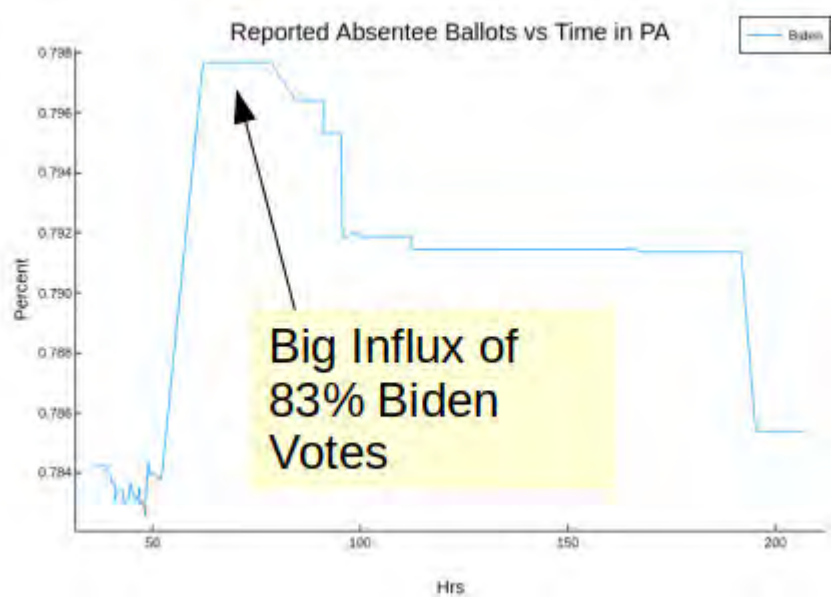

Figure 5: Pennsylvania Absentee Ballots vs Time: (Biden Fraction)

the unofficial precinct reports from the Wisconsin elections commision website. We examine vote percentages for ballots added between Wednesday morning, 11/04/2020 and Thursday night 11/05/2020.

This data set gives the total vote count by party affiliation. Because the data set is confined to Milwaukee, we can assume that the statistics should not be time varying. The voting pool here is highly partisan in favor of democrats and we don't expect any significant difference in the voting percentage, especially since a large number of absentee ballots were already counted by Wednesday morning.

4.1 Analysis of Milwaukee County Democrat results

The percentage of democrat voters increases by 15% among the ballots added on Wednesday and Thursday. On Wednesday morning Milwaukee had received 165,776 ballots. By Thursday evening 458,935 ballots were received, adding 293,159 ballots.

In Figure 7 we see the large deviation in democrat percentage between the Wednesday morning and those added by Thursday evening. This too causes the posterior probability of the fraud model to be 100% to machine precision.

Assuming that there was fraud, we estimate that 105,639 fraudulent Biden ballots were added between Wednesday and Thursday of 11/05/2020 in Milwaukee alone. However as we shall see below, many of these votes may well have been switched from Trump to Biden, which would also give Trump an additional

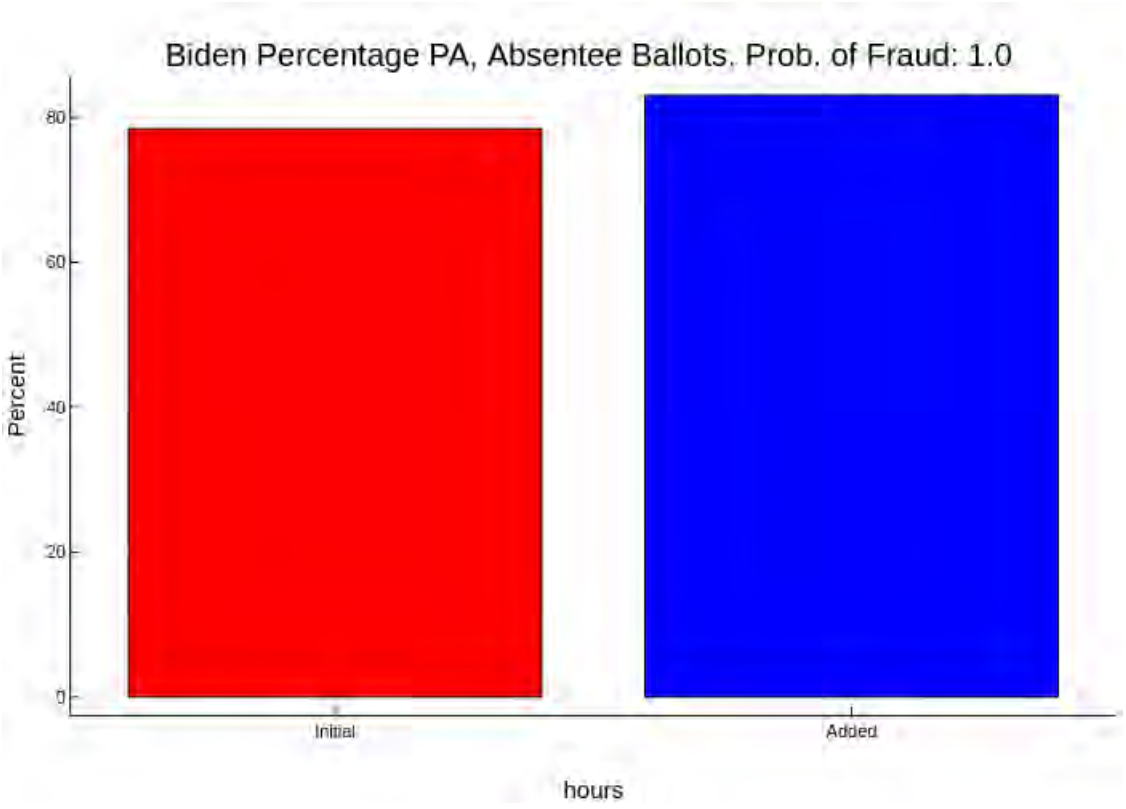

Figure 6: Before and After Biden Fraction in Pennsylvania

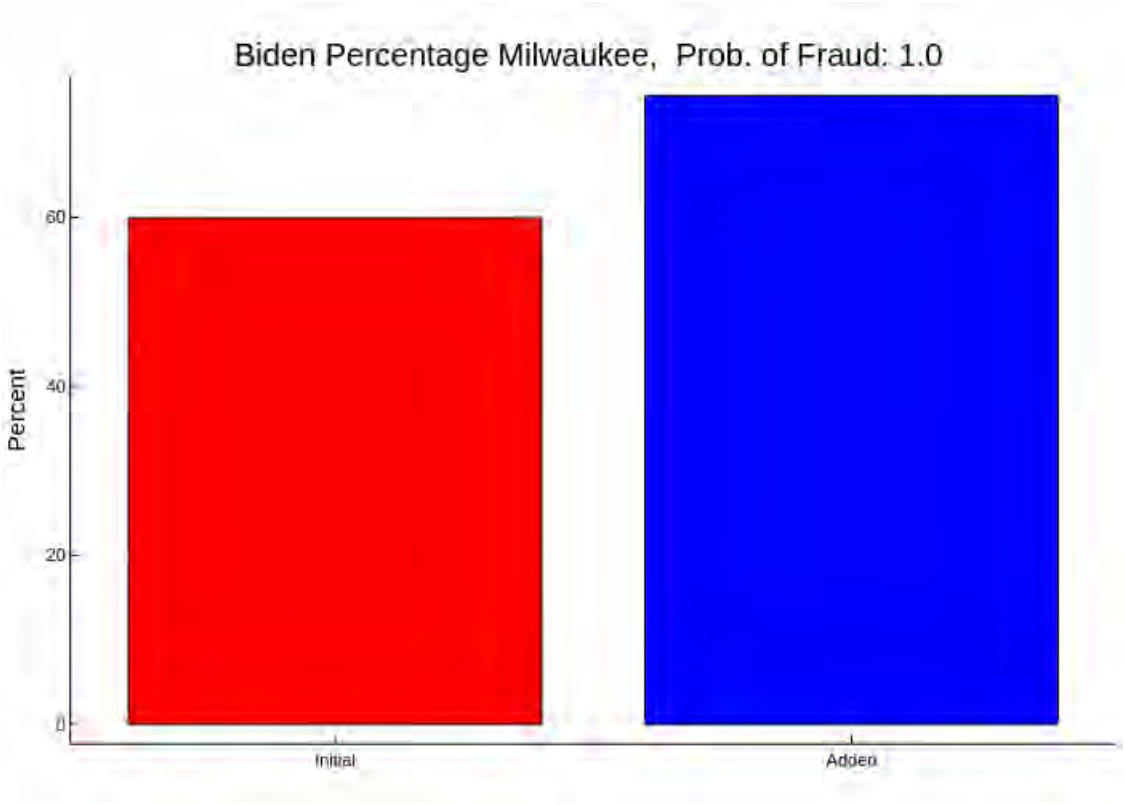

Figure 7: Before and After Democrat Fraction in Milwaukee

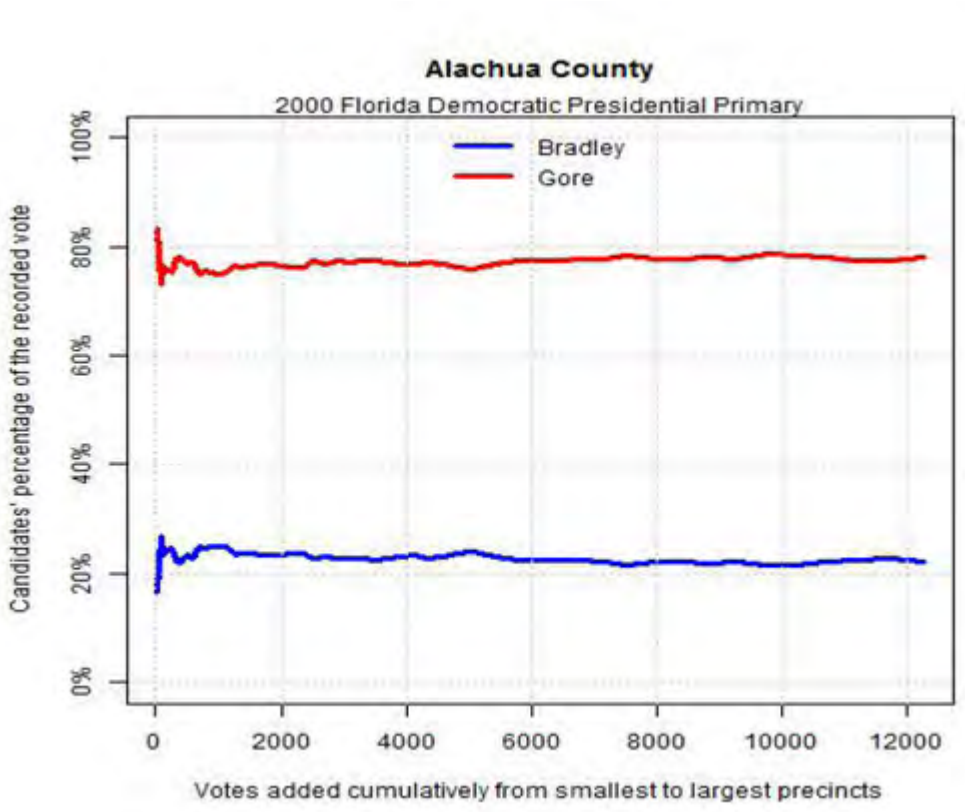

Figure 8: Baseline Cumulative Fractions Sorted by Precinct Size

42365 votes and remove 42365 votes from Biden.

4.2 Candidate Percentages Sorted by Ward Size

Another useful tool for evaluating fraud is to look at the cumulative vote percentages sorted by an independent input factor. An easy factor to use is ward or precinct size. This concept was used throughout the report on voter irregularities in [2]. In that report there was an anomalous dependency on precinct size in many of the 2016 primary elections. The larger precincts had introduced the use of voting machines. But one could also theorize the opportunity for cheaters to cheat in small precincts, where there may be less oversight.

Normally we would expect the cumulative vote percentage to converge to an asymptote, and bounce around the mean until convergence. An example of this can be found from the 2000 Florida Democratic presidential primary between Gore and Bradley. This is shown in Figure 8, and is taken from [2].

However when one sorts the Milwaukee, Thursday night data, by precinct

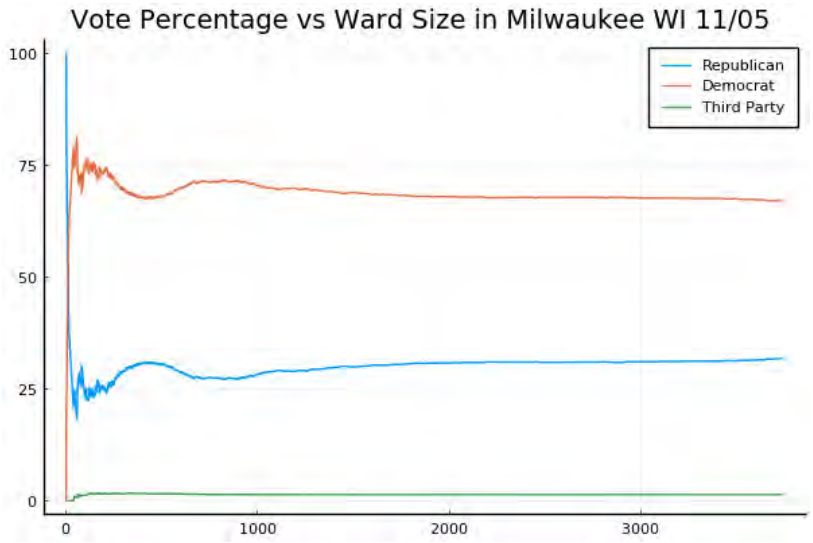

Figure 9: Milwaukee Democrat Ballots Percentage vs Ward Size

size, you will see trendlines that do not converge to an asymptote, as shown in Figure 9. It appears that smaller precincts almost uniformly have higher Democrat percentages. There is no obvious reason for this. It was certainly not seen in the control case in Figure 8. Furthermore the third party percentages quickly converge to their asymptote as would be expected in a fair election. One possible model for this would be vote switching from Trump to Biden, which would show up more strongly in the smaller precincts.

5 Analysis of Third Party Vote Count

Third party voters offer another way to examine a possible fraud mechanism. Votes could either be switched from third party candidates to the cheater, or fraudulent ballots that are added to benefit the cheater, may not include third party choices. For the control example, we look at absentee ballots in the state of Massachusetts. In Massachusetts the initial absentee ballot count was 117,618, and the number of added absentee ballots is 10,281.

The reported 3rd party percentage of absentee ballots vs time in Massachusetts is shown in Figure 10 and the comparison of the inital and added 3rd party ballots in MA is shown in Figure 11. There is only a small change in party preference, relative to the size of the added ballots. Therefore the probability of the fraud model is only 22%.

When we look at the total 3rd party percentages in Milwaukee, between Wednesday morning and Thursday night, we see a significant drop from 1.9 percent to 1.4% for the newly added ballots. But this is among 293,159 added

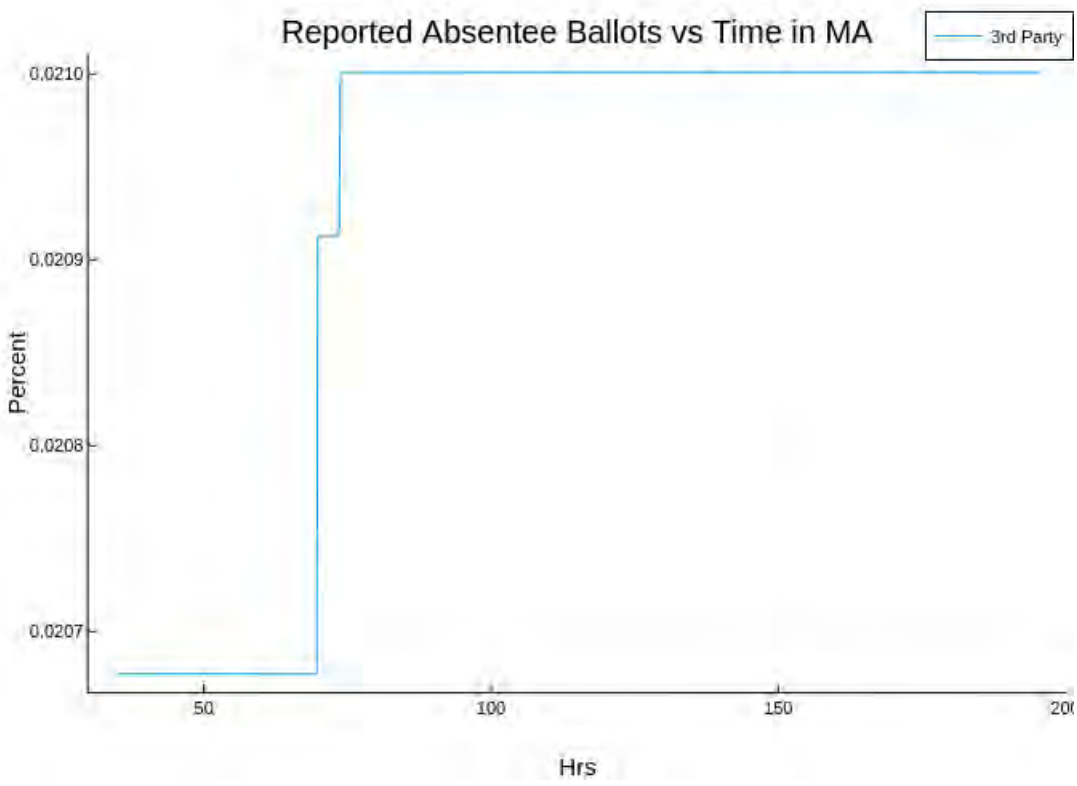

Figure 10: MA 3rd Party Absentee Votes vs Time

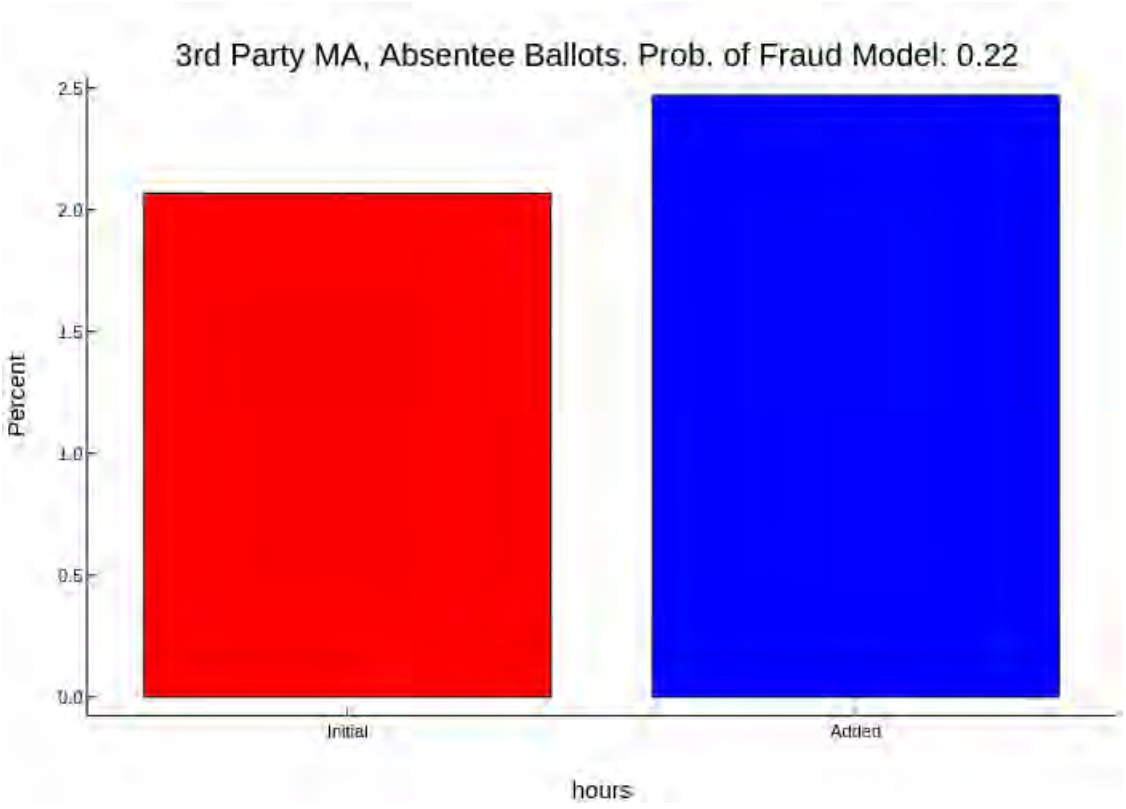

Figure 11: MA 3rd Party Percentage Initial and Added

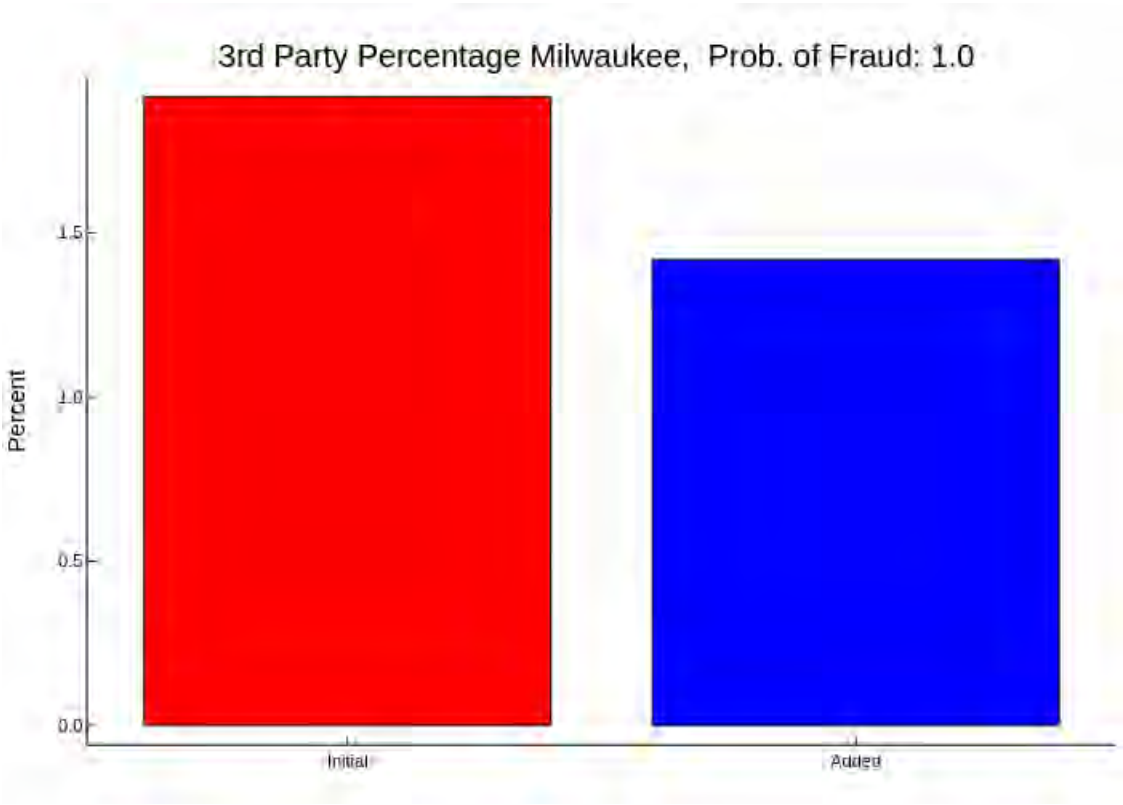

Figure 12: Milwaukee 3rd Party Percentages between Wednesday and Added

ballots. This is illustrated in Figure 12. Again in this case the fraud model has a posterior probability of 100% to machine precision.

6 Analysis of Fulton and DeKalb Counties in Georgia

We perform a precinct level analysis of Fulton and DeKalb counties in Georgia based on an aggregate data set likely culled from the New York Times. The Fulton data was collected on 11/08/2020 and the DeKalb data was collected on 11/09/2020. As in Milwaukee we look at the cumulative vote percentages as a function of precinct size. A plot of this for DeKalb county is shown in Figure 13.

Although there are somewhat concerning trendlines in the beginning, after the size 600 precinct mark, thereafter the overall picture is what one would expect of an election where the voter preferences are not dependent on precinct size. Both DeKalb and Fulton counties are in predominantly urban Atlanta,

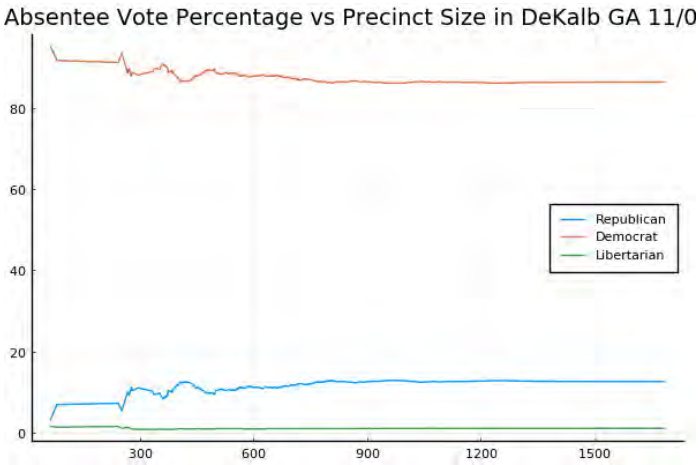

Figure 13: Dekalb County Absentee Ballots: Percentages vs Precinct Size

neighbor one another, and have similar voting preferences across precincts. DeKalb county is still suspect, however, due to the irregularites observed prior to the Ward 600 mark.

A different story emerges when we plot the absentee vote percentages for Fulton county as a function of precinct size, as can be seen in Figure 14. Here the trendlines for the Democrat and Republican percentages are quite pronounced, amounting to a difference of 8 percent from the halfway mark.

We divide the Fulton county data into a group of smaller precincts and larger precincts. One group has precincts less than 308 and another larger than 308. The total absentee ballots for the small group is 24,575, and the large group is 120,029. The small group has a Democrat percentage of 85% and the large group has a percentage of 77%, for a change of 8%. The fraud model is preferred in this scenario again with probability of 100% to machine precision.

One might presume that small precincts generally favor Democrats over large precincts, biasing the results. However take a closer look at the Libertarian party results in Fulton county in Figure 15. The percentages are exactly what we would expect if there were no bias in precinct size. The percentages bounce around a mean, not trending in any direction.

So if there were a bias favoring the democrats in small precincts, we would expect that to effect both the Republican and Libertarian totals. However it appears to only effect Republican totals, as if the Republican ballots were switched over to Democrat in a higher percentage in the smaller precincts. Indeed if a fixed number of ballots are switched in each district, it would have a larger effect in the smaller districts and then show up as trend lines in these percentage plots. At a minimum the data suggests a statistical anomaly that is not normally present in a fair election.

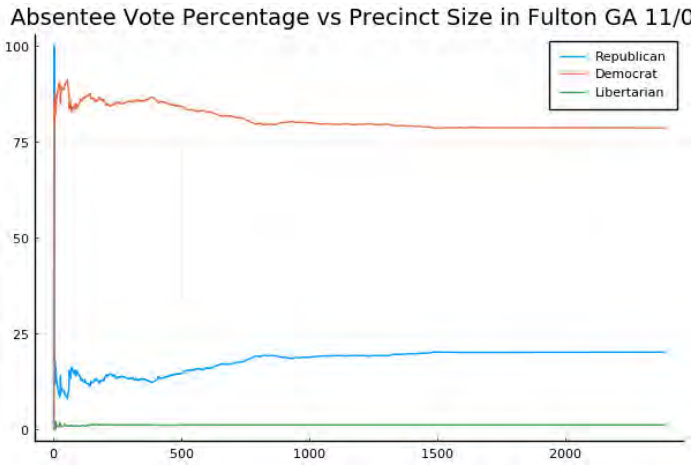

Figure 14: Fulton County Absentee Ballots: Percentages vs Precinct Size

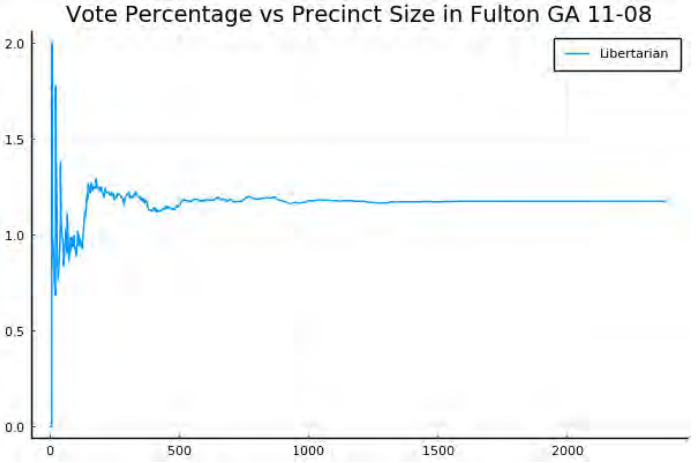

Figure 15: Fulton County Absentee Ballots: Libertarian Percentage vs Precinct Size

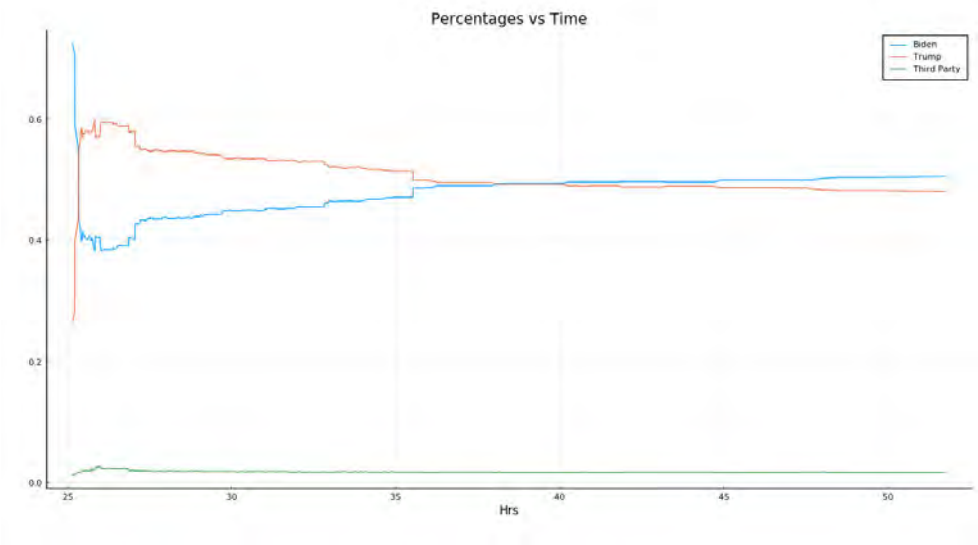

Figure 16: Michigan Vote Percentage vs Time

7 Michigan Analysis

We now due a time series analysis for Michigan. The data was culled from Edison Research. We first show, Trump, Biden and 3rd party voting percentages vs hours after the start of the election in Figure 16. The third party votes shows the proper convergence to an asymptote that we would expect from the law of large numbers. However the Trump and Biden percentages are vastly different You can see large discrete jumps in the percentages as very large Biden ballot dumps occur over time. You also see that the Biden percentages are mostly always increasing after hour 27, which is statistically unlikely in a fair election.

Note also that almost a million of the ballots are received by hour 27, and we use this as our starting point. At that point we have a total of 970,119 votes cast. At the end of 167 hours we have 5,531,222 votes cast. At our initial point the Biden percentage is 38%, but the new ballots have a Biden percentage totaling 53% as seen in Figure 17. The fraud model has posterior likelihood of 100% to machine precision.

For Michigan we compute the estimated amount of fraudulent Biden ballots conservatively, assuming that the 50.5 percent seen at the end of the count should have been the correct percentage among the newly added ballots. From this and (4) we obtain an estimate of 237,140 fraudulent votes added for Biden.

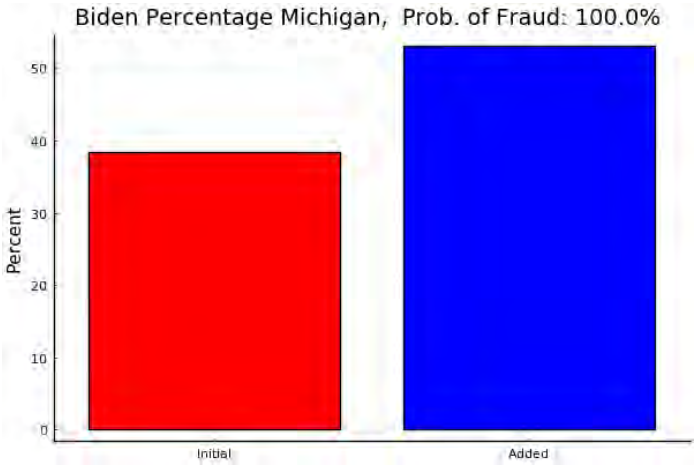

Figure 17: Biden Percentage Before and Added

INSTRUCTIONS FOR ATTORNEYS COMPLETING CIVIL COVER SHEET FORM JS 44

Authority For Civil Cover Sheet

The JS 44 civil cover sheet and the information contained herein neither replaces nor supplements the filings and service of pleading or other papers as required by law, except as provided by local rules of court. This form, approved by the Judicial Conference of the United States in September 1974, is required for the use of the Clerk of Court for the purpose of initiating the civil docket sheet. Consequently, a civil cover sheet is submitted to the Clerk of Court for each civil complaint filed. The attorney filing a case should complete the form as follows:

I.(a) **Plaintiffs-Defendants.** Enter names (last, first, middle initial) of plaintiff and defendant. If the plaintiff or defendant is a government agency, use only the full name or standard abbreviations. If the plaintiff or defendant is an official within a government agency, identify first the agency and then the official, giving both name and title.

(b) **County of Residence.** For each civil case filed, except U.S. plaintiff cases, enter the name of the county where the first listed plaintiff resides at the time of filing. In U.S. plaintiff cases, enter the name of the county in which the first listed defendant resides at the time of filing. (NOTE: In land condemnation cases, the county of residence of the "defendant" is the location of the tract of land involved.)

(c) **Attorneys.** Enter the firm name, address, telephone number, and attorney of record. If there are several attorneys, list them on an attachment, noting in this section "(see attachment)".

II. **Jurisdiction.** The basis of jurisdiction is set forth under Rule 8(a), F.R.Cv.P., which requires that jurisdictions be shown in pleadings. Place an "X" in one of the boxes. If there is more than one basis of jurisdiction, precedence is given in the order shown below.
United States plaintiff. (1) Jurisdiction based on 28 U.S.C. 1345 and 1348. Suits by agencies and officers of the United States are included here.
United States defendant. (2) When the plaintiff is suing the United States, its officers or agencies, place an "X" in this box.
Federal question. (3) This refers to suits under 28 U.S.C. 1331, where jurisdiction arises under the Constitution of the United States, an amendment to the Constitution, an act of Congress or a treaty of the United States. In cases where the U.S. is a party, the U.S. plaintiff or defendant code takes precedence, and box 1 or 2 should be marked.
Diversity of citizenship. (4) This refers to suits under 28 U.S.C. 1332, where parties are citizens of different states. When Box 4 is checked, the citizenship of the different parties must be checked**.** (See Section III below**; NOTE: federal question actions take precedence over diversity cases.**)

III. **Residence (citizenship) of Principal Parties.** This section of the JS 44 is to be completed if diversity of citizenship was indicated above. Mark this section for each principal party.

IV. **Nature of Suit.** Place an "X" in the appropriate box. If there are multiple nature of suit codes associated with the case, pick the nature of suit code that is most applicable. Click here for: Nature of Suit Code Descriptions.

V. **Origin.** Place an "X" in one of the seven boxes.
Original Proceedings. (1) Cases which originate in the United States district courts.
Removed from State Court. (2) Proceedings initiated in state courts may be removed to the district courts under Title 28 U.S.C., Section 1441.
Remanded from Appellate Court. (3) Check this box for cases remanded to the district court for further action. Use the date of remand as the filing date.
Reinstated or Reopened. (4) Check this box for cases reinstated or reopened in the district court. Use the reopening date as the filing date.
Transferred from Another District. (5) For cases transferred under Title 28 U.S.C. Section 1404(a). Do not use this for within district transfers or multidistrict litigation transfers.
Multidistrict Litigation – Transfer. (6) Check this box when a multidistrict case is transferred into the district under authority of Title 28 U.S.C. Section 1407.
Multidistrict Litigation – Direct File. (8) Check this box when a multidistrict case is filed in the same district as the Master MDL docket.
PLEASE NOTE THAT THERE IS NOT AN ORIGIN CODE 7. Origin Code 7 was used for historical records and is no longer relevant due to changes in statue.

VI. **Cause of Action.** Report the civil statute directly related to the cause of action and give a brief description of the cause. **Do not cite jurisdictional statutes unless diversity.** Example: U.S. Civil Statute: 47 USC 553 Brief Description: Unauthorized reception of cable service.

VII. **Requested in Complaint.** Class Action. Place an "X" in this box if you are filing a class action under Rule 23, F.R.Cv.P.
Demand. In this space enter the actual dollar amount being demanded or indicate other demand, such as a preliminary injunction.
Jury Demand. Check the appropriate box to indicate whether or not a jury is being demanded.

VIII. **Related Cases.** This section of the JS 44 is used to reference related pending cases, if any. If there are related pending cases, insert the docket numbers and the corresponding judge names for such cases.

Date and Attorney Signature. Date and sign the civil cover sheet.

IN THE UNITED STATES DISTRICT COURT

EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN and DERRICK VAN ORDEN,

Plaintiffs.

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARLC L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN HUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

CASE NO. 2:20-cv-1771

PLAINTIFFS' MOTION FOR DECLARATORY, EMERGENCY, AND PERMANENT INJUNCTIVE RELIEF

Pursuant to FRCP 65 and Civil L. R. 7, COMES NOW Plaintiffs, William Feehan and Derrick Van Orden, by and through their undersigned counsel, and file this Emergency Motion for Temporary Restraining Order and Permanent Injunctive Relief.

The specific relief requested by Plaintiff is set forth in the proposed form of Order is attached. The basis for the Motion is set forth in Plaintiffs Memorandum submitted in support.

Respectfully submitted, this 30th day of November 2020.

/s Sidney Powell*

*Application for admission forthcoming

CERTIFICATE OF SERVICE

This is to certify that I have on this day e-filed the foregoing Plaintiffs' Motion To File Affidavits Under Seal and For In Camera Review with the Clerk of Court using the CM/ECF system, and that I have delivered the filing to the Defendants by email and FedEx at the following addresses:

IN THE UNITED STATES DISTRICT COURT

EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN and DERRICK VAN ORDEN,

Plaintiffs.

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARLC L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN HUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

CASE NO. 2:20-cv-1771

PLAINTIFFS' MEMORANDUM IN SUPPORT OF MOTION FOR DECLARATORY, EMERGENCY, AND PERMANENT INJUNCTIVE RELIEF

FACTS

The facts relevant to this motion are set forth in the Complaint and its accompanying exhibits, all of which are respectfully incorporated herein by reference. We present only a summary.

After a general election and recount, Joe Biden has been declared the winner of Georgia's General Election for President by a difference of 20,585 votes, while Plaintiff Derrick Van Orden lost his race for the House of Representatives seat for Wisconsin's Third Congressional District

by approximately 10,000 votes. But the vote count certified by defendants on November 30, 2020 fails to recognize the votes are steeped in fraud. Tens of thousands of votes counted toward Mr. Biden's final tally were the product of fraudulent, illegal, ineligible and outright fictitious ballots. Plaintiffs support this claim through the evidence laid out in the Complaint which includes the following conclusions:

The Complaint details a pervasive pattern of illegal conduct by Defendants where they systematically ignored, or acted in direct contravention of, the express requirements of Wisconsin Election Code provisions specifically intended to prevent voter fraud such as voter Photo ID, witness, signature, eligibility and address verification requirements, supported by witness affidavits and even written guidance from Defendant Wisconsin Elections Commission ("WEC") instructing election workers to violate the Wisconsin Election Code. *See* Compl., Section I.

In Section II and III of the Complaint, Plaintiffs demonstrate through statistical analysis of voting results and technical analysis of voting machines and software that each of several distinct categories of voting fraud or batches of fraudulent ballots were larger than Biden's 20,585 margin.

The Affidavit of Russell James Ramsland, Jr. first examines the widely reported and "statistically impossible" Biden "spike" on November 4 where Biden, trailing Trump by a few percent, suddenly received 143,379 votes in a single five-minute interval, causing his relatively flat vote tally to make a vertical jump up and over Trump to take the lead by about one percent. *See* Compl., Ex. 17 ¶13. Another red flag identified by Mr. Ramsland is the historically unprecedented turnout levels (not just for Wisconsin, but for anywhere except for countries like North Korea): 69 out of 72 Wisconsin counties had "voter turnout figures higher than 80%, a

threshold generally considered to be the maximum expected," 59 were above 90%, and two were nearly 200% or more. *Id.* ¶15. Mr. Ramsland concludes "to a reasonable degree of professional certainty" that the Biden spike included at least 119,430 illegal votes for Biden, while the total illegal votes from the fraudulent turnout figures was at least 384,085. *Id.* ¶14.

The Complaint provides testimony from several other experts who provided the estimates for illegal votes that should be discarded due to other categories of voting fraud:

- The report of William M. Briggs, Ph.D. finding that the average sum of two types of errors or fraud (either by Wisconsin election officials or third parties) – (1) absentee voters who were recorded as receiving ballots without requesting them and (2) absentee voters who returned ballots that were recorded as unreturned – was 29,594 votes (or nearly 31% of total). (*See id.*, Ex 2).

- Matt Braynard used the National Change of Address database to identify votes by persons that moved out of state or subsequently registered to vote in another state for the 2020 election, and found a total of 6,966 ineligible votes. (*See id.*, Ex 3).

- A separate analysis by Mr. Braynard of the likely number of votes that were improperly relying on the "indefinitely confined" exemption to voter ID to be 96,437 (*See id.*, Ex 3).

- Another expert witness, whose testimony has been redacted for his safety, estimates excess votes arising from the statistically significant outperformance of Dominion machines on behalf of Joe Biden to be 181,440. (*See id.*, Ex 3)

Thus each of these sources of fraudulent votes (with the exception of the still substantial number of illegal out-of-state voters) is larger than Biden's margin of victory, and if any of these categories of illegal voters were thrown out, it would change the result of the election, and give President Trump a second term – and Plaintiff Van Order a first term as a Congressman.

Section III of the Complaint also provides testimony from experts regarding the security flaws in Wisconsin voting machines, in particular, Dominion Voting Systems ("Dominion") that allow Dominion, as well domestic and foreign actors, to alter, destroy, manipulate or exfiltrate ballot and other voting data, and potentially to do so without a trace due to Dominion's

unprotected logs. For example, the Complaint includes an analysis of the Dominion software system by a former US Military Intelligence expert concludes that the system and software have been accessible and were certainly compromised by rogue actors, such as Iran and China. (*See* Compl., Ex.105). By using servers and employees connected with rogue actors and hostile foreign influences combined with numerous easily discoverable leaked credentials, Dominion neglectfully allowed foreign adversaries to access data and intentionally provided access to their infrastructure in order to monitor and manipulate elections, including the most recent one in 2020. The substantial likelihood that hostile foreign governments, with or without active collusion or collaboration with the Defendants, is a separate and independent ground to grant the declaratory and injunctive relief requested in the Complaint and this Motion.

DISCUSSION

Plaintiffs Have Standing

Plaintiff William Feehan**,** is a registered Wisconsin voter and a nominee of the Republican Party to be a Presidential Elector on behalf of the State of Wisconsin. The Plaintiff Derrick Van Orden was the 2020 Republican nominee for Wisconsin's Third Congressional District Seat for the United States House of Representatives. As a candidate for elective office, each Plaintiff "have a cognizable interest in ensuring that the final vote tally reflects the legally valid votes cast," as "[a]n inaccurate vote tally is a concrete and particularized injury to candidates such as the Electors." *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020) (affirming that Presidential Electors have Article III and prudential standing to challenge actions of Secretary of State in implementing or modifying State election laws); *see also McPherson v. Blacker*, 146 U.S. 1, 27 (1892); *Bush v. Palm Beach Cty. Canvassing Bd.*, 531 U.S. 70, 76 (2000) (per curiam).

Plaintiffs are Entitled to Injunctive Relief.

"To obtain a preliminary injunction, a plaintiff must show three things: (1) without such relief, he will suffer irreparable harm before his claim is finally resolved; (2) he has no adequate remedy at law; and (3) he has some likelihood of success on the merits. *Harlan v. Scholz*, 866 F.3d 754, 758 (7th Cir. 2017) (*citing Girl Scouts of Manitou Council, Inc. v. Girl Scouts of U.S. of Am*., Inc., 549 F.3d 1079, 1086 (7th Cir. 2008)." "If the plaintiff can do that much, the court must then weigh the harm the plaintiff will suffer without an injunction against the harm the defendant will suffer with one." *Harlin*, 866 F.3d at 758 (*citing Ty, Inc. v. Jones Grp., Inc*., 237 F.3d 891, 895 (7th Cir. 2001). In addition, the court must ask whether the preliminary injunction is in the public interest. *Jones v. Markiewicz-Qualkinbush*, 842 F.3d 1053, 1058 (7th Cir. 2016).

All elements are met here.

"When the state legislature vests the right to vote for President in its people, the right to vote as the legislature has prescribed is fundamental; and one source of its fundamental nature lies in the equal weight accorded to each vote and the equal dignity owed to each voter." *Bush v. Gore*, 531 U.S. 98, 104 (2000) (emphasis added). The evidence shows not only that Defendants failed to administer the November 3, 2020 election in compliance with the manner prescribed by the Georgia legislature, but that Defendants committed a scheme and artifice to fraudulently and illegally manipulate the vote count to make certain the election of Joe Biden as President of the United States. This conduct violated Plaintiffs' equal protection and due process rights as well their rights under Wisconsin law.

Plaintiffs have a substantial likelihood of success.

The Plaintiff does not need to demonstrate a likelihood of absolute success on the merits. "Instead, [it] must only show that [its] chances to succeed on his claims are 'better than negligible.'

" Whitaker v. Kenosha Unified Sch. Dist. No. 1 Bd. of Educ., 858 F.3d 1034, 1046 (7th Cir. 2017). (quoting Cooper v. Salazar, 196 F.3d 809, 813 (7th Cir. 1999)). "This is a low threshold," *id.*, that Plaintiffs have easily passed.

Through detailed fact and expert testimony including documentary evidence contained in the Complaint and its exhibits, Plaintiffs have made a compelling showing that Defendants' intentional actions jeopardized the rights of Wisconsin citizens to select their leaders under the process set out by the Wisconsin Legislature through the commission of election frauds that violated state laws and the Equal Protection Clause in the United States Constitution. And pursuant to 42 U.S.C. § 1983, plaintiffs must demonstrate by a preponderance of the evidence that their constitutional rights to equal protection or fundamental right to vote were violated. *See, e.g., Radentz v. Marion Cty*., 640 F.3d 754, 756-757 (7th Cir. 2011).

The tally of ballots certified by Defendants giving Mr. Biden the lead with 20,800 votes cannot possibly stand in light of the thousands of illegal mail-in ballots that were improperly counted and the vote manipulation caused by the Dominion software.

Plaintiffs' equal protection claim is straightforward. The right of qualified citizens to vote in a state election involving federal candidates is recognized as a fundamental right under the Fourteenth Amendment of the United States Constitution. *Harper v. Va. State Bd. of Elections*, 383 U.S. 663, 665 (1966). *See also Reynolds v. Sims,* 377 U.S. 533, 554 (1964) (The Fourteenth Amendment protects the "the right of all qualified citizens to vote, in state as well as in federal elections."). Indeed, ever since the Slaughter-House Cases, 83 U.S. 36 (1873), the United States Supreme Court has held that the Privileges or Immunities Clause of the Fourteenth Amendment protects certain rights of federal citizenship from state interference, including the right of citizens to directly elect members of Congress. *See Twining v. New Jersey*, 211 U.S. 78,

97 (1908) (citing Ex parte Yarbrough, 110 U.S. 651, 663-64 (1884)). *See also Oregon v. Mitchell*, 400 U.S. 112, 148-49 (1970) (Douglas, J., concurring) (collecting cases).

The fundamental right to vote protected by the Fourteenth Amendment is cherished in our nation because it "is preservative of other basic civil and political rights." *Reynolds*, 377 U.S. at 562; *League of Women Voters of Ohio v. Brunner*, 548 F.3d 463,476 (6th Cir. 2008) ("The right to vote is a fundamental right, preservative of all rights."). Voters have a "right to cast a ballot in an election free from the taint of intimidation and fraud," *Burson v. Freeman*, 504 U.S. 191, 211 (1992), and "[c]onfidence in the integrity of our electoral processes is essential to the functioning of our participatory democracy." *Purcell v. Gonzalez*, 549 U.S. 1, 4 (2006) (per curiam).

"Obviously included within the right to [vote], secured by the Constitution, is the right of qualified voters within a state to cast their ballots and have them counted" if they are validly cast. *United States v. Classic*, 313 U.S. 299, 315 (1941). "[T]he right to have the vote counted" means counted "at full value without dilution or discount." *Reynolds*, 377 U.S. at 555, n.29 (quoting *South v. Peters*, 339 U.S. 276, 279 (1950) (Douglas, J., dissenting)).

"Every voter in a federal . . . election, whether he votes for a candidate with little chance of winning or for one with little chance of losing, has a right under the Constitution to have his vote fairly counted, without its being distorted by fraudulently cast votes." *Anderson v. United States,* 417 U.S. 211, 227 (1974); *see also Baker v. Carr,* 369 U.S. 186, 208 (1962). Invalid or fraudulent votes "debase[]" and "dilute" the weight of each validly cast vote. *See Anderson*, 417 U.S. at 227.

The right to an honest [count] is a right possessed by each voting elector, and to the extent that the importance of his vote is nullified, wholly or in part, he has been injured in the

free exercise of a right or privilege secured to him by the laws and Constitution of the United States." *Anderson*, 417 U.S. at 226 (*quoting Prichard v. United States*, 181 F.2d 326, 331 (6th Cir.), *aff'd due to absence of quorum*, 339 U.S. 974 (1950)).

Practices that promote the casting of illegal or unreliable ballots or fail to contain basic minimum guarantees against such conduct, can violate the Fourteenth Amendment by leading to the dilution of validly cast ballots. *See Reynolds*, 377 U.S. at 555 ("[T]he right of suffrage can be denied by a debasement or dilution of the weight of a citizen's vote just as effectively as by wholly prohibiting the free exercise of the franchise."). States may not, by arbitrary action or other unreasonable impairment, burden a citizen's right to vote. *See Baker v. Carr*, 369 U.S. 186, 208 (1962) ("citizen's right to a vote free of arbitrary impairment by state action has been judicially recognized as a right secured by the Constitution").

"Having once granted the right to vote on equal terms, the state may not, by later arbitrary and disparate treatment, value one person's vote over that of another." *Bush*, 531 U.S. at 104-05. Among other things, this requires "specific rules designed to ensure uniform treatment" in order to prevent "arbitrary and disparate treatment of voters." *Id*. at 106-07; *see also Dunn v. Bloomstein*, 405 U.S. 330, 336 (1972) (providing that each citizen "has a constitutionally protected right to participate in elections on an equal basis with other citizens in the jurisdiction"). Similarly, equal protection needs to be recognized in this case where many Wisconsin's citizens' lawful votes remained uncounted, and many were diluted by unlawful votes in violation of the Equal Protection clause.

The Plaintiffs will suffer Irreparable Harm

"Where, as here, plaintiff has demonstrated a likelihood of success on the merits as to a constitutional claim, such an injury has been held to constitute irreparable harm." *Democratic*

Nat'l Comm. v. Bostelmann, 447 F.Supp.3d 757, 769 (W.D. Wis. 2020) (*citing Elrod v. Burns*, 427 U.S. 347, 373, 96 S.Ct. 2673, 49 L.Ed.2d 547 (1976) (where plaintiff had proven a probability of success on the merits, the threatened loss of First Amendment freedoms "unquestionably constitutes irreparable injury"); *see also Preston v. Thompson*, 589 F.2d 300, 303 n.4 (7th Cir. 1978) ("The existence of a continuing constitutional violation constitutes proof of an irreparable harm.").

Moreover, courts have specifically held that infringement on the fundamental right to vote constitutes irreparable injury. *See Obama for Am. v. Husted*, 697 F.3d 423, 435 (6th Cir. 2012) ("A restriction on the fundamental right to vote ... constitutes irreparable injury."); *Williams v. Salerno*, 792 F.2d 323, 326 (2d Cir. 1986) (holding that plaintiffs "would certainly suffer irreparable harm if their right to vote were impinged upon")." \

"Additionally, traditional legal remedies would be inadequate, since infringement on a citizens' constitutional right to vote cannot be redressed by money damages." *Bostelmann*, 447 F.Supp.3d at 769 (*citing Christian Legal Soc'y v. Walker*, 453 F.3d 853, 859 (7th Cir. 2006) ("The loss of First Amendment freedoms is presumed to constitute an irreparable injury for which money damages are not adequate."); *League of Women* Voters *of N. Carolina v. North Carolina*, 769 F.3d 224, 247 (4th Cir. 2014) ("[O]nce the election occurs, there can be no do-over and no redress.")."

The Balance of Harms & Public Interest

Under Seventh Circuit law, a "sliding scale" approach is used for balancing of harms: "[t]he more likely it is that [the movant] will win its case on the merits, the less the balance of harms need weigh in its favor." *Girl Scouts of Manitou Council v. Girl Scouts of United States of Am., Inc.*, 549 F.3d 1079, 1100 (7th Cir. 2008). Plaintiffs above have shown their strong

likelihood of success on the merits above. The low costs to Defendants and high potential harm to Plaintiffs make this a case with a substantial net harm that an immediate and emergency injunctive relief can prevent.

In this regard, Plaintiffs would highlight a recent Eleventh Circuit decision addressed a claim in 2018 related to Georgia's voting system and Dominion Voting Systems that bears on the likelihood of Plaintiffs' success on the merits and the balance of harms in the absence of injunctive relief:

> In summary, while further evidence will be necessary in the future, the Court finds that the combination of the statistical evidence and witness declarations in the record here (and the expert witness evidence in the related *Curling* case which the Court takes notice of) persuasively demonstrates the likelihood of Plaintiff succeeding on its claims. Plaintiff has shown a substantial likelihood of proving that the Secretary's failure to properly maintain a reliable and secure voter registration system has and will continue to result in the infringement of the rights of the voters to cast their **vote** and have their **votes** counted.

Common Cause Georgia v. Kemp, 347 F. Supp. 3d 1270, 1294-1295, (11th Cir. 2018).

Therefore, it is respectfully requested that the Court grant Plaintiffs' Motion and enter the proposed Order submitted therewith.

Respectfully submitted, this 30th day of November 2020.

Defendants.

CASE NO. 2:20-cv-1771

ORDER GRANTING EMERGENCY INJUNCTIVE RELIEF

THE COURT has before it Plaintiffs' Emergency Motion for Injunctive Relief filed December 1, 2020, seeking:

1. An order directing the Defendants Wisconsin Elections Commission and Governor Tony Evers not to certify or to de-certify the 2020 election results in the Presidential and District 3 Congressional races;

2. An order enjoining Defendants from transmitting the currently certified Presidential election results to the Electoral College;

3. An order requiring Governor Evers to transmit certified Presidential election results that state that President Donald Trump is the winner of the election;

4. An immediate emergency order to seize and impound all servers, software, voting machines, tabulators, printers, portable media, logs, ballot applications, ballot return envelopes, ballot images,

paper ballots, and all "election materials" referenced in Wisconsin Statutes § 9.01(1)(b)11. related to the November 3, 2020 Wisconsin election for forensic audit and inspection by the Plaintiffs;

5. An order that no votes received or tabulated by machines that were not certified as required by federal and state law be counted;

6. A declaratory judgment declaring that Wisconsin's failed system of signature verification violates the Electors and Elections Clause by working a de facto abolition of the signature verification requirement;

7. A declaratory judgment declaring that currently certified election results violate the Due Process Clause, U.S. CONST. Amend. XIV;

8. A declaratory judgment declaring that mail-in and absentee ballot fraud must be remedied with an individual manual recount or statistically valid sampling that properly verifies a ballot application for each absentee ballot, that verifies the signatures on absentee ballot envelopes, and that invalidates the certified results in the Presidential and District 3 Congressional races if the recount or sampling analysis shows a sufficient number of ineligible absentee ballots were counted;

9. A declaratory judgment declaring absentee ballot fraud occurred in violation of Constitutional rights, Election laws and under Wisconsin state law; and

10. A permanent injunction prohibiting the Governor and the Wisconsin Elections Commission from transmitting the currently certified results to the Electoral College based on the overwhelming evidence of election tampering.

Plaintiffs also contend that any recalibration or reset of voting machines, tabulations machines, or other election-related mechanisms, servers, software, voting machines, tabulators, printers, portable media, logs, or processes, and any alteration or destruction of ballot applications, ballot return envelopes, ballot images, paper ballots, registration lists, poll lists, or any other "election materials" referenced in Wisconsin Statutes § 9.01(1)(b)11. related to the November 3, 2020

Wisconsin election, whether pursuant to § 7.23, Wisconsin Statutes, or otherwise, will make it impossible to conduct a valid recount or inspection by Plaintiffs' experts or others.

Plaintiffs contend any such act and any like it must be immediately enjoined across the state of Wisconsin pursuant to 52 U.S.C. § 20701 (preservation of voting records) because resetting the machines or other alteration or destruction of election equipment, records, or other materials would destroy the evidence or alter evidence and make impossible any forensic computer audit of the election computer systems for the November 3, 2020 General Election.

Plaintiffs therefore ask for an injunction to prevent any wiping or alteration of data or other records or materials, and to ensure forensic analysis can take place.

Plaintiffs further ask for emergency injunctive to expedite the flow of discovery material and to preserve all voting-related computer data information.

The Court has reviewed the terms and conditions of this Emergent Injunctive Relief Order, and for good cause shown IT IS HEREBY ORDERED THAT:

1. A Temporary Restraining Order is immediately in effect to preserve the voting machines in the State of Wisconsin, and to prevent any wiping or alteration of data or other records or materials, until such time as a full computer audit is completed;

2. Governor Evers and the Wisconsin Elections Commission are to de-certify the election results;

3. Governor Evers is hereby enjoined from transmitting the currently certified election results to the Electoral College;

4. Governor Evers is required to transmit certified election results that state that President Donald Trump is the winner of the election;

5. It is hereby Ordered that no votes received or tabulated by machines that were not certified as required by federal and state law be counted;

6. It is hereby declared and ordered that Wisconsin's failed system of signature verification violates the Electors and Elections Clause by working a de facto abolition of the signature verification requirement;

7. It is hereby declared and ordered that the currently certified election results violate the Due Process Clause, U.S. CONST. Amend. XIV;

8. It is hereby declared and ordered that mail-in and absentee ballot fraud must be remedied with a Full Manual Recount or statistically valid sampling that properly verifies a ballot application for each absentee ballot, that verifies the signatures on absentee ballot envelopes, and that invalidates the certified results in the Presidential and District 3 Congressional races if the recount or sampling analysis shows a sufficient number of ineligible absentee ballots were counted;

9. It is hereby declared that absentee ballot fraud occurred in violation of Constitutional rights, Election laws and under Wisconsin state law; and

10. It is hereby declared and ordered that Governor Evers and the Wisconsin Elections Commission are enjoined from transmitting the currently certified results to the Electoral College based on the overwhelming evidence of election tampering;

It is so Ordered, this ___ day of December, 2020.

_____

Hon. Pamela Pepper
District Court Judge
Eastern District of Wisconsin, Milwaukee Division

UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,
and DERRICK VAN ORDEN,

Plaintiffs,

Case No. 20-cv-1771-pp

v.

WISCONSIN ELECTIONS COMMISSION, *et al.*,

Defendants.

ORDER REGARDING AMENDED MOTION FOR INJUNCTIVE RELIEF (DKT. NO. 6)

On the morning of December 1, 2020, the plaintiffs filed a complaint (Dkt. No. 1) and a motion for declaratory, emergency and permanent injunctive relief (Dkt. No. 2). The complaint is not verified.

The motion indicated that the specific relief the plaintiffs were requesting was laid out in an attached order. Dkt. No. 2 at 1. This language was highlighted and in a larger font than the rest of the motion. There was no order attached. At the end of the motion, under the words "Certificate of Service," the following statement appeared (also highlighted): "This is to certify that I have on this day e-filed the foregoing Plaintiffs' Motion to File Affidavits Under Seal and For In Camera Review with the Clerk of Court using the CM/ECF system, and that I have delivered the filing to the Defendants by email and FedEx at the following addresses:". Id. at 2. No addresses were listed below this statement

and no documents were filed under seal. There was no request for *in camera* review.

Under Federal Rule of Civil Procedure 65(b), a court cannot issue a temporary restraining order without written or oral notice to the adverse party or that party's attorney unless the moving party (a) files an affidavit or "verified complaint" containing specific facts that clearly show that immediate and irreparable injury, loss or damage will result to the movant before the adverse party has a chance to be heard in opposition, and (b) the movant's attorney certifies in writing any efforts made to give notice and the reasons why notice should not be required. There was no indication that the plaintiffs gave notice to the adverse parties of the morning's motion, there was no affidavit filed with the motion, the complaint is not verified and there was no certification from counsel about the efforts made to give notice to the adverse parties or why notice should not be required.

At 3:15 that afternoon, the plaintiffs filed another document. It appears on the docket as a motion to amend or correct, but the document itself is captioned, "Plaintiffs' Corrected Motion for Declaratory, Emergency, and Permanent Injunctive Relief." Dkt. No. 6. This motion indicates that the earlier motion was an inadvertently filed draft and acknowledges that the referenced proposed order had not been attached. Id. at 1. At the end of the "corrected," or amended, motion, under the heading "Certificate of Electronic Service," the motion states,

> Pursuant to FRCP 65, this is to certify that upon filing of this Motion, Plaintiffs will provide electronic notice to Defendants of this Action and Motion as follows:
>
> > Defendants Wisconsin Elections Commission and Wisconsin Elections Commissioners:
> > elections@wi.gov
> >
> > Defendant Governor Tony Evers
> > eversinfo@wisconsin.gov

Id. at 3.

There is a proposed order attached to the afternoon's amended motion. Dkt. No. 6-1. The proposed order asks various injunctions, declarations and orders. It does not ask for a hearing.

Because the afternoon motion indicates that the plaintiffs "will" provide electronic notice to the adverse parties, the court does not know whether the plaintiffs have yet provided notice to the adverse parties or when they will do so. Until the plaintiffs notify the court that they have provided notice to the adverse parties, the court will not take any action because the motion does not comply with the requirements of Rule 65(b).

If the plaintiffs *have* provided notice to the adverse parties, under Civil Local Rule 7(b) (E.D. Wis.) those parties have twenty-one days to respond to the motion and under Civil L.R. 7(c) the plaintiffs have fourteen days to reply. While the caption of the motion includes the word "emergency" and the attached proposed order seeks an "expedited" injunction, neither the motion nor the proposed order indicate whether the plaintiffs are asking the court to act more quickly or why. As indicated, the motion does not request a hearing. It does not propose a briefing schedule.

If the plaintiffs believe an expedited briefing schedule is necessary or warranted, they may contact chambers, with representatives of the adverse parties on the line, and request a telephone hearing. Otherwise, the court will await the defendants' opposition brief.

Dated in Milwaukee, Wisconsin this 2nd day of December, 2020.

EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff, **CASE NO. 2:20-cv-1771**

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

AMENDED COMPLAINT FOR DECLARATORY, EMERGENCY, AND PERMANENT INJUNCTIVE RELIEF

NATURE OF THE ACTION

1. This civil action brings to light a massive election fraud, multiple violations of Wisconsin Statutes Chapters 5 – 12 (hereafter, "Wisconsin Election Code"), *see, e.g.,* Wis. Stat. §§ 5.03, *et. seq.*, in addition to the Election and Electors Clauses and Equal Protection Clause of the U.S. Constitution. These violations occurred during the 2020 General Election in the City of Milwaukee, southeastern Wisconsin counties, and throughout the State of Wisconsin, as set forth in the affidavits of dozens of eyewitnesses and the statistical anomalies and mathematical impossibilities detailed in the affidavits of expert witnesses. *See* Exh. 19, Declaration of affiant presenting statistical analysis prediction of 105,639 fraudulent ballots cast for Joe Biden in the

City of Milwaukee and Exh. 17, Declaration of Russell James Ramsland, Jr. wherein he demonstrates it is statistically impossible for Joe Biden to have won Wisconsin.

2. The scheme and artifice to defraud was for the purpose of illegally and fraudulently manipulating the vote count to manufacture an election of Joe Biden as President of the United States, and also of various down ballot democrat candidates in the 2020 election cycle. The fraud was executed by many means, but the most fundamentally troubling, insidious, and egregious ploy was the systemic adaptation of old-fashioned "ballot-stuffing" techniques. *See* Exh. 16, U. S. Senator Elizabeth Warren (D. Mass.) letter of December 6, 2019 concerning the dangers of private equity control and censorship of election technology in the United States.

3. The fraud has now been amplified and rendered virtually invisible by computer software created and run by domestic and foreign actors for that very purpose. *See* Exh. 18, Joint Cybersecurity Advisory issued on October 30, 2020 by the U.S. Department of Justice Federal Bureau of Investigation (FBI) and the Cybersecurity & Infrastructure Security Agency (CISA) warning election officials about actual election system hacking events by Iranian agents in an attempt to manipulate the November 3, 2020 election. This Amended Complaint details an especially egregious range of conduct in Milwaukee County and the City of Milwaukee, along with Dane County, La Crosse County, Waukesha County, St. Croix County, Washington County, Bayfield County, Ozaukee County and various other counties throughout Wisconsin employing Dominion Systems, though this conduct occurred throughout the State at the direction of Wisconsin state election officials.

4. The multifaceted schemes and artifices implemented by Defendants and their collaborators to defraud resulted in the unlawful counting, or fabrication, of hundreds of thousands of illegal, ineligible, duplicate or purely fictitious ballots in the State of Wisconsin, that collectively

add up to multiples of Biden's purported lead in the State of 20,565 votes.

5. While this Amended Complaint, and the eyewitness and expert testimony incorporated herein, identify with specificity sufficient ballots required to set aside the 2020 General Election results, the entire process is so riddled with fraud, illegality, and statistical impossibility that this Court, and Wisconsin's voters, courts, and legislators, cannot rely on, or certify, any numbers resulting from this election. Accordingly, this Court must set aside the results of the 2020 General Election and grant the declaratory and injunctive relief requested herein.

Dominion Voting Systems Fraud and Manipulation

6. The fraud begins with the election software and hardware from Dominion Voting Systems Corporation ("Dominion") used by the Wisconsin Elections Commission. The Dominion systems derive from the software designed by Smartmatic Corporation, which became Sequoia in the United States.

7. Smartmatic and Dominion were founded by foreign oligarchs and dictators to ensure computerized ballot-stuffing and vote manipulation to whatever level was needed to make certain Venezuelan dictator Hugo Chavez never lost another election. See Exh. 1, Redacted Declaration of Dominion Venezuela Whistleblower ("Dominion Whistleblower Report") and Exh. 8, Statement by Ana Mercedes Diaz Cardozo outlining actual examples of election manipulation by hacking and misuse of technology in Venezuelan elections. Notably, Chavez "won" every election thereafter.

8. As set forth in the Dominion Whistleblower Report, the Smartmatic software was contrived through a criminal conspiracy to manipulate Venezuelan elections in favor of dictator Hugo Chavez:

> Importantly, I was a direct witness to the creation and operation of an electronic voting system in a conspiracy between a company known as Smartmatic and the

> leaders of conspiracy with the Venezuelan government. This conspiracy specifically involved President Hugo Chavez Frias, the person in charge of the National Electoral Council named Jorge Rodriguez, and principals, representatives, and personnel from Smartmatic. The purpose of this conspiracy was to create and operate a voting system that could change the votes in elections from votes against persons running the Venezuelan government to votes in their favor in order to maintain control of the government. In mid-February of 2009, there was a national referendum to change the Constitution of Venezuela to end term limits for elected officials, including the President of Venezuela. The referendum passed. This permitted Hugo Chavez to be re-elected an unlimited number of times. . . .
>
> Smartmatic's electoral technology was called "Sistema de Gestión Electoral" (the "Electoral Management System"). Smartmatic was a pioneer in this area of computing systems. Their system provided for transmission of voting data over the internet to a computerized central tabulating center. The voting machines themselves had a digital display, fingerprint recognition feature to identify the voter, and printed out the voter's ballot. The voter's thumbprint was linked to a computerized record of that voter's identity. Smartmatic created and operated the entire system. *Id.* ¶¶ 10 & 14.

9. A core requirement of the Smartmatic software design ultimately adopted by Dominion for Wisconsin's elections was the software's ability to hide its manipulation of votes from any audit. As the whistleblower explains:

> Chavez was most insistent that Smartmatic design the system in a way that the system could change the vote of each voter without being detected. He wanted the software itself to function in such a manner that if the voter were to place their thumb print or fingerprint on a scanner, then the thumbprint would be tied to a record of the voter's name and identity as having voted, but that voter would not tracked to the changed vote. He made it clear that the system would have to be setup to not leave any evidence of the changed vote for a specific voter and that there would be no evidence to show and nothing to contradict that the name or the fingerprint or thumb print was going with a changed vote. Smartmatic agreed to create such a system and produced the software and hardware that accomplished that result for President Chavez. *Id.* ¶15.

10. The design and features of the Dominion software do not permit a simple audit to reveal its misallocation, redistribution, or deletion of votes. First, the system's central accumulator does not include a protected real-time audit log that maintains the date and time stamps of all significant election events. Key components of the system utilize unprotected logs. Essentially this allows

an unauthorized user the opportunity to arbitrarily add, modify, or remove log entries, causing the machine to log election events that do not reflect actual voting tabulations—or more specifically, do not reflect the actual votes of or the will of the people.[1] *See* Exh. 14, Declaration of Ronald Watkins regarding manipulation of Dominion software and built-in optical ballot scanning systems to contrive an election outcome in multiple states.

11. This Amended Complaint will show that Dominion violated physical security standards by connecting voting machines to the Internet, allowing Dominion, domestic third parties or hostile foreign actors to access the system and manipulate election results, and moreover potentially to cover their tracks due to Dominion's unprotected log. Accordingly, a thorough forensic examination of Dominion's machines and source code (pursuant to Wisconsin Statute § 5.905) is required to document these instances of voting fraud, as well as Dominion's systematic violations of the Voting Rights Act record retention requirements through manipulation, alteration, destruction and likely foreign exfiltration of voting records. *See* 52 U.S.C. § 20701.

12. These and other problems with Dominion's software have been widely reported in the press and been the subject of investigations. In certifying Dominion Voting Systems Democracy Suite, Wisconsin officials disregarded all the concerns that caused Dominion software to be rejected by the Texas Board of elections in 2020 because it was deemed vulnerable to undetected and non-auditable manipulation. Texas denied Certification because of concerns that it was not safe from fraud or unauthorized manipulation. *See* Exh. 11.

13. An industry expert, Dr. Andrew Appel, Princeton Professor of Computer Science and

[1] *See* Ex. 7, August 24, 2020 Declaration of Harri Hursti, ¶¶45-48 (expert testimony in Case 1:17-cv-02989 in the U.S. District Court for the Northern District of Georgia). The Texas Secretary of State refused to certify Dominion for similar reasons as those cited by Mr. Hursti. *See* Ex. 9, State of Texas Secretary of State, Elections Division, Report of Review of Dominion Voting Systems Democracy Suite 5.5-A at 2 (Jan. 24, 2020).

Election Security Expert has recently observed, with reference to Dominion Voting machines: "I figured out how to make a slightly different computer program that just before the polls were closed, it switches some votes around from one candidate to another. I wrote that computer program into a memory chip and now to hack a voting machine you just need 7 minutes alone with a screwdriver."[2]

14. In addition to the Dominion computer fraud, this Amended Complaint identifies several additional categories of "traditional" voting fraud that occurred as a direct result of Defendant Wisconsin Election Commission ("WEC") and other Defendants directing Wisconsin clerks and other election officials to ignore or violate the express requirements of the Wisconsin Election Code. First, the WEC issued "guidance" to county and municipal clerks not to reject "indefinitely confined" absentee voters, even if the clerks possess "reliable information" that the voter is no longer indefinitely confined, in direct contravention of Wisconsin Statute § 6.86(2)(6), which states that clerks must remove such voters. Second, the WEC issued further guidance directing clerks – in violation of Wisconsin Statute § 6.87(6)(d), which states that an absentee envelope certification "is missing the address of a witness, the ballot may not be counted" – to instead fill in the missing address information.

15. This Amended Complaint presents expert witness testimony demonstrating that several hundred thousand illegal, ineligible, duplicate or purely fictitious votes must be thrown out, in particular:

A. A report from Dr. William Briggs, showing that there were approximately 29,594 absentee ballots listed as "unreturned" by voters that either never requested them, or that requested and returned their ballots;

B. Reports from Redacted Expert Witnesses who can show an algorithm was used

[2] Andrew W. Appel, *et al.*, "Ballot Marking Devices (BMDs) Cannot Assure the Will of the Voters" at (Dec. 27, 2019),(attached hereto as Exh. 10 ("Appel Study")).

to pick a winner.

16. In the accompanying redacted declaration of a former electronic intelligence analyst with 305th Military Intelligence with experience gathering SAM missile system electronic intelligence, the Dominion software was accessed by agents acting on behalf of China and Iran in order to monitor and manipulate elections, including the most recent US general election in 2020. *See* Exh. 12 (copy of redacted witness affidavit).

17. These and other "irregularities" demonstrate that at least 318,012 illegal ballots were counted in Wisconsin. This provides the Court with sufficient grounds to set aside the results of the 2020 General Election and provide the other declaratory and injunctive relief requested herein.

JURISDICTION AND VENUE

18. This Court has subject matter under 28 U.S.C. § 1331 which provides, "The district courts shall have original jurisdiction of all civil actions arising under the Constitution, laws, or treaties of the United States."

19. This Court also has subject matter jurisdiction under 28 U.S.C. § 1343 because this action involves a federal election for President of the United States. "A significant departure from the legislative scheme for appointing Presidential electors presents a federal constitutional question." *Bush v. Gore*, 531 U.S. 98, 113 (2000) (Rehnquist, C.J., concurring); *Smiley v. Holm*, 285 U.S. 355, 365 (1932).

20. The jurisdiction of the Court to grant declaratory relief is conferred by 28 U.S.C. §§ 2201 and 2202 and by Rule 57, Fed. R. Civ. P.

21. This Court has jurisdiction over the related Wisconsin constitutional claims and state-law claims under 28 U.S.C. § 1367.

22. Venue is proper because a substantial part of the events or omissions giving rise to the

claim occurred in the Eastern District. 28 U.S.C. § 1391(b) & (c).

23. Because the United States Constitution reserves for state legislatures the power to set the time, place, and manner of holding elections for the President, state executive officers have no authority to unilaterally exercise that power, much less flout existing legislation.

THE PARTIES

24. Plaintiff William Feehan, is a registered Wisconsin voter and a nominee of the Republican Party to be a Presidential Elector on behalf of the State of Wisconsin. Mr. Feehan is a resident of the City of La Crosse and La Crosse County, Wisconsin.

25. Presidential Electors "have a cognizable interest in ensuring that the final vote tally reflects the legally valid votes cast," as "[a]n inaccurate vote tally is a concrete and particularized injury to candidates such as the Electors." *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020) (affirming that Presidential Electors have Article III and prudential standing to challenge actions of state officials implementing or modifying State election laws); *see also McPherson v. Blacker*, 146 U.S. 1, 27 (1892); *Bush v. Palm Beach Cty. Canvassing Bd.*, 531 U.S. 70, 76 (2000) (per curiam).

26. Plaintiff Feehan has standing to bring this action as a voter and as a candidate for the office of Elector under Wis. Stat. §§ 5.10, et seq (election procedures for Wisconsin electors). As such, Presidential Electors "have a cognizable interest in ensuring that the final vote tally reflects the legally valid votes cast," as "[a]n inaccurate vote tally is a concrete and particularized injury to candidates such as the Electors." *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020) (affirming that Presidential Electors have Article III and prudential standing to challenge actions of state officials in implementing or modifying State election laws); *see also McPherson v. Blacker*, 146 U.S. 1, 27 (1892); *Bush v. Palm Beach Cty. Canvassing Bd.*, 531 U.S. 70, 76 (2000)

(per curiam).

27. Plaintiff brings this action to prohibit certification of the election results for the Office of President of the United States in the State of Wisconsin and to obtain the other declaratory and injunctive relief requested herein. Those results were certified by Defendants on November 30, 2020, indicating a plurality for Mr. Biden of 20,565 votes out of 3,240,867 cast.

28. The Defendants are Wisconsin Elections Commission ("WEC"), a state agency, and its members Ann S. Jacobs, Mark L. Thomsen, Marge Bostelman, Julie M. Glancey, Dean Knudson, and Robert F. Spindell, Jr., in their official capacities

29. Defendant Governor Tony Evers is named as a defendant in his official capacity as Wisconsin's governor.

30. Defendant WEC was created in 2015 by the Wisconsin Legislature as an independent agency under the Executive branch to administer Wisconsin's election laws. Wis. Stat. §§ 5.03 & 15.61. The WEC is authorized to adopt administrative rules pursuant to Chapter 227 of the Wisconsin Statutes, but nothing under Wisconsin's election laws authorizes the WEC to issue any documents, make any oral determinations or instruct governmental officials administering elections to perform any act contrary to Wisconsin law governing elections.

31. Furthermore, the Wisconsin Legislature also created municipal elections commissions for municipalities with a population greater than 500,000 and a county elections commissions for counties with a population greater than 750,000. Wis Stat. § 7.20. As a result, the City of Milwaukee Elections Commission was created as well as the Milwaukee County Elections Commission and the Dane County Elections Commission. These county and municipal elections commissions are responsible for administering the elections in their respective jurisdictions.

STATEMENT OF FACTS

32. Plaintiff brings this action under 42 U.S.C. §§ 1983 and 1988, to remedy deprivations of rights, privileges, or immunities secured by the Constitution and laws of the United States and to contest the election results, and the corollary provisions under the Wisconsin Constitution.

33. The United States Constitution sets forth the authority to regulate federal elections. With respect to the appointment of presidential electors, the Constitution provides:

> Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress: but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.
>
> U.S. CONST. art. II, § 1 ("Electors Clause").

34. None of Defendants is a "Legislature" as required under the Elections Clause or Electors Clause to set the rules governing elections. The Legislature is "'the representative body which ma[kes] the laws of the people.'" *Smiley*, 285 U.S. 365. Regulations of presidential elections, thus, "must be in accordance with the method which the state has prescribed for legislative enactments." *Id.* at 367; *see also Ariz. State Legislature v. Ariz. Indep. Redistricting Comm'n*, 576 U.S. 787, 135 S. Ct. 2652, 2668 (U.S. 2015).

35. The WEC certified the Presidential Election results on November 30, 2020. The Presidential election results in Wisconsin show a difference of 20,565 "tallied" votes in favor of former Vice-President Joe Biden over President Trump.

36. Based upon all the allegations of fraud, statutory violations, and other misconduct, as stated herein and in the attached affidavits, it is necessary to enjoin the certification of the election results pending a full investigation and court hearing, and to order an independent audit of the November 3, 2020 election to ensure the accuracy and integrity of the election.

I. VIOLATIONS OF WISCONSIN ELECTION CODE

A. WEC Directed Clerks to Violate Wisconsin Election Code Requirements for Absentee Voting by "Indefinitely Confined" without Photo ID.

37. The Wisconsin State Legislature adopted Act 23 in 2011 to require Wisconsin electors to present an identification containing a photograph, such as a driver's license, to either a municipal or county clerk, when registering to vote and when voting. Wis. Stat. §§ 6.34; 6.79 (2). The Wisconsin State Legislature adopted the photo ID requirement to deter the casting of ballots by persons either not eligible to vote or persons fraudulently casting multiple ballots. *League of Women Voters of Wisconsin Education Network, Inc. v. Walker,* 851 N.W.2d 302, 314 (Wis. 2014).

38. Wisconsin's absentee voting is governed by Wisconsin Statutes § 6.84 - § 6.89. Under Wisconsin Statutes §6.86, every absentee elector applicant must present a photo ID when registering to vote absentee except absentee voters who registered as "indefinitely confined," Wis. Stat. §6.86 (ac), meaning someone confined "because of age, physical illness or infirmity or is disabled for an indefinite period." Wis. Stat. § 6.86(2)(a). As a result, Wisconsin election procedures for voting absentee based on "indefinitely confined" status circumvent the photo ID requirement, creating an avenue for fraudulent voting.

39. In order to ensure that only those who are "indefinitely confined" may use the "indefinitely confined" absentee ballot in an election, Wisconsin Statutes §6.86 provides that any elector who files an application for an absentee ballot based on indefinitely confined status may not use the absentee ballot if the electoral is no longer "indefinitely confined." Wisconsin Statutes § 6.86 (2)(b) further provides that the municipal clerk "shall remove the name of any other elector from the list upon request of the elector or upon receipt of reliable information that an elector no longer qualifies for the service."

40. Despite this clear statutory requirement, the Administrator of the Wisconsin Election

Commission, Meagan Wolfe, issued a written directive on May 13, 2020 to the clerks across the State of Wisconsin stating that the clerks cannot remove an allegedly "indefinitely confined" absentee voter from the absentee voter register if the clerk had "reliable information" that an allegedly "indefinitely confined" absentee voter is no longer "indefinitely confined." The directive specifically stated:

> Can I deactivate an absentee request if I believe the voter is not indefinitely confined? No. All changes to status must be made in writing and by the voter's request. Not all medical illnesses or disabilities are visible or may only impact the voter intermittently. (*See* WEC May 13, 2020 Guidance Memorandum).

41. The WEC's directive thus directly contradicts Wisconsin law, which specifically provides that clerks "shall" remove an indefinitely confined voter from the absentee voter list if the clerk obtains "reliable information" that the voter is no longer indefinitely confined.

42. As a result of the directive, clerks did not remove from the absentee voter lists maintained by their jurisdictions the absentee voters who claimed "indefinitely confined" status but who in fact were no longer "indefinitely confined." This resulted in electors who were allegedly "indefinitely confined" absentee voters casting ballots as "indefinitely confined" absentee voters who were not actually "indefinitely confined" absentee voters.

B. WEC Directed Clerks to Violate Wisconsin Law Prohibiting Counting of Absentee Ballot Certificates Missing Witness Addresses.

43. In 2015, the Wisconsin Legislature passed Act 261, amending Wisconsin's election laws, including a requirement, codified as Wisconsin Statute § 6.87(d), that absentee ballots include both elector and witness certifications, which must include the address of the witness. If the address of the witness is missing from the witness certification, however, "the ballot may not be counted." *Id.*

44. On October 18, 2016, WEC reacted to this legislation by issuing a memorandum, which,

among other things, permitted clerks to write in the witness address onto the absentee ballot certificate itself, effectively nullifying this express requirement. (*See* WEC October 18, 2016 Guidance Memorandum). Wisconsin election officials reiterated this unlawful directive in publicly posted training videos. For example, in a Youtube video posted before the November 3, 2020 General Election by Clarie Woodall-Voog of the Milwaukee Elections Commission, Ms. Woodall-Voog advised clerks that missing items "like witness address may be written in red."[3]

C. WEC Directed Clerks to Illegally Cure Absentee Ballots by Filling in Missing Information on Absentee Ballot Certificates and Envelopes.

45. On October 19, 2020, WEC instructed its clerks that, without any legal basis in the Wisconsin Election Code, they could simply fill in missing witness or voter certification information using, e.g., personal knowledge, voter registration information, or calling the voter or witness. The WEC further advised that voters or witnesses could cure any missing information at the polling place, again without citing any authority to do so under Wisconsin Election Code.

II. EXPERT WITNESS TESTIMONY: EVIDENCE OF WIDESPREAD VOTER FRAUD

A. Approximately 15,000 Wisconsin Mail-In Ballots Were Lost, and Approximately 18,000 More Were Fraudulently Recorded for Voters who Never Requested Mail-In Ballots.

46. The attached report of William M. Briggs, Ph.D., Exh. 2 ("Dr. Briggs Report") summarizes the multi-state phone survey that includes a survey of Wisconsin voters collected by Matt Braynard, which was conducted from November 15-17, 2020. *See* Exh. 3 ("Braynard Survey"). The Briggs analysis identified two specific errors involving unreturned mail-in ballots that are indicative of voter fraud, namely: "**Error #1:** those who were recorded as receiving absentee ballots ***without*** requesting them;" and "**Error #2:** those who returned absentee ballots

[3] *See* https://www.youtube.com/watch?v=hbm-pPaYiqk (video a 10:43 to 11:07).

but whose votes went missing (*i.e.*, marked as unreturned)." Exh. 2. Dr. Briggs then conducted a parameter-free predictive model to estimate, within 95% confidence or prediction intervals, the number of ballots affected by these errors out of a total of 96,771 unreturned mail-in ballots for the State of Wisconsin.

47. With respect to **Error #1**, Dr. Briggs' analysis estimated that **16,316-19,273 ballots** out of the total 96,771 unreturned ballots were recorded for voters who had **not** requested them. *Id.* With respect to **Error #2**, he found **13,991 – 16,757 ballots** out of 96,771 unreturned ballots recorded for voters who **did return their ballots were recorded as being unreturned.** *Id.* Taking the average of the two types of errors together, **29,594 ballots, or 31% of the total, are "troublesome."**

48. These errors are not only conclusive evidence of widespread fraud by the State of Wisconsin, but they are fully consistent with the fact witness statements cited above regarding the evidence about Dominion presented below insofar as **these unreturned absentee ballots represent a pool of blank ballots that could be filled in by third parties to shift the election to Joe Biden,** and also present the obvious conclusion that there must be absentee ballots unlawfully ordered by third parties that were returned.

49. With respect to **Error #1**, Dr. Briggs' analysis demonstrates that approximately **17,795 absentee ballots were sent to someone besides the registered voter named in the request**, and thus could have been filled out by anyone and then submitted in the name of another voter. Regarding ballots ordered by third parties that were voted, those would no longer be in the unreturned pool and therefore cannot be estimated from this data set.

50. With respect to **Error #2**, Dr. Briggs' analysis indicates that approximately **15,374 absentee ballots were either lost or destroyed** (consistent with allegations of Trump ballot

destruction) **and/or were replaced with blank ballots filled out by election workers, Dominion or other third parties.** Dr. Briggs' analysis shows that 31% of "unreturned ballots" suffer from one of the two errors above – which is consistent with his findings in the four other States analyzed (Arizona 58%, Georgia 39%, Pennsylvania 37%, and Wisconsin 45%) – and provides further support that these widespread "irregularities" or anomalies were one part of a much larger multi-state fraudulent scheme to rig the 2020 General Election for Joe Biden.

B. Nearly 7,000 Ineligible Voters Who Have Moved Out-of-State Illegally Voted in Wisconsin.

51. Evidence compiled by Matt Braynard using the National Change of Address ("NCOA") Database shows that 6,207 Wisconsin voters in the 2020 General Election moved out-of-state prior to voting, and therefore were ineligible. Exh. 3. Mr. Braynard also identified 765 Wisconsin voters who subsequently registered to vote in another state and were therefore ineligible to vote in the 2020 General Election. The merged number is 6,966 ineligible voters whose votes must be removed from the total for the 2020 General Election.[4] *Id.*

C. A Statistical Study Reveals that Biden Overperformed in those Precincts that Relied on Dominion Voting Machines

52. From November 13th, 2020 through November 28th, 2020, the Affiant conducted in-depth statistical analysis of publicly available data on the 2020 U.S. Presidential Election. This data included vote counts for each county in the United States, U.S. Census data, and type of voting machine data provided by the U.S. Election Assistance Committee. The Affiant's analysis yielded several "red flags" concerning the percentage of votes won by candidate Biden in counties using voting machines provided by Dominion Voting Systems. These red flags occurred in several

[4] Mr. Braynard posted the results of his analysis on Twitter. *See* https://twitter.com/MattBraynard/status/1329700178891333634?s=20. This Complaint includes a copy of his Report, (attached hereto as Exh. 3).

States in the country, including Wisconsin. (*See* attached hereto as Exh. 4, copy of redacted Affiant, B.S. Mathematics and M.S. Statistics).

53. The Affiant began by using Chi-Squared Automatic Interaction Detection (CHAID), which treats the data in an agnostic way—that is, it imposes no parametric assumptions that could otherwise introduce bias. Affiant posed the following question: "Do any voting machine types appear to have unusual results?" The answer provided by the statistical technique/algorithm was that machines from Dominion Voting Systems (Dominion) produced abnormal results. *Id.*

54. Subsequent graphical and statistical analysis shows the unusual pattern involving machines from Dominion occurs in at least 100 counties and multiple States, including Wisconsin. The results from the vast majority of counties using the Dominion machines is 3 to 5.6 percentage points higher in favor of candidate Biden. This pattern is seen easily in graphical form when the results from "Dominion" counties are overlaid against results from "non-Dominion" counties. The results from "Dominion" counties do not match the results from the rest of the counties in the United States. The results are clearly statistically significant, with a p-value of < 0.00004. This translates into a statistical impossibility that something unusual involving Dominion machines is *not* occurring. This pattern appears in multiple States, including Wisconsin, and the margin of votes implied by the unusual activity would easily sway the election results. *Id.*

55. The following graph shows the pattern. The large red dots are counties in Wisconsin that use Dominion voting machines. Almost all of them are above the blue prediction line, when in normal situations approximately half of them would be below the prediction line (as evidence by approximately half the counties in the U.S. (blue dots) that are below the blue centerline). The p-value of statistical analysis regarding the centerline for the red dots (Wisconsin counties with Dominion machines) is 0.000000049, pointing to a statistical impossibility that this is a "random"

statistical anomaly. Some external force caused this anomaly:

Id.

56. To confirm that Dominion machines were the source of the pattern/anomaly, Affiant conducted further analysis using propensity scoring using U.S. census variables (including ethnicities, income, professions, population density and other social/economic data) , which was used to place counties into paired groups. Such an analysis is important because one concern could be that counties with Dominion systems are systematically different from their counterparts, so abnormalities in the margin for Biden are driven by other characteristics unrelated to the election. *Id.*

57. After matching counties using propensity score analysis, the only difference between the groups was the presence of Dominion machines. This approach again showed a highly statistically

significant difference between the two groups, with candidate Biden again averaging three percentage points higher in Dominion counties than in the associated paired county. The associated p-value is < 0.00005, against indicating a statistical impossibility that something unusual is not occurring involving Dominion machines. *Id.*

58. The results of the analysis and the pattern seen in the included graph strongly suggest a systemic, system-wide algorithm was enacted by an outside agent, causing the results of Wisconsin's vote tallies to be inflated by somewhere between three and five point six percentage points. **Statistical estimating yields that in Wisconsin, the best estimate of the number of impacted votes is 181,440.** *Id.*

59. The summation of sections A through C above provide the following conclusions for the reports cited above, respectively.

- returned ballots that were deemed unreturned by the state: 15,374
- unreturned mail ballots unlawfully ordered by third parties: 17,795
- votes by persons that moved out of state or subsequently registered to vote in another state for the 2020 election: 6,966
- Votes that were improperly relying on the "indefinitely confined" exemption to voter ID: 96,437
- And excess votes arising from the statistically significant outperformance of Dominion machines on behalf of Joe Biden: 181,440

In Conclusion, the Reports cited above show a total amount of illegal votes identified that amount to 318,012 or over 15 times the margin by which candidate Biden leads President Trump in the state of Wisconsin.

III. FACTUAL ALLEGATIONS REGARDING DOMINION VOTING SYSTEMS

60. The State of Wisconsin, in many locations, used either Sequoia, a subsidiary of Dominion Systems, and or Dominion Systems, Democracy Suite 4.14-D first, and then included Dominion

Systems Democracy Suite 5.0-S on or about January 27, 2017, which added a fundamental modification: "dial-up and wireless results transmission capabilities to the ImageCast Precinct and results transmission using the Democracy Suite EMS Results Transfer Manager module." (*See* Exh. 5, attached hereto, a copy of the Equipment for WI election systems).

A. Dominion's Results for 2020 General Election Demonstrate Dominion Manipulated Election Results.

61. Affiant Keshel's findings that reflect the discussion cited above:

> While Milwaukee County is focal for transparency and observation violations, including reporting statistically impossible vote counts in the early morning hours away from scrutiny, Dane County has surged far past support totals for President Obama, despite expected difficulties mobilizing student voters to polls. President Trump has reconsolidated the Republican base in suburban Milwaukee and far surpassed his 2016 support levels but has been limited in margin growth by historically improbable Democratic support in these strongholds, which defy years of data in Wisconsin in which the Republican party surged as the Democratic Party plunged. Finally, in strong Trump counties showing a double inversion cycle (one party up, the other down), particularly in rural and exurban Wisconsin, Trump's totals are soaring, and against established trends, Biden's totals are at improbable levels of support despite lacking registration population
> (*See* attached hereto, Exh. 9, Aff. of Seth Keshel, MBA)

County	Rep '08	Dem '08	Rep '12	Dem '12	Rep '16	Dem '16	Rep '20	Dem '20	Dem Percentage of Obama 2008 Votes
Ozaukee	32,172	20,579	36,077	19,159	30,464	20,170	33,912	26,515	128.8%
% Increase	N/A	N/A	12.1%	(6.9%)	(15.6%)	5.3%	11.3%	31.5%	

Dane	73,065	205,984	83,644	216,071	71,275	217,697	78,789	260,157	126.3%
% Increase	N/A	N/A	14.5%	4.9%	(14.8%)	0.8%	10.5%	19.5%

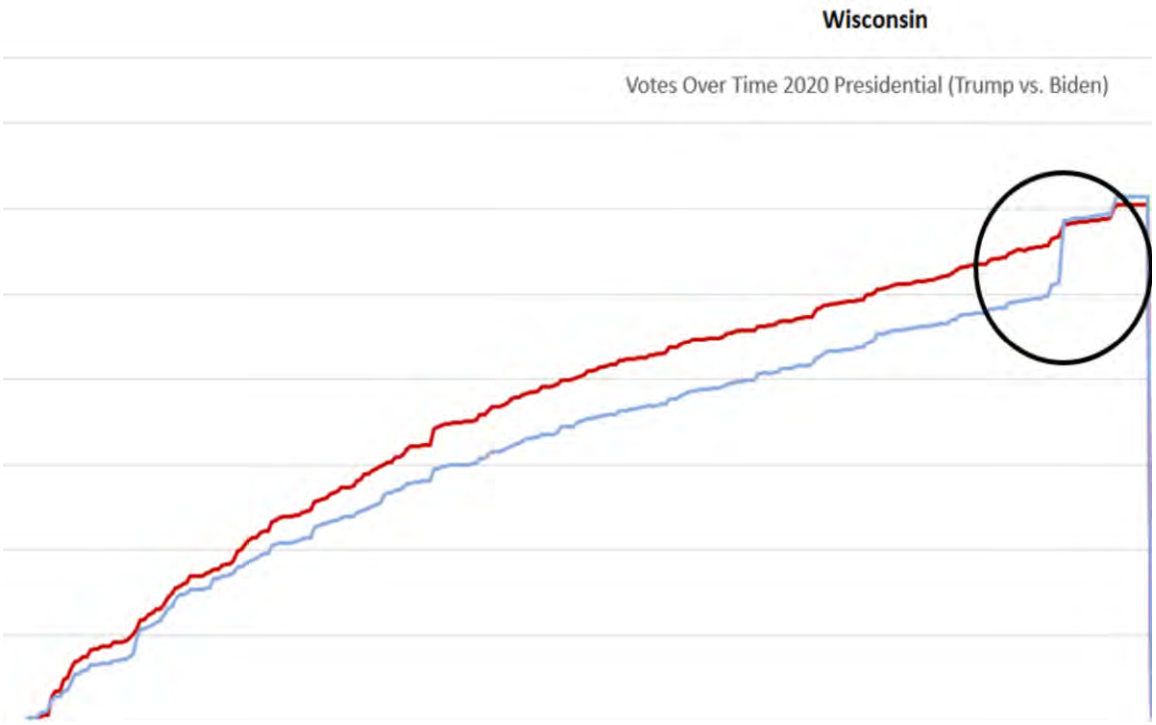
% Increase	N/A	N/A	7.4%	(0.7%)	(5.4%)	(19.6%)	16.7%	17.6%	

Id.

62. Keshel provides a graph reflecting the voter returns in a time-series. The highly unlikely

and remarkably convenient attainment of this block of votes provides for a stunning depiction of the election and generates many questions. The analysis provided by Plaintiff's multiple experts, including data, statistics and cyber, will reveal clear evidence of the multiple frauds that combined to change the outcome of the 2020 election.



See Id.

B. Administrative and Judicial Decisions Regarding Dominion's Security Flaws.

63. **Wisconsin.** In 2018, Jill Stein was in litigation with Dominion Voting Systems ("DVS") after her 2016 recount request pursuant to WISCONSIN STAT.§5.905(4) wherein DVS obtained a Court Order requiring confidentiality on information including *voting counting source code*, which Dominion claims is proprietary – and must be kept secret from the public. (*See* unpublished decision, Wisconsin Court of Appeals, No. 2019AP272 issued April 30, 2020). Rather than engaging in an open and transparent process to give credibility to Wisconsin's

Dominion-Democracy Suite voting system, the processes were hidden during the receipt, review, opening, and tabulation of those votes in direct contravention of Wisconsin's Election Code and Federal law.

64. **Texas.** The same Dominion Democracy Suite was denied certification in Texas by the Secretary of State on January 24, 2020, specifically because the "examiner reports raise concerns about whether Democracy Suite 5.5-A system … **is safe from fraudulent or unauthorized manipulation**."[5]

65. **Georgia.** Substantial evidence of this vulnerability was discussed in Judge Amy Totenberg's October 11, 2020 Order in the USDC N.D. Ga. case of *Curling, et al. v. Kemp, et. al*, Case No. 1:17-cv-02989 Doc. No. 964. *See*, p. 22-23 ("This array of experts and subject matter specialists provided a huge volume of significant evidence regarding the security risks and deficits in the system as implemented in both witness declarations and live testimony at the preliminary injunction hearing."); p. 25 ("In particular, Dr. Halderman's testing indicated the practical feasibility through a cyber attack of causing the swapping or deletion of specific votes cast and the compromise of the system through different cyber attack strategies, including through access to and alteration or manipulation of the QR barcode.") The full order should be read, for it is eye-opening and refutes many of Dominion's erroneous claims and talking points.

66. A District Judge found that Dominion's BMD ballots are not voter verifiable, and they cannot be audited in a software independent way. The credibility of a BMD ballot can be no greater than the credibility of Dominion's systems, which copious expert analysis has shown is deeply compromised. Similar to the issues in Wisconsin, Judge Totenberg of the District Court of Georgia

[5] See attached hereto, as Exh. 11, State of Texas Secretary of State, Elections Division, *Report of Review of Dominion Voting Systems Democracy Suite 5.5-A* at 2 (Jan. 24, 2020) (emphasis added).

Northern District held:

> Georgia's Election Code mandates the use of the BMD system as the uniform mode of voting for all in-person voters in federal and statewide elections. O.C.G.A. § 21-2-300(a)(2). The statutory provisions mandate voting on "electronic ballot markers" that: (1) use "electronic technology to independently and privately mark a paper ballot at the direction of an elector, interpret ballot selections, ... such interpretation **for elector verification**, and print **an elector verifiable paper ballot**;" and (2) "produce paper ballots which are marked with the elector's choices **in a format readable by the elector**" O.C.G.A. § 21-2-2(7.1); O.C.G.A. § 21-2-300(a)(2). Plaintiffs and other voters who wish to vote in-person are required to vote on **a system that does none of those things**. Rather, the evidence shows that the Dominion BMD system does **not produce a voter-verifiable paper ballot or a paper ballot marked with the voter's choices in a format readable by the voter because the votes are tabulated solely from the unreadable QR code**.
>
> *See* Order, pp. 81-82. (Emphasis added).

67. This case was later affirmed in a related case, in the Eleventh Circuit in 2018 related to Georgia's voting system in *Common Cause Georgia v. Kemp*, 347 F. Supp. 3d 1270 (11th Cir. 2018). The Court found,

> **In summary, while further evidence will be necessary in the future, the Court finds that the combination of the statistical evidence and witness declarations in the record here (and the expert witness evidence in the related *Curling* case which the Court takes notice of) persuasively demonstrates the likelihood of Plaintiff succeeding on its claims. Plaintiff has shown a substantial likelihood of proving that the Secretary's failure to properly maintain a reliable and secure voter registration system has and will continue to result in the infringement of the rights of the voters to cast their vote and have their votes counted.**
>
> *Id.at* 1294-1295.

68. The expert witness in the above litigation in the United States District Court of Georgia, Case 1:17-cv-02989-AT, Harri Hursti, specifically testified to the acute security vulnerabilities, *see* Exh. 107, wherein he testified or found:

> A. "The scanner and tabulation software settings being employed to determine which votes to count on hand marked paper ballots are likely causing clearly intentioned votes to be counted" "The voting system is being operated in Fulton County in a manner that escalates

the security risk to an extreme level" "Votes are not reviewing their BMD printed ballots, which causes BMD generated results to be un-auditable due to the untrustworthy audit trail." 50% or more of voter selections in some counties were visible to poll workers. Dominion employees maintain near exclusive control over the EMS servers. "In my professional opinion, the role played by Dominion personnel in Fulton County, and other counties with similar arrangements, should be considered an elevated risk factor when evaluating the security risks of Georgia's voting system." *Id.* ¶26.

B. A video game download was found on one Georgia Dominion system laptop, suggesting that multiple Windows updates have been made on that respective computer.

C. There is evidence of remote access and remote troubleshooting which presents a grave security implication.

D. Certified identified vulnerabilities should be considered an "extreme security risk."

E. There is evidence of transfer of control the systems out of the physical perimeters and place control with a third party off site.

F. USB drives with vote tally information were observed to be removed from the presence of poll watchers during a recent election.

G. "The security risks outlined above – operating system risks, the failure to harden the computers, performing operations directly on the operating systems, lax control of memory cards, lack of procedures, and potential remote access are extreme and destroy the credibility of the tabulations and output of the reports coming from a voting system." *Id.* ¶49.

C. Foreign Interference/Hacking and/or Manipulation of Dominion Results.

1. Evidence of Vulnerability to Foreign Hackers.

69. In October of 2020 The FBI and CISA issued a JOINT CYBERSECURITY ADVISORY ON October 30, 2020 titled: **Iranian Advanced Persistent Threat Actor Identified Obtained Voter Registration Data**

This joint cybersecurity advisory was coauthored by the Cybersecurity and Infrastructure Security Agency (CISA) and the Federal Bureau of Investigation (FBI). CISA and the FBI are aware of an Iranian advanced persistent threat (APT)

> actor targeting U.S. state websites to include election websites. CISA and the FBI assess this actor is responsible for the mass dissemination of voter intimidation emails to U.S. citizens and the dissemination of U.S. election-related disinformation in mid-October 2020.[1] (Reference FBI FLASH message ME-000138-TT, disseminated October 29, 2020). Further evaluation by CISA and the FBI has identified the targeting of U.S. state election websites was an intentional effort to influence and interfere with the 2020 U.S. presidential election.

(*See* CISA and FBI Joint Cyber Security Advisory of October 30, 2020, a copy attached hereto as Exh. 18.)

70. An analysis of the Dominion software system by a former US Military Intelligence expert subsequently found that the Dominion Voting system and software are accessible - and was compromised by rogue actors, including foreign interference by Iran and China. (*See* Exh. 12, Spider Declaration, (who remains redacted for security reasons).)

71. The expert does an analysis and explains how by using servers and employees connected with rogue actors and hostile foreign influences combined with numerous easily discoverable leaked credentials, Dominion allowed foreign adversaries to access data and intentionally provided access to Dominion's infrastructure in order to monitor and manipulate elections, including the most recent one in 2020. (*See* Exh. 12, Spider Declaration. Several facts are set forth related to foreign members of Dominion Voting Systems and foreign servers as well as foreign interference.).

72. Another Declarant first explains the foundations of her opinion and then addresses the concerns of foreign interference in our elections through hardware components from companies based in foreign countries with adverse interests. She explains that Dominion Voting Systems works with SCYTL, and that votes on route, before reporting, go to SCYTL in foreign countries. On the way, they get mixed and an algorithm is applied, which is done through a secretive process.

> The core software used by ALL SCYTL related Election Machine/Software manufacturers ensures "anonymity" Algorithms within the area of this "shuffling"

> to maintain anonymity allows for setting values to achieve a desired goal under the guise of "encryption" in the trap-door…
>
> (*See* Exh. 13, Aff. of Computer analysis, at par. 32).

73. The Affiant goes on to explain the foreign relationships in the hardware used by Dominion Voting Systems and its subsidiary Sequoia and explains specifically the port that Wisconsin uses, which is called Edge Gateway and that is a part of Akamai Technologies based in Germany:

> "Wisconsin has EDGE GATEWAY port which is AKAMAI TECHNOLOGIES based out of GERMANY. Using AKAMAI Technologies is allowing .gov sites to obfuscate and mask their systems by way of HURRICANE ELECTRIC (he.net)"

74. This Declarant further explains the foundations of her opinion and then addresses the concerns of foreign interference in our elections through hardware components from companies based in foreign countries with adverse interests.

> The concern is the HARDWARE and the NON – ACCREDITED VSTLs as by their own admittance use COTS. The purpose of VSTL's being accredited and their importance is ensuring that there is no foreign interference / bad actors accessing the tally data via backdoors in equipment software. The core software used by ALL SCYTL related Election Machine/Software manufacturers ensures "anonymity". **Algorithms within the area of this "shuffling" to maintain anonymity allows for setting values to achieve a desired goal under the guise of "encryption" in the trap-door…**
>
> (*See Id.* at ¶32).

75. This Declarant goes on to explain the foreign relationships in the hardware used by Dominion Voting Systems and its subsidiary Sequoia and specifically the port that Wisconsin uses:

> "Wisconsin has EDGE GATEWAY port which is AKAMAI TECHNOLOGIES based out of GERMANY. Using AKAMAI Technologies is allowing .gov sites to obfuscate and mask their systems by way of HURRICANE ELECTRIC (he.net) Kicking it to anonymous (AKAMAI Technologies) offshore servers.
> Wisconsin Port.
>
> China is not the only nation involved in COTS provided to election machines or the networking but so is Germany via a LAOS founded Chinese linked cloud service

company that works with SCYTL named Akamai Technologies that have offices in China and are linked to the server [for] Dominion Software.

(*See Id.* at par. 21).

76. The Affiant explains the use of an algorithm and how it presents throughout the statement, but specifically concludes that,

> **The "Digital Fix" observed with an increased spike in VOTES for Joe Biden can be determined as evidence of a pivot**. Normally it would be assumed that the algorithm had a Complete Pivot. Wilkinson's demonstrated the guarantee as:
>
> $$\frac{\|U\|_\infty}{\|A\|_\infty} \leq n^{\frac{1}{2}\log(n)}$$
>
> Such a conjecture allows the growth factor the ability to be upper bound by values closer to n. Therefore, complete pivoting can't be observed because there would be too many floating points. Nor can partial as the partial pivoting would overwhelm after the "injection" of votes. Therefore, external factors were used which is evident from the "DIGITAL FIX." (*See Id.* at pars. 67-69)
>
> "The algorithm looks to have been set to give Joe Biden a 52% win even with an initial 50K+ vote block allocation was provided initially as tallying began (as in case of Arizona too). In the am of November 4, 2020 the algorithm stopped working, therefore another "block allocation" to remedy the failure of the algorithm. This was done manually as ALL the SYSTEMS shut down NATIONWIDE to avoid detection."
>
> (*See Id.* at par. 73)

2. Background of Dominion Connections to Smartmatic and Hostile Foreign Governments.

77. An expert analysis by Russ Ramsland agrees with the data reflecting the use of an algorithm that causes the spike in the data feed, which is shown to be an injection of votes to change the outcome, because natural reporting does not appear in such a way.

78. And Russ Ramsland can support that further by documenting the data feed that came from Dominion Voting Systems to Scytl -- and was reported with decimal points, which is contrary to one vote as one ballot: **"The fact that we observed raw vote data coming directly that includes**

decimal places establishes selection by an algorithm, and not individual voter's choice. Otherwise, votes would be solely represented as whole numbers (votes cannot possibly be added up and have decimal places reported)."

79. The report concludes that **"**Based on the foregoing, I believe these statistical anomalies and impossibilities compels the conclusion to a reasonable degree of professional certainty that the vote count in Wisconsin, in particular for candidates for President contain at least 119,430 (Para. 13) up to 384,085 (Para. 15) illegal votes that must be disregarded. In my opinion, it is not possible at this time to determine the true results of the Wisconsin vote for President of the United States."

The History of Dominion Voting Systems

80. Plaintiff can also show Smartmatic's incorporation and inventors who have backgrounds evidencing their foreign connections, including Serbia, specifically its identified inventors:

> Applicant: SMARTMATIC, CORP.
>
> Inventors**:** Lino Iglesias, Roger Pinate, Antonio Mugica, Paul Babic, Jeffrey Naveda, Dany Farina, Rodrigo Meneses, Salvador Ponticelli, Gisela Goncalves, Yrem Caruso[6]

81. Another Affiant witness testifies that in Venezuela, she was in official position related to elections and witnessed manipulations of petitions to prevent a removal of President Chavez and because she protested, she was summarily dismissed. She explains the vulnerabilities of the electronic voting system and Smartmatica to such manipulations. (*See* Exh. 17, Cardozo Aff. ¶8).

[6] *See* Patents Assigned to Smartmatic Corp., *available at:* https://patents.justia.com/assignee/smartmatic-corp

3. US Government Warnings Regarding Hacking by Hostile Foreign Governments.

82. In October of 2020 The FBI and CISA issued a JOINT CYBERSECURITY ADVISORY ON October 30, 2020 titled: **Iranian Advanced Persistent Threat Actor Identified Obtained Voter Registration Data**

> This joint cybersecurity advisory was coauthored by the Cybersecurity and Infrastructure Security Agency (CISA) and the Federal Bureau of Investigation (FBI). CISA and the FBI are aware of an Iranian advanced persistent threat (APT) actor targeting U.S. state websites to include election websites. CISA and the FBI assess this actor is responsible for the mass dissemination of voter intimidation emails to U.S. citizens and the dissemination of U.S. election-related disinformation in mid-October 2020.1 (Reference FBI FLASH message ME-000138-TT, disseminated October 29, 2020). Further evaluation by CISA and the FBI has identified the targeting of U.S. state election websites was an intentional effort to influence and interfere with the 2020 U.S. presidential election.

(*See* Exh. 18, CISA and FBI Joint Cyber Security Advisory of October 30, 2020)

D. Additional Independent Findings of Dominion Flaws.

83. Further supportive of this pattern of incidents, reflecting an absence of mistake, Plaintiff has since learned that the "glitches" in the Dominion system, that have the uniform effect of hurting Trump and helping Biden, have been widely reported in the press and confirmed by the analysis of independent experts.

1. Central Operator Can Remove, Discard or Manipulate Votes.

84. Mr. Watkins further explains **that the central operator can remove or discard batches of votes.** "After all of the ballots loaded into the scanner's feed tray have been through the scanner, the "ImageCast Central" operator will remove the ballots from the tray then have the option to either "Accept Batch" or "Discard Batch" on the scanning menu …. " (Exh. 106, Watkins aff. ¶11). ¶8.

85. Mr. Watkins further testifies that the user manual makes clear that the system allows for

threshold settings to be set to find all ballots get marked as "problem ballots" for discretionary determinations on where the vote goes stating:

> 9. During the ballot scanning process, the "ImageCast Central" software will detect how much of a percent coverage of the oval was filled in by the voter. The Dominion customer determines the thresholds of which the oval needs to be covered by a mark in order to qualify as a valid vote. If a ballot has a marginal mark which did not meet the specific thresholds set by the customer, then the ballot is considered a "problem ballot" and may be set aside into a folder named "NotCastImages".
>
> 10. Through creatively tweaking the oval coverage threshold settings, and advanced settings on the ImageCase Central scanners, it may be possible to set thresholds in such a way that a non-trivial amount of ballots are marked "problem ballots" and sent to the "NotCastImages" folder.
>
> 11. The administrator of the ImageCast Central work station may view all images of scanned ballots which were deemed "problem ballots" by simply navigating via the standard "Windows File Explorer" to the folder named "NotCastImages" which holds ballot scans of "problem ballots". It may be possible for an administrator of the "ImageCast Central" workstation to view and delete any individual ballot scans from the "NotCastImages" folder by simply using the standard Windows delete and recycle bin functions provided by the Windows 10 Pro operating system. *Id.* ¶¶ 9-11.

2. Dominion – By Design – Violates Federal Election & Voting Record Retention Requirements.

86. The Dominion System put in place by its own design violates the intent of Federal law on the requirement to preserve and retain records – which clearly requires preservation of all records requisite to voting in such an election.

> **§ 20701.** Retention and preservation of records and papers by officers of elections; deposit with custodian; penalty for violation
>
> Every officer of election shall retain and preserve, for a period of twenty-two months from the date of any general, special, or primary election of which candidates for the office of President, Vice President, presidential elector, Member of the Senate, Member of the House of Representatives, or Resident Commissioner from the Commonwealth of Puerto Rico are voted for, **all records and papers which come into his possession relating to any application, registration, payment of poll tax, or other act requisite to voting in such election,** except that, when required by law, such records and papers may be delivered to another officer of election and except that,

> if a State or the Commonwealth of Puerto Rico designates a custodian to retain and preserve these records and papers at a specified place, then such records and papers may be deposited with such custodian, and the duty to retain and preserve any record or paper so deposited shall devolve upon such custodian. Any officer of election or custodian who willfully fails to comply with this section shall be fined not more than $1,000 or imprisoned not more than one year, or both.

See 52 USC § 20701.

3. Dominion Vulnerabilities to Hacking.

87. Plaintiff has since learned that the "glitches" in the Dominion system -- that have the uniform effect of hurting Trump and helping Biden -- have been widely reported in the press and confirmed by the analysis of independent experts, a partial summary of which is included below.

> (1) Users on the ground have full admin privileges to machines and software. The Dominion system is designed to facilitate vulnerability and allow a select few to determine which votes will be counted in any election. Workers were responsible for moving ballot data from polling place to the collector's office and inputting it into the correct folder. Any anomaly, such as pen drips or bleeds, is not counted and is handed over to a poll worker to analyze and decide if it should count. This creates massive opportunity for improper vote adjudication. (Exh. 106 Watkins aff. ¶¶8 & 11).
>
> (2) Affiant witness (name redacted for security reasons), in his sworn testimony explains he was selected for the national security guard detail of the President of Venezuela, and that he witnessed the creation of Smartmatic for the purpose of election vote manipulation:
>
> I was witness to the creation and operation of a sophisticated electronic voting system that permitted the leaders of the Venezuelan government to manipulate the tabulation of votes for national and local elections and select the winner of those elections in order to gain and maintain their power. Importantly, I was a direct witness to the creation and operation of an electronic voting system in a conspiracy between a company known as Smartmatic and the leaders of conspiracy with the Venezuelan government. This conspiracy specifically involved President Hugo Chavez Frias, the person in charge of the National Electoral Council named Jorge Rodriguez, and principals, representatives, and personnel from Smartmatic which included … The purpose of this conspiracy was

to create and operate a voting system that could change the votes in elections from votes against persons running the Venezuelan government to votes in their favor in order to maintain control of the government. (*Id.* ¶¶6, 9, 10).

88. Specific vulnerabilities of the systems in question that have been well documented or reported include:

A. Barcodes can override the voters' vote: As one University of California, Berkeley study shows, "In all three of these machines [including Dominion Voting Systems] the ballot marking printer is in the same paper path as the mechanism to deposit marked ballots into an attached ballot box. This opens up a very serious security vulnerability: the voting machine can make the paper ballot (to add votes or spoil already-case votes) after the last time the voter sees the paper, and then deposit that marked ballot into the ballot box without the possibility of detection." (*See* Exh. 2, Appel Study).

B. Voting machines were able to be connected to the internet by way of laptops that were obviously internet accessible. If one laptop was connected to the internet, the entire precinct was compromised.

C. October 6, 2006 – **Congresswoman Carolyn Maloney calls on Secretary of Treasury Henry Paulson to conduct an investigation into Smartmatic based on its foreign ownership and ties to Venezuela.** (*See* Exh. 15). Congresswoman Maloney wrote that "It is undisputed that Smartmatic is foreign owned and it has acquired Sequoia … Smartmatic now acknowledged that Antonio Mugica, a Venezuelan businessman has a controlling interest in Smartmatica, but the company has not revealed who all other Smartmatic owners are. *Id.*

D. Dominion "got into trouble" with several subsidiaries it used over alleged cases of fraud. One subsidiary is Smartmatic, a company "that has played a significant role in the U.S. market over the last decade."[7] Dominion entered into a 2009 contract with Smartmatic and provided Smartmatic with the PCOS machines (optical scanners) that were used in the 2010 Philippine election, the biggest automated election run by a private company. The automation of that first election in the Philippines was hailed by the international community and by the critics of the automation. The results transmission reached 90% of votes four hours after polls closed and Filipinos knew for the first time who would be

[7] *Voting Technology Companies in the U.S. – Their Histories and Present Contributions,* Access Wire, (Aug. 10, 2017), *available at:* https://www.accesswire.com/471912/Voting-Technology-Companies-in-the-US--Their-Histories.

their new president on Election Day. In keeping with local Election law requirements, Smartmatic and Dominion were required to provide the source code of the voting machines prior to elections so that it could be independently verified. *Id.*

E. Litigation over Smartmatic "glitches" alleges they impacted the 2010 and 2013 mid-term elections in the Philippines, raising questions of cheating and fraud. An independent review of the source codes used in the machines found multiple problems, which concluded, "The software inventory provided by Smartmatic is inadequate, … which brings into question the software credibility."[8]

F. Dominion acquired Sequoia Voting Systems as well as Premier Election Solutions (formerly part of Diebold, which sold Premier to ES&S in 2009, until antitrust issues forced ES&S to sell Premier, which then was acquired by Dominion). This map illustrates 2016 voting machine data—meaning, these data do not reflect geographic aggregation at the time of acquisition, but rather the machines that retain the Sequoia or Premier/Diebold brand that now fall under Dominion's market share. Penn Wharton Study at 16.

G. In late December of 2019, three Democrat Senators, Warren, Klobuchar, Wyden and House Member Mark Pocan wrote about their 'particularized concerns that secretive & "trouble -plagued companies"' "have long skimped on security in favor of convenience," in the context of how they described the voting machine systems that three large vendors – Election Systems & Software, Dominion Voting Systems, & Hart InterCivic – collectively provide voting machines & software that facilitate voting for over 90% of all eligible voters in the U.S." (*See* Exh. 16).

H. Senator Ron Wyden (D-Oregon) said the findings [insecurity of voting systems] are "yet another damning indictment of the profiteering election vendors, who care more about the bottom line than protecting our democracy." It's also an indictment, he said, "of the notion that important cybersecurity decisions should be left entirely to county election offices, many of whom do not employ a single cybersecurity specialist."[9]

---

[8] *Smartmatic-TIM Running Out of Time to Fix Glitche*s, ABS-CBN News (May 4, 2010), *available at*: https://news.abs-cbn.com/nation/05/04/10/smartmatic-tim-running-out-time-fix-glitches.

[9] Kim Zetter, *Exclusive: Critical U.S. Election Systems Have Been Left Exposed Online Despite Official Denials*, VICE (Aug. 8, 2019) ("VICE Election Article"), *available at:*

89. The House of Representatives passed H.R. 2722 in an attempt to address these very risks on June 27, 2019:

> This bill addresses election security through grant programs and requirements for voting systems and paper ballots.
>
> The bill establishes requirements for voting systems, including that systems (1) use individual, durable, voter-verified paper ballots; (2) make a voter's marked ballot available for inspection and verification by the voter before the vote is cast; (3) ensure that individuals with disabilities are given an equivalent opportunity to vote, including with privacy and independence, in a manner that produces a voter-verified paper ballot; (4) be manufactured in the United States; and (5) meet specified cybersecurity requirements, including the prohibition of the connection of a voting system to the internet.
>
> *See* H.R. 2722.

E. Because Dominion Senior Management Has Publicly Expressed Hostility to Trump and Opposition to His Election, Dominion Is Not Entitled to Any Presumption of Fairness, Objectivity or Impartiality, and Should Instead Be Treated as a Hostile Partisan Political Actor.

90. Dr. Eric Coomer is listed as the co-inventor for several patents on ballot adjudication and voting machine-related technology, all of which were assigned to Dominion.[10] He joined Dominion in 2010, and most recently served as Voting Systems

---

https://www.vice.com/en/article/3kxzk9/exclusive-critical-us-election-systems have-been-left-exposed-online-despite-official-denials.

[10] *See* "Patents by Inventor Eric Coomer," *available at:* https://patents.justia.com/inventor/eric-coomer. This page lists the following patents issued to Dr. Coomer and his co-inventors: (1) U.S. Patent No. 9,202,113, Ballot Adjudication in Voting Systems Utilizing Ballot Images (issued Dec. 1, 2015); (2) U.S. Patent No. 8,913,787, Ballot Adjudication in Voting Systems Utilizing Ballot Images (issued Dec. 16, 2014); (3) U.S. Patent No. 8,910,865, Ballot Level Security Features for Optical Scan Voting Machine Capable of Ballot Image Processing, Secure Ballot Printing, and Ballot Layout Authentication and Verification (issued Dec. 16, 2014); (4) U.S. Patent No. 8,876,002, Systems for Configuring Voting Machines, Docking Device for Voting Machines, Warehouse Support and Asset Tracking of Voting Machines (issued Nov. 4, 2014); (5) U.S. Patent No. 8,864,026, Ballot Image Processing System and

Officer of Strategy and Director of Security for Dominion. Dr. Coomer first joined Sequoia Voting Systems in 2005 as Chief Software Architect and became Vice President of Engineering before Dominion Voting Systems acquired Sequoia. Dr. Coomer's patented ballot adjudication technology into Dominion voting machines sold throughout the United States, including those used in Wisconsin. *See* Exh. 6 (Jo Oltmann Affidavit).

91. In 2016, Dr. Coomer admitted to the State of Illinois that Dominion Voting machines can be manipulated remotely.[11] He has also publicly posted videos explaining how Dominion voting machines can be remotely manipulated. *See Id.*[12]

92. Dr. Coomer has emerged as Dominion's principal defender, both in litigation alleging that Dominion rigged elections in Georgia and in the media. An examination of his previous public statements has revealed that Dr. Coomer is highly partisan and even more anti-Trump, precisely the opposite of what would expect from the management of a company charged with fairly and impartially counting votes (which is presumably why he tried to scrub his social media history). (*See Id.*)

93. Unfortunately for Dr. Coomer, however, a number of these posts have been captured for perpetuity. Below are quotes from some of his greatest President Trump and Trump voter hating hits to show proof of motive and opportunity. (*See* Id).

Method for Voting Machines (issued Oct. 21, 2014); (6) U.S. Patent No. 8,714,450, Systems and Methods for Transactional Ballot Processing, and Ballot Auditing (issued May 6, 2014), available at: https://patents.justia.com/inventor/eric-coomer.

[11] Jose Hermosa, *Electoral Fraud: Dominion's Vice President Warned in 2016 That Vote-Counting Systems Are Manipulable*, The BL (Nov. 13, 2020), *available at*: https://thebl.com/us-news/electoral-fraud-dominions-vice-president-warned-in-2016-that-vote-counting-systems-are-manipulable.html.

[12] See, *e.g.,* "Eric Coomer Explains How to Alter Votes in the Dominion Voting System" (Nov. 24, 2020) (excerpt of presentation delivered in Chicago in 2017), *available at:* https://www.youtube.com/watch?v=UtB3tLaXLJE.

> If you are planning to vote for that autocratic, narcissistic, fascist ass-hat blowhard and his Christian jihadist VP pic, UNFRIEND ME NOW! No, I'm not joking. … Only an absolute F[**]KING IDIOT could ever vote for that wind-bag fuck-tard FASCIST RACIST F[**]K! … I don't give a damn if you're friend, family, or random acquaintance, pull the lever, mark an oval, touch a screen for that carnival barker … UNFRIEND ME NOW! I have no desire whatsoever to ever interact with you. You are beyond hope, beyond reason. You are controlled by fear, reaction and bullsh[*]t. Get your shit together. F[**]K YOU! Seriously, this f[**]king ass-clown stands against everything that makes this country awesome! You want in on that? You [Trump voters] deserve nothing but contempt. *Id.* (July 21, 2016 Facebook post).[13]

94. In a rare moment of perhaps unintentional honesty, Dr. Coomer anticipates this Amended Complaint and many others, by slandering those seeking to hold election riggers like Dominion to account and to prevent the United States' descent into Venezuelan levels of voting fraud and corruption out of which Dominion was born:

> Excerpts in stunning Trump-supporter logic, "I know there is a lot of voter fraud. I don't know who is doing it, or how much is happening, but I know it is going on a lot." This beautiful statement was followed by, "It happens in third world countries, this the US, we can't let it happen here." *Id.* (October 29, 2016 Facebook post); (*See* also Exh. 6)

95. Dr. Coomer, who invented the technology for Dominion's voting fraud and has publicly explained how it can be used to alter votes, seems to be extremely hostile to those who would attempt to stop it and uphold the integrity of elections that underpins the legitimacy of the United States government:

> And in other news… There be some serious fuckery going on right here fueled by our Cheeto-in-Chief stoking lie after lie on the flames of [Kris] Kobach… [Linking Washington Post article discussing the Presidential Advisory Commission on Election Integrity, of which former Kansas Secretary of State Kris Kobach was a member, entitled, "The voting commission is a fraud itself. Shut it down."] *Id.* (September 14, 2017 Facebook post.] (*Id.*)

[13] In this and other quotations from Dr. Coomer's social media, Plaintiff has redacted certain profane terms.

96. Dr. Coomer also keeps good company, supporting and reposting ANTIFA statements slandering President Trump as a "fascist" and by extension his supporters, voters and the United States military (which he claims, without evidence, Trump will make into a "fascist tool"). *Id.* (June 2, 2020 Facebook post). Lest someone claims that these are "isolated statements" "taken out of context", Dr. Coomer has affirmed that he shares ANTIFA's taste in music and hatred of the United States of America, *id.* (May 31, 2020 Facebook post linking "F[**]k the USA" by the exploited), and the police. *Id.* (separate May 31, 2020 Facebook posts linking N.W.A. "F[**]k the Police" and a post promoting phrase "Dead Cops"). *Id.* at 4-5.

97. Affiant and journalist Joseph Oltmann researched ANTIFA in Colorado. *Id.* at 1. "On or about the week of September 27, 2020," he attended an Antifa meeting which appeared to be between Antifa members in Colorado Springs and Denver Colorado," where Dr. Coomer was present. In response to a question as to what Antifa would do "if Trump wins this … election?", Dr. Coomer responded "Don't worry about the election. Trump is not going to win. I made f[**]king sure of that … Hahaha." *Id.* at 2.

98. By putting an anti-Trump zealot like Dr. Coomer in charge of election "Security," and using his technology for what should be impartial "ballot adjudication," Dominion has given the fox the keys to the hen house ***and has forfeited any presumption of objectivity, fairness, or even propriety***. It appears that Dominion does not care about even an appearance of impropriety, as its most important officer has his fingerprints all over a highly partisan, vindictive, and personal vendetta against the Republican nominee both in 2016 and 2020, President Donald Trump. Dr. Coomer's highly partisan anti-Trump rages show clear motive on the part of Dominion to rig the election in favor of Biden, and may well explain why for each of the so-called "glitches"

uncovered, it is always Biden receiving the most votes on the favorable end of such a "glitch." (*Id.*)

99. In sum, as set forth above, for a host of independent reasons, the Wisconsin election results concluding that Joe Biden received 20,608 more votes that President Donald Trump must be set aside.

COUNT I

Defendants Violated the Elections and Electors Clauses and 42 U.S.C. § 1983.

100. Plaintiff realleges all preceding paragraphs as if fully set forth herein.

101. The Electors Clause states that "[e]ach State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors" for President. U.S. Const. art. II, §1, cl. 2 (emphasis added). Likewise, the Elections Clause of the U.S. Constitution states that "[t]he Times, Places, and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by *the Legislature* thereof." U.S. Const. art. I, § 4, cl. 1 (emphasis added).

102. The Legislature is "'the representative body which ma[kes] the laws of the people.'" *Smiley v. Holm,* 285 U.S. 355, 365 (1932). Regulations for presidential elections, thus, "must be in accordance with the method which the state has prescribed for legislative enactments." *Id.* at 367; *see also Ariz. State Legislature v. Ariz. Indep. Redistricting Comm'n*, 135 S. Ct. 2652, 2668 (2015).

103. Defendants are not part of the Wisconsin Legislature and cannot exercise legislative power. Because the United States Constitution reserves for the Wisconsin Legislature the power to set the time, place, and manner of holding elections for the President and Congress, county boards of elections and state executive officers have no authority to unilaterally exercise that power, much less to hold them in ways that conflict

with existing legislation.

104. Section I details three separate instances where Defendants violated the Wisconsin Election Code. First, WEC May 23, 2020 "guidance" on the treatment of "indefinitely confined" voters, who are exempt from Wisconsin's photo ID requirement for absentee ballot application, that directly contravened the express requirement in Wisconsin Election Code that clerks "shall" remove an allegedly "indefinitely confined" voter if the clerk has "reliable information" that that voter is not, or is no longer, "indefinitely confined."

105. Second, the WEC's October 18, 2016 guidance directed clerks to violate the express requirements of Wisconsin Statutes § 6.87(6)(d), which states "[i]f a certificate is missing the address of a witness the ballot may not be counted," when it directed clerks to fill in missing information on absentee ballot envelopes.

106. Third, WEC and Wisconsin election officials violated Wisconsin Election Code, or acted *ultra vires*, insofar as they filled in missing witness or voter information on absentee ballots and permitted voters to cure ballots without statutory authorization. Section II provides expert witness testimony quantifying the number of illegal or ineligible ballots that were counted, and lawful ballots that were not, as a result of these and Defendants' other violations.

107. A report from Dr. William Briggs, shows that there were approximately 29,594 absentee ballots listed as "unreturned" by voters that either never requested them, or that requested and returned their ballots.

108. Evidence compiled by Matt Braynard, Exh. 3, using the National Change of Address ("NCOA") Database shows that 6,207 Wisconsin voters in the 2020 General Election moved out-

of-state prior to voting, and therefore were ineligible. Mr. Braynard also identified 765 Wisconsin voters who subsequently registered to vote in another state and were therefore ineligible to vote in the 2020 General Election. The merged number is 6,966 ineligible voters whose votes must be removed from the total for the 2020 General Election.

109. Plaintiff has no adequate remedy at law and will suffer serious and irreparable harm unless the injunctive relief requested herein is granted. Defendants have acted and, unless enjoined, will act under color of state law to violate the Elections Clause.

110. Accordingly, the results for President in the November 3, 2020 election must be set aside, the State of Wisconsin should be enjoined from transmitting the certified the results thereof, and this Court should grant the other declaratory and injunctive relief requested herein.

COUNT II

Governor Evers and Other Defendants Violated The Equal Protection Clause of the Fourteenth Amendment U.S. Const. Amend. XIV & 42 U.S.C. § 1983

Invalid Enactment of Regulations & Disparate Treatment of Absentee vs. Mail-In Ballots

111. Plaintiff refers to and incorporate by reference each of the prior paragraphs of this Amended Complaint as though the same were repeated at length herein.

112. The Fourteenth Amendment of the United States Constitution provides "nor shall any state deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws. *See also Bush v. Gore*, 531 U.S. 98, 104 (2000) (having once granted the right to vote on equal terms, the State may not, by later arbitrary and disparate treatment, value one person's vote over the value of another's). *Harper v. Va. Bd. of Elections*, 383 U.S. 663, 665 (1966) ("Once the

franchise is granted to the electorate, lines may not be drawn which are inconsistent with the Equal Protection Clause of the Fourteenth Amendment."). The Court has held that to ensure equal protection, a problem inheres in the absence of specific standards to ensure its equal application. *Bush*, 531 U.S. at 106 ("The formulation of uniform rules to determine intent based on these recurring circumstances is practicable and, we conclude, necessary.").

113. The equal enforcement of election laws is necessary to preserve our most basic and fundamental rights. The requirement of equal protection is particularly stringently enforced as to laws that affect the exercise of fundamental rights, including the right to vote.

114. The disparate treatment of Wisconsin voters, in subjecting one class of voters to greater burdens or scrutiny than another, violates Equal Protection guarantees because "the right of suffrage can be denied by a debasement or dilution of the weight of a citizen's vote just as effectively as by wholly prohibiting the free exercise of the franchise." *Reynolds v. Sims*, 377 U.S. 533, 555 (1964); *Rice v. McAlister*, 268 Ore. 125, 128, 519 P.2d 1263, 1265 (1975); *Heitman v. Brown Grp., Inc.,* 638 S.W.2d 316, 319, 1982 Mo. App. LEXIS 3159, at *4 (Mo. Ct. App. 1982); *Prince v. Bear River Mut. Ins. Co.*, 2002 UT 68, ¶ 41, 56 P.3d 524, 536-37 (Utah 2002).

115. In statewide and federal elections conducted in the State of Wisconsin, including without limitation the November 3, 2020 General Election, all candidates, political parties, and voters, including without limitation Plaintiff, in having the election laws enforced fairly and uniformly.

116. As set forth in Section I above, Defendants failed to comply with the requirements

of the Wisconsin Election Code and thereby diluted the lawful ballots of the Plaintiff and of other Wisconsin voters and electors in violation of the United States Constitution guarantee of Equal Protection. Further, Defendants enacted regulations, or issued guidance, that had the intent and effect of favoring one class of voters – Democratic absentee voters – over Republican voters. Further, all of these invalidly enacted rules by Defendant Wisconsin executive and administrative agencies, had the intent and effect of eliminating protections against voter fraud, and thereby enabled and facilitated the counting of fraudulent, unlawful and ineligible votes, which were quantified in Section II. Finally, Section III details the additional voting fraud and manipulation enabled by the use Dominion voting machines, which had the intent and effect of favoring Biden and Democratic voters and discriminating against Trump and Republican voters.

117. Defendants have acted and will continue to act under color of state law to violate Plaintiff's right to be present and have actual observation and access to the electoral process as secured by the Equal Protection Clause of the United States Constitution. Defendants thus failed to conduct the general election in a uniform manner as required by the Equal Protection Clause of the Fourteenth Amendment, the corollary provisions of the Wisconsin Constitution, and the Wisconsin Election Code.

118. Plaintiff seeks declaratory and injunctive relief forbidding Defendants from certifying a tally that includes any ballots that were not legally cast, or that were switched from Trump to Biden through the unlawful use of Dominion Democracy Suite software and devices.

119. The Briggs analysis identified two specific errors involving unreturned mail-in ballots that are indicative of voter fraud, namely: "**Error #1:** those who were recorded as receiving

absentee ballots ***without*** requesting them;" and "**Error #2:** those who returned absentee ballots but whose votes went missing (*i.e.*, marked as unreturned)." Clearly the dilution of lawful votes violates the Equal Protection clause; and the counting of unlawful votes violates the rights of lawful Citizens.

120. In addition, Plaintiff asks this Court to order that no ballot processed by a counting board in the Wisconsin Counties can be included in the final vote tally unless a challenger was allowed to meaningfully observe the process and handling and counting of the ballot, or that were unlawfully switched from Trump to Biden.

121. Plaintiff has no adequate remedy at law and will suffer serious and irreparable harm unless the declaratory and injunctive relief requested herein is granted. Indeed, the setting aside of an election in which the people have chosen their representative is a drastic remedy that should not be undertaken lightly, but instead should be reserved for cases in which a person challenging an election has clearly established a violation of election procedures and has demonstrated that the violation has placed the result of the election in doubt. Wisconsin law allows elections to be contested through litigation, both as a check on the integrity of the election process and as a means of ensuring the fundamental right of citizens to vote and to have their votes counted accurately.

COUNT III

Fourteenth Amendment, Amend. XIV & 42 U.S.C. § 1983

Denial of Due Process On The Right to Vote

122. Plaintiff refers to and incorporate by reference each of the prior paragraphs of this Amended Complaint as though the same were repeated at length herein.

123. The right of qualified citizens to vote in a state election involving federal

candidates is recognized as a fundamental right under the Fourteenth Amendment of the United States Constitution. *Harper,* 383 U.S. at 665. *See also Reynolds*, 377 U.S. at 554 (The Fourteenth Amendment protects the "the right of all qualified citizens to vote, in state as well as in federal elections."). Indeed, ever since the Slaughter-House Cases, 83 U.S. 36 (1873), the United States Supreme Court has held that the Privileges and Immunities Clause of the Fourteenth Amendment protects certain rights of federal citizenship from state interference, including the right of citizens to vote in federal elections. *See Twining v. New Jersey*, 211 U.S. 78, 97 (1908) (*citing Ex parte Yarbrough*, 110 U.S. 651, 663-64 (1884)). *See also Oregon v. Mitchell*, 400 U.S. 112, 148-49 (1970) (Douglas, J., concurring) (collecting cases).

124. The fundamental right to vote protected by the Fourteenth Amendment is cherished in our nation because it "is preservative of other basic civil and political rights." *Reynolds*, 377 U.S. at 562. Voters have a "right to cast a ballot in an election free from the taint of intimidation and fraud," *Burson v. Freeman*, 504 U.S. 191, 211 (1992), and "[c]onfidence in the integrity of our electoral processes is essential to the functioning of our participatory democracy." *Purcell v. Gonzalez*, 549 U.S. 1, 4 (2006) (per curiam).

125. "Obviously included within the right to [vote], secured by the Constitution, is the right of qualified voters within a state to cast their ballots and have them counted" if they are validly cast. *United States v. Classic*, 313 U.S. 299, 315 (1941). "[T]he right to have the vote counted" means counted "at full value without dilution or discount." *Reynolds*, 377 U.S. at 555, n.29 (*quoting South v. Peters*, 339 U.S. 276, 279 (1950) (Douglas, J., dissenting)).

"Every voter in a federal . . . election, whether he votes for a candidate with little chance of winning or for one with little chance of losing, has a right under the Constitution to have his vote fairly counted, without its being distorted by fraudulently cast votes." *Anderson v. United States*, 417 U.S. 211, 227 (1974); *see also Baker v. Carr*, 369 U.S. 186, 208 (1962). Invalid or fraudulent votes debase and dilute the weight of each validly cast vote. *Reynolds*, 377 U.S. at 555.

126. The right to vote includes not just the right to cast a ballot, but also the right to have it fairly counted if it is legally cast. The right to vote is infringed if a vote is cancelled or diluted by a fraudulent or illegal vote, including without limitation when a single person votes multiple times. The Supreme Court of the United States has made this clear in case after case. *See, e.g., Gray v. Sanders*, 372 U.S. 368, 380 (1963) (every vote must be "protected from the diluting effect of illegal ballots."); *Crawford v. Marion Cnty. Election Bd.*, 553 U.S. 181, 196 (2008) (plurality op. of Stevens, J.) ("There is no question about the legitimacy or importance of the State's interest in counting only the votes of eligible voters."); *accord Reynolds v. Sims*, 377 U.S. 533, 554-55 & n.29 (1964).

127. The right to an honest count is a right possessed by each voting elector, and to the extent that the importance of his vote is nullified, wholly or in part, he has been injured in the free exercise of a right or privilege secured to him by the laws and Constitution of the United States. *Anderson*, 417 U.S. at 226 (*quoting Prichard v. United States*, 181 F.2d 326, 331 (6th Cir.), *aff'd due to absence of quorum*, 339 U.S. 974 (1950)).

128. Practices that promote the casting of illegal or unreliable ballots or fail to contain basic minimum guarantees against such conduct, can violate the Fourteenth Amendment by leading to the dilution of validly cast ballots. *See Reynolds*, 377 U.S. at 555 ("the right

of suffrage can be denied by a debasement or dilution of the weight of a citizen's vote just as effectively as by wholly prohibiting the free exercise of the franchise.").

129. Section I details the Defendants violations of the Wisconsin Election Code. Section II provides estimates of the number of fraudulent, illegal or ineligible votes counted, and demonstrates that this number is many times larger than Biden's margin of victory.

130. Plaintiff seeks declaratory and injunctive relief enjoining Defendants from certifying the results of the General Election, or in the alternative, conduct a recount or recanvas in which they allow a reasonable number of challengers to meaningfully observe the conduct of the Wisconsin Board of State Canvassers and the Wisconsin county Boards of Canvassers and that these canvassing boards exercise their duty and authority under Wisconsin law, which forbids certifying a tally that includes any ballots that were not legally cast, or that were switched from Trump to Biden through the unlawful use of Dominion Democracy Suite software and devices.

COUNT IV

Wide-Spread Ballot Fraud

131. Plaintiff realleges all preceding paragraphs as if fully set forth herein.

132. The scheme of civil fraud can be shown with the pattern of conduct that includes motive and opportunity, as exhibited by the high level official at Dominion Voting Systems, Eric Coomer, and his visceral and public rage against the current U.S. President.

133. Opportunity appears with the secretive nature of the voting source code, and the feed of votes that make clear that an algorithm is applied, that reports in decimal points despite the law requiring one vote for one ballot.

134. The results of the analysis and the pattern seen in the included graph strongly suggest a systemic, system-wide algorithm was enacted by an outside agent, causing the results of Wisconsin's vote tallies to be inflated by somewhere between 3 and 5.6 percentage points. Statistical estimating yields that in Wisconsin, the best estimate of the number of impacted votes is 181,440. *Id.*

135. The Reports cited above show a total amount of illegal votes identified that amount to 318,012 or over 15 times the margin by which candidate Biden leads President Trump in the state of Wisconsin.

136. The right to vote includes not just the right to cast a ballot, but also the right to have it fairly counted if it is legally cast. The right to vote is infringed if a vote is cancelled or diluted by a fraudulent or illegal vote, including without limitation when a single person votes multiple times. The Supreme Court of the United States has made this clear in case after case. *See*, e.g., *Gray v. Sanders*, 372 U.S. 368, 380 (1963) (every vote must be "protected from the diluting effect of illegal ballots."); *Crawford v. Marion Cnty. Election Bd.*, 553 U.S. 181, 196 (2008) (plurality op. of Stevens, J.) ("There is no question about the legitimacy or importance of the State's interest in counting only the votes of eligible voters."); *accord Reynolds v. Sims*, 377 U.S. 533, 554-55 & n.29 (1964).

137. Plaintiff has no adequate remedy at law. Plaintiff contests the results of Wisconsin's 2020 General Election because it is fundamentally corrupted by fraud. Defendants intentionally violated multiple provisions of the Wisconsin Election Code to elect Biden and other Democratic candidates and defeat President Trump and other Republican candidates.

PRAYER FOR RELIEF

138. Accordingly, Plaintiff seeks temporary restraining order instructing Defendants to de-certify the results of the General Election for the Office of President.

139. Alternatively, Plaintiff seeks an order instructing the Defendants to certify the results of the General Election for Office of the President in favor of President Donald Trump.

140. In the alternative, Plaintiff seeks a temporary restraining order prohibiting Defendants from including in any certified results from the General Election the tabulation of absentee and mailing ballots which do not comply with the Wisconsin Election Code, including, without limitation, the tabulation of absentee and mail-in ballots Trump Campaign's watchers were prevented from observing or based on the tabulation of invalidly cast absentee and mail-in ballots which (i) lack a secrecy envelope, or contain on that envelope any text, mark, or symbol which reveals the elector's identity, political affiliation, or candidate preference, (ii) do not include on the outside envelope a completed declaration that is dated and signed by the elector, (iii) are delivered in-person by third parties for non-disabled voters, or (iv) any of the other Wisconsin Election Code violations set forth in Section II of this Amended Complaint.

141. Order production of all registration data, ballot applications, ballots, envelopes, etc. required to be maintained by law. When we consider the harm of these uncounted votes, and ballots not ordered by the voters themselves, and the potential that many of these unordered ballots may in fact have been improperly voted and also prevented proper voting at the polls, the mail ballot system has clearly failed in the state of Wisconsin and did so on a large scale and widespread basis. The size of the voting failures, whether accidental or intentional, are multiples larger than the margin in the state. For these reasons, Wisconsin cannot reasonably rely on the results of the

mail vote. Relief sought is the elimination of the mail ballots from counting in the 2020 election. Alternatively, the electors for the State of Wisconsin should be disqualified from counting toward the 2020 election. Alternatively, the electors of the State of Wisconsin should be directed to vote for President Donald Trump.

142. For these reasons, Plaintiff asks this Court to enter a judgment in his favor and provide the following emergency relief:

1. An order directing Governor Evers and the Wisconsin Elections Commission to de-certify the election results;

2. An order enjoining Governor Evers from transmitting the currently certified election results the Electoral College;

3. An order requiring Governor Evers to transmit certified election results that state that President Donald Trump is the winner of the election;

4. An immediate temporary restraining order to seize and impound all servers, software, voting machines, tabulators, printers, portable media, logs, ballot applications, ballot return envelopes, ballot images, paper ballots, and all "election materials" referenced in Wisconsin Statutes § 9.01(1)(b)11. related to the November 3, 2020 Wisconsin election for forensic audit and inspection by the Plaintiff;

5. An order that no votes received or tabulated by machines that were not certified as required by federal and state law be counted;

6. A declaratory judgment declaring that Wisconsin's failed system of signature verification violates the Electors and Elections Clause by working a de facto abolition of the signature verification requirement;

7. A declaratory judgment declaring that currently certified election results violate the Due Process Clause, U.S. CONST. Amend. XIV;

8. A declaratory judgment declaring that mail-in and absentee ballot fraud must be remedied with a Full Manual Recount or statistically valid sampling that properly verifies the signatures on absentee ballot envelopes and that invalidates the certified results if the recount or sampling analysis shows a sufficient number of ineligible absentee ballots were counted;

9. A declaratory judgment declaring absentee ballot fraud occurred in violation of Constitutional rights, Election laws and under state law;

10. A permanent injunction prohibiting the Governor and Secretary of State from transmitting the currently certified results to the Electoral College based on the overwhelming evidence of election tampering;

11. Immediate production of 48 hours of security camera recordings of all voting central count facilities and processes in Milwaukee and Dane Counties for November 3, 2020 and November 4, 2020.

12. Plaintiff further requests the Court grant such other relief as is just and proper, including but not limited to, the costs of this action and his reasonable attorney fees and expenses pursuant to 42 U.S.C. 1988.

Respectfully submitted, this 3rd day of December, 2020.

DECLARATION OF [redacted]

I, [redacted], hereby state the following:

1. [redacted]

2. I am an adult of sound mine. All statements in this declaration are based on my personal knowledge and are true and correct.

3. I am making this statement voluntarily and on my own initiative. I have not been promised, nor do I expect to receive, anything in exchange for my testimony and giving this statement. I have no expectation of any profit or reward and understand that there are those who may seek to harm me for what I say in this statement. I have not participated in any political process in the United States, have not supported any candidate for office in the United States, am not legally permitted to vote in the United States, and have never attempted to vote in the United States.

4. I want to alert the public and let the world know the truth about the corruption, manipulation, and lies being committed by a conspiracy of people and companies intent upon betraying the honest people of the United States and their legally constituted institutions and fundamental rights as citizens. This conspiracy began more than a decade ago in Venezuela and has spread to countries all over the world. It is a conspiracy to wrongfully gain and keep power and wealth. It involves political leaders, powerful companies, and other persons whose purpose is to gain and keep power by changing the free will of the people and subverting the proper course of governing.

5. [redacted] Over the course of my career, I specialized in the marines [redacted]

6. Due to my training in special operations and my extensive military and academic formations, I was selected for the national security guard detail of the President of Venezuela. [redacted]

[redacted]

7. [redacted] Señor Cabello was a long-time confederate of President Chavez and instrumental in his gaining power. In 2002, Señor Cabello had very briefly taken over the duties of the presidency while Hugo Chavez was imprisoned. Within hours of Señor Cabello taking over the presidency, Hugo Chavez was released from prison and regained the office of President. On December 11, 2011, Cabello was installed as the Vice-President of the United Socialist Party – the party of President Chávez and became the second most powerful figure in the party after Hugo Chávez. Cabello was appointed president of the National Assembly in early 2012 and was re-elected to that post in January 2013. After Hugo Chávez's death, Cabello was next in line for the presidency of the country, but he remained president of the National Assembly and yielded to Nicolás Maduro holding the position of President of Venezuela.

8. [redacted] President Chavez was very precise and exacting in his instructions in the details about meetings he wanted, where the meeting was to occur, who was to attend, what was to be done. [redacted]

9. [redacted] I was witness to the creation and operation of a

sophisticated electronic voting system that permitted the leaders of the Venezuelan government to manipulate the tabulation of votes for national and local elections and select the winner of those elections in order to gain and maintain their power.

10. Importantly, I was a direct witness to the creation and operation of an electronic voting system in a conspiracy between a company known as Smartmatic and the leaders of conspiracy with the Venezuelan government. This conspiracy specifically involved President Hugo Chavez Frias, the person in charge of the National Electoral Council named Jorge Rodriguez, and principals, representatives, and personnel from Smartmatic which included [redacted]. The purpose of this conspiracy was to create and operate a voting system that could change the votes in elections from votes *against* persons running the Venezuelan government to votes *in their favor* in order to maintain control of the government.

11. In mid-February of 2009, there was a national referendum to change the Constitution of Venezuela to end term limits for elected officials, including the President of Venezuela. The referendum passed. This permitted Hugo Chavez to be re-elected an unlimited number of times.

12. After passage of the referendum, President Chavez instructed me to make arrangements for him to meet with Jorge Rodriguez, then President of the National Electoral Council, and three executives from Smartmatic. Among the three Smartmatic representatives were [redacted] President Chavez had multiple meetings with Rodriguez and the Smartmatic team at which I was present. In the first of four meetings, Jorge Rodriguez promoted the idea to create software that would manipulate elections. Chavez was very excited and made it clear that he would provide whatever Smartmatic needed. He wanted them immediately to create a voting system which would ensure that any time anything was going to be voted on the voting system would guarantee results that Chavez wanted. Chavez offered Smartmatic many inducements, including large sums of money, for Smartmatic to create or modify the voting system so that it would guarantee Chavez would win every election cycle. Smartmatic's team agreed to create such a system and did so.

13. I arranged and attended three more meetings between President Chavez and the representatives from Smartmatic at which details of the new

voting system were discussed and agreed upon. For each of these meetings, I communicated directly with [redacted] on details of where and when to meet, where the participants would be picked up and delivered to the meetings, and what was to be accomplished. At these meetings, the participants called their project the "Chavez revolution." From that point on, Chavez never lost any election. In fact, he was able to ensure wins for himself, his party, Congress persons and mayors from townships.

14. Smartmatic's electoral technology was called "Sistema de Gestión Electoral" (the "Electoral Management System"). Smartmatic was a pioneer in this area of computing systems. Their system provided for transmission of voting data over the internet to a computerized central tabulating center. The voting machines themselves had a digital display, fingerprint recognition feature to identify the voter, and printed out the voter's ballot. The voter's thumbprint was linked to a computerized record of that voter's identity. Smartmatic created and operated the entire system.

15. Chavez was most insistent that Smartmatic design the system in a way that the system could change the vote of each voter without being detected. He wanted the software itself to function in such a manner that if the voter were to place their thumb print or fingerprint on a scanner, then the thumbprint would be tied to a record of the voter's name and identity as having voted, but that voter would not tracked to the changed vote. He made it clear that the system would have to be setup to not leave any evidence of the changed vote for a specific voter and that there would be no evidence to show and nothing to contradict that the name or the fingerprint or thumb print was going with a changed vote. Smartmatic agreed to create such a system and produced the software and hardware that accomplished that result for President Chavez.

16. After the Smartmatic Electoral Management System was put in place, I closely observed several elections where the results were manipulated using Smartmatic software. One such election was in December 2006 when Chavez was running against Rosales. Chavez won with a landslide over Manuel Rosales - a margin of nearly 6 million votes for Chavez versus 3.7 million for Rosales.

17. On April 14, 2013, I witnessed another Venezuelan national election in which the Smartmatic Electoral Management System was used to manipulate and change the results for the person to succeed Hugo Chávez

as President. In that election, Nicolás Maduro ran against Capriles Radonsky. [redacted] Inside that location was a control room in which there were multiple digital display screens – TV screens – for results of voting in each state in Venezuela. The actual voting results were fed into that room and onto the displays over an internet feed, which was connected to a sophisticated computer system created by Smartmatic. People in that room were able to see in "real time" whether the vote that came through the electronic voting system was in their favor or against them. If one looked at any particular screen, they could determine that the vote from any specific area or as a national total was going against either candidate. Persons controlling the vote tabulation computer had the ability to change the reporting of votes by moving votes from one candidate to another by using the Smartmatic software.

18. By two o'clock in the afternoon on that election day Capriles Radonsky was ahead of Nicolás Maduro by two million votes. When Maduro and his supporters realized the size of Radonsky's lead they were worried that they were in a crisis mode and would lose the election. The Smartmatic machines used for voting in each state were connected to the internet and reported their information over the internet to the Caracas control center in real-time. So, the decision was made to reset the entire system. Maduro's and his supporters ordered the network controllers to take the internet itself offline in practically all parts in Venezuela and to change the results.

19. It took the voting system operators approximately two hours to make the adjustments in the vote from Radonsky to Maduro. Then, when they turned the internet back on and the on-line reporting was up and running again, they checked each screen state by state to be certain where they could see that each vote was changed in favor of Nicholas Maduro. At that moment the Smartmatic system changed votes that were for Capriles Radonsky to Maduro. By the time the system operators finish, they had achieved a convincing, but narrow victory of 200,000 votes for Maduro.

20. After Smartmatic created the voting system President Chavez wanted, he exported the software and system all over Latin America. It was sent to Bolivia, Nicaragua, Argentina, Ecuador, and Chile – countries that were in alliance with President Chavez. This was a group of leaders who wanted to be able to guarantee they maintained power in their countries. When Chavez died, Smartmatic was in a position of being the only

company that could guarantee results in Venezuelan elections for the party in power.

21. I want to point out that the software and fundamental design of the electronic electoral system and software of Dominion and other election tabulating companies relies upon software that is a descendant of the Smartmatic Electoral Management System. In short, the Smartmatic software is in the DNA of every vote tabulating company's software and system.

22. Dominion is one of three major companies that tabulates votes in the United States. Dominion uses the same methods and fundamentally same software design for the storage, transfer and computation of voter identification data and voting data. Dominion and Smartmatic did business together. The software, hardware and system have the same fundamental flaws which allow multiple opportunities to corrupt the data and mask the process in a way that the average person cannot detect any fraud or manipulation. The fact that the voting machine displays a voting result that the voter intends and then prints out a paper ballot which reflects that change does not matter. It is the software that counts the digitized vote and reports the results. The software itself is the one that changes the information electronically to the result that the operator of the software and vote counting system intends to produce that counts. That's how it is done. So the software, the software itself configures the vote and voting result -- changing the selection made by the voter. The software decides the result regardless of what the voter votes.

23. All of the computer controlled voting tabulation is done in a closed environment so that the voter and any observer cannot detect what is taking place unless there is a malfunction or other event which causes the observer to question the process. I saw first-hand that the manipulation and changing of votes can be done in real-time at the secret counting center which existed in Caracas, Venezuela. For me it was something very surprising and disturbing. I was in awe because I had never been present to actually see it occur and I saw it happen. So, I learned first-hand that it doesn't matter what the voter decides or what the paper ballot says. It's the software operator and the software that decides what counts – not the voter.

24. If one questions the reliability of my observations, they only have to read the words of [redacted] a time period in

which Smartmatic had possession of all the votes and the voting, the votes themselves and the voting information at their disposition in Venezuela. [redacted] he was assuring that the voting system implemented or used by Smartmatic was completely secure, that it could not be compromised, was not able to be altered.

25. But later, in 2017 when there were elections where Maduro was running and elections for legislators in Venezuela, [redacted] and Smartmatic broke their secrecy pact with the government of Venezuela. He made a public announcement through the media in which he stated that all the Smartmatic voting machines used during those elections were totally manipulated and they were manipulated by the electoral council of Venezuela back then. [redacted] stated that all of the votes for Nicholas Maduro and the other persons running for the legislature were manipulated and they actually had lost. So I think that's the greatest proof that the fraud can be carried out and will be denied by the software company that [redacted] admitted publicly that Smartmatic had created, used and still uses vote counting software that can be manipulated or altered.

26. I am alarmed because of what is occurring in plain sight during this 2020 election for President of the United States. The circumstances and events are eerily reminiscent of what happened with Smartmatic software electronically changing votes in the 2013 presidential election in Venezuela. What happened in the United States was that the vote counting was abruptly stopped in five states using Dominion software. At the time that vote counting was stopped, Donald Trump was significantly ahead in the votes. Then during the wee hours of the morning, when there was no voting occurring and the vote count reporting was off-line, something significantly changed. When the vote reporting resumed the very next morning there was a very pronounced change in voting in favor of the opposing candidate, Joe Biden.

27. [redacted] I have worked in gathering information, researching, and working with information technology. That's what I know how to do and the special knowledge that I have. Due to these recent election events, I contacted a number of reliable and intelligent ex-co-workers of mine that are still informants and work with the intelligence community. I asked for them to give me information that was up-to-date information in as far as how all these businesses are acting, what actions they are taking.

I declare under penalty of perjury that the foregoing is true and correct and that this Declaration was prepared in Dallas County, State of Texas, and executed on November 15, 2020.

[redacted]

An Analysis of Surveys Regarding Absentee Ballots Across Several States

William M. Briggs

November 23, 2020

1 Summary

Survey data was collected from individuals in several states, sampling those who the states listed as not returning absentee ballots. The data was provided by Matt Braynard.

The survey asked respondents whether they (a) had ever requested an absentee ballot, and, if so, (b) whether they had in fact returned this ballot. From this sample I produce predictions of the total numbers of: **Error #1**, those who were recorded as receiving absentee ballots *without* requesting them; and **Error #2**, those who returned absentee ballots but whose votes went missing (i.e. marked as unreturned).

The sizes of both errors were large in each state. The states were Georgia, Michigan, Wisconsin, and Arizona where ballots were across parties. Pennsylvania data was for Republicans only.

2 Analysis Description

Each analysis was carried out separately for each state. The analysis used (a) the number of absentee ballots recorded as unreturned, (b) the total responding to the survey, (c) the total of those saying they did not request a ballot, (d) the total of those saying they did request a ballot, and of these (e) the number saying they returned their ballots. I assume survery respondents are representative and the data is accurate.

From these data a simple parameter-free predictive model was used to calculate the probability of all possible outcomes. Pictures of these probabilities were derived, and the 95% prediction interval of the relevant numbers was calculated. The pictures appear in the Appendix at the end. They are summarized here with their 95% prediction intervals.

Error #1: being recorded as sent an absentee ballot without requesting one.

Error #2: sending back an absentee ballot and having it recorded as not returned.

State	Unreturned ballots	Error #1	Error #2
Georgia	138,029	16,938–22,771	31,559–38,866
Michigan	139,190	29,611–36,529	27,928–34,710
Pennsylvania*	165,412	32,414–37,444	26,954–31,643
Wisconsin	96,771	16,316–19,273	13,991–16,757
Arizona	518,560	208,333–229,937	78,714–94,975

*Number for Pennsylvania represent Republican ballots only.

Ballots that were not requested, and ballots returned and marked as not returned were classed as *troublesome*. The estimated average number of troublesome ballots for each state were then calculated using the table above and are presented next.

State	Unreturned ballots	Estimated average troublesome ballots	Percent
Georgia	138,029	53,489	39%
Michigan	139,190	62,517	45%
Pennsylvania*	165,412	61,780	37%
Wisconsin	96,771	29,594	31%
Arizona	518,560	303,305	58%

*Number for Pennsylvania represent Republican ballots only.

3 Conclusion

There are clearly a large number of troublesome ballots in each state investigated. Ballots marked as not returned that were never requested are clearly an error of some kind. The error is not small as a percent of the total recorded unreturned ballots.

Ballots sent back and unrecorded is a separate error. These represent votes that have gone missing, a serious mistake. The number of these missing ballots is also large in each state.

Survey respondents were not asked if they received an unrequested ballot whether they sent these ballots back. This is clearly a lively possibility, and represents a third possible source of error, including the potential of voting twice (once by absentee and once at the polls). No estimates or likelihood can be calculated for this potential error due to absence of data.

4 Declaration of William M. Briggs, PhD

1. My name is William M. Briggs. I am over 18 years of age and am competent to testify in this action. All of the facts stated herein are true and based on my personal knowledge.
2. I received a Ph.D of Statistics from Cornell University in 2004.
3. I am currently a statistical consultant. I make this declaration in my personal capacity.
4. I have analyzed data regarding responses to questions relating to mail ballot requests, returns and related issues.
5. I attest to a reasonable degree of professional certainty that the resulting analysis are accurate.

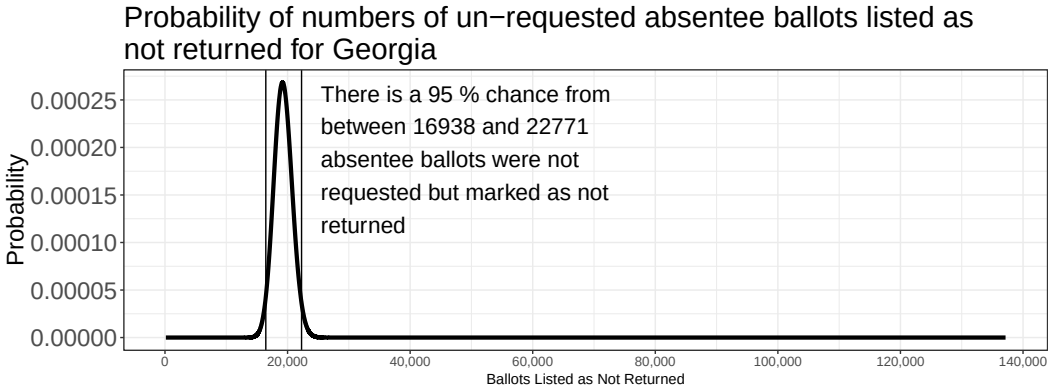
I declare under the penalty of perjury that the foregoing is true and correct.

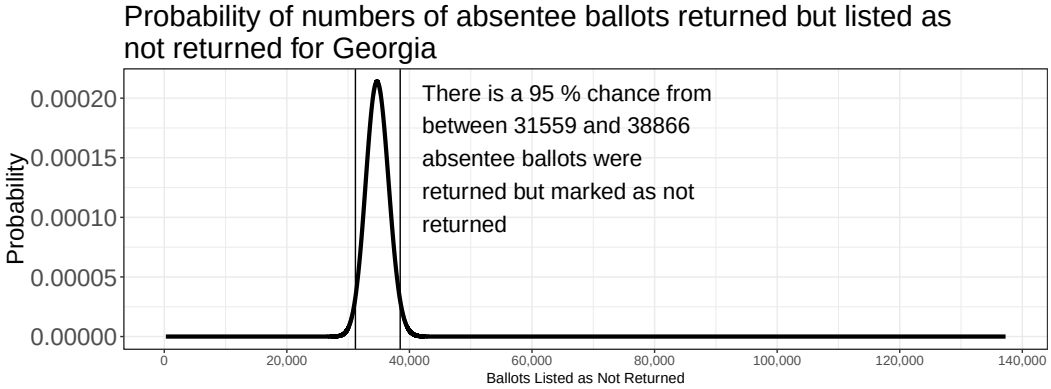
23 November 2020

William M. Briggs

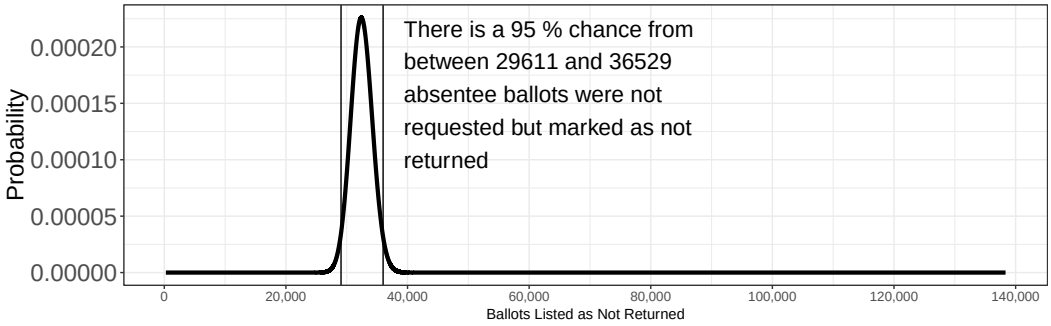
5 Appendix

The probability pictures for each state for each outcome as mentioned above.

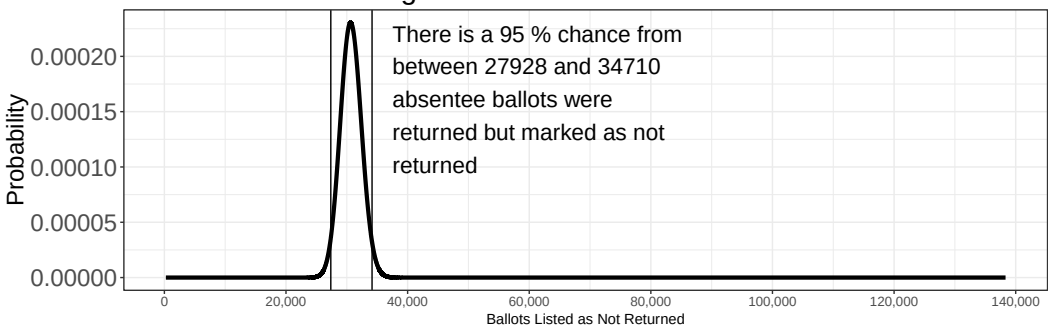




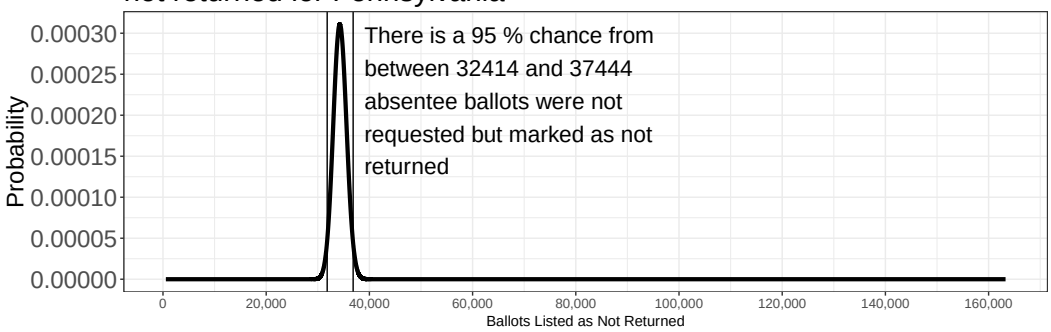
Probability of numbers of un−requested absentee ballots listed as not returned for Michigan



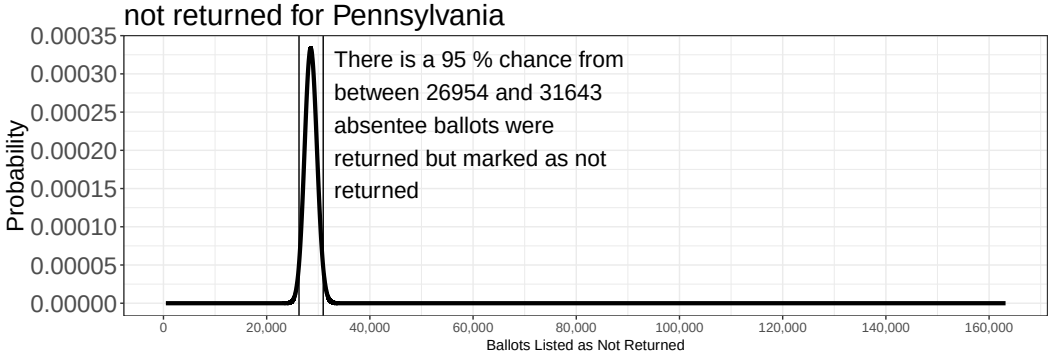
Probability of numbers of absentee ballots returned but listed as not returned for Michigan



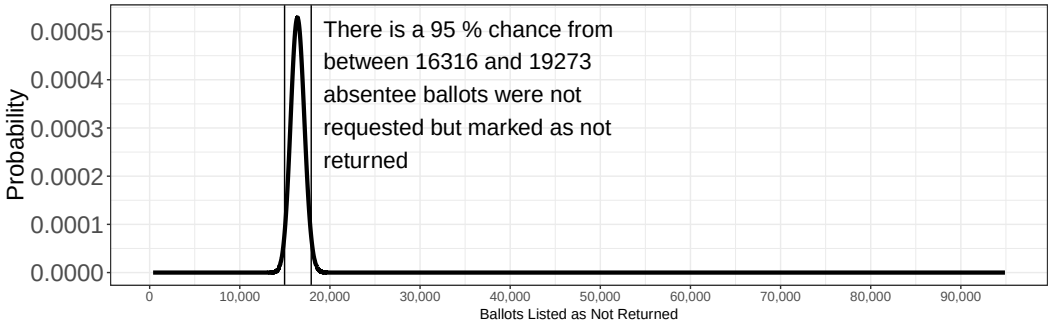
Probability of numbers of un−requested absentee ballots listed as not returned for Pennsylvania



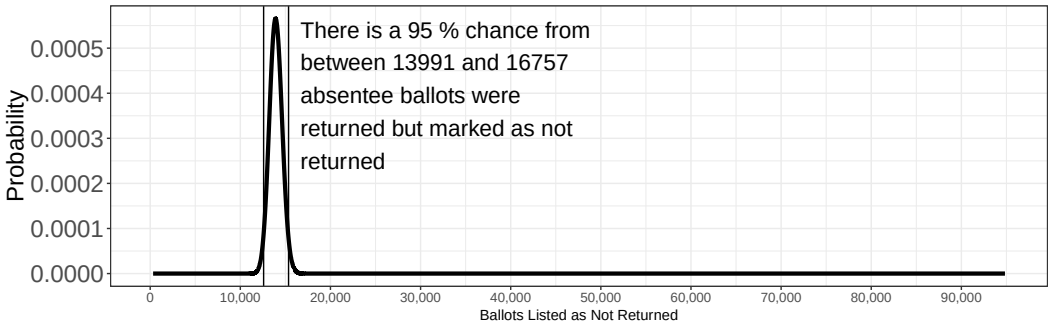
Probability of numbers of absentee ballots returned but listed as not returned for Pennsylvania



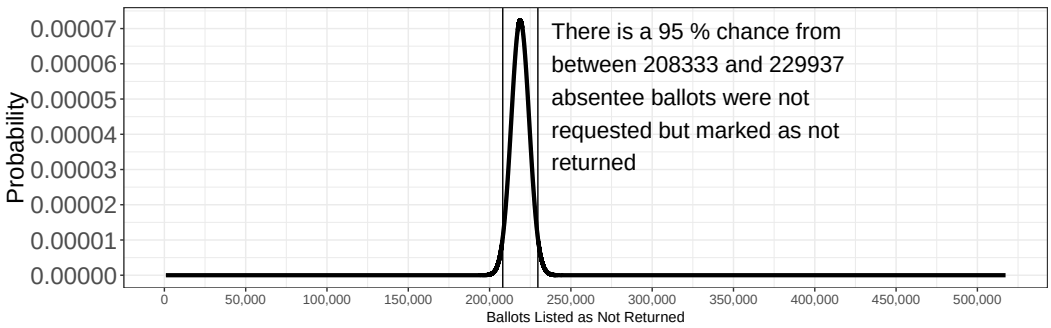
Probability of numbers of un−requested absentee ballots listed as not returned for Wisconsin



Probability of numbers of absentee ballots returned but listed as not returned for Wisconsin



Probability of numbers of un−requested absentee ballots listed as not returned for Arizona



Probability of numbers of absentee ballots returned but listed as not returned for Arizona

William M. Briggs, PhD
Statistician to the Stars!
matt@wmbriggs.com
917-392-0691

1. Experience

(1) 2016: Author of *Uncertainty: The Soul of Modeling, Probability & Statistics*, a book which argues for a complete and fundamental change in the philosophy and practice of probability and statistics. Eliminate hypothesis testing and estimation, and move to verifiable predictions. This includes AI and machine learning. Call this The Great Reset, but a good one.

(2) 2004-2016 Adjunct Professor of Statistical Science, Cornell University, Ithaca, New York
I taught a yearly Masters course to people who (rightfully) hate statistics. Interests: philosophy of science & probability, epistemology, epidemiology (ask me about the all-too-common epidemiologist fallacy), Bayesian statistics, medicine, climatology & meteorology, goodness of forecasts, overconfidence in science; public understanding of science, limitations of science, scientism; scholastic metaphysics (as it relates to epistemology).

(3) 1998-present. Statistical consultant, Various companies
Most of my time is spent coaxing people out of their money to tell them they are too sure of themselves. All manner of analyses cheerfully undertaken. Example: Fraud analysis; I created the *Wall Street Journal's* College Rankings. I consultant regularly at Methodist and other hospitals, start-ups, start-downs, and with any instition willing to fork it over.

(4) 2003-2010. Research Scientist, New York Methodist Hospital, New York
Besides the usual, I sit/sat on the Institutional Review Committee to assess the statistics of proposed research. I was an Associate Editor for *Monthly Weather Review* (through 2011). Also a member of the American Meteorological Society's Probability and Statistics Committee (through 2011). At a hospital? Yes, sir; at a hospital. It rains there, too, you know.

(5) Fall 2007, Fall 2010 Visiting Professor of Statistics, Department of Mathematics, Central Michigan University, Mt. Pleasant, MI
Who doesn't love a visit from a statistician? Ask me about the difference between "a degree" and "an education."

(6) 2003-2007, Assistant Professor Statistics, Weill Medical College of Cornell University, New York, New York
Working here gave me a sincere appreciation of the influences of government money; grants galore.

(7) 2002-2003. Gotham Risk Management, New York
A start-up then, after Enron's shenanigans, a start-down. We set future weather derivative and weather insurance contract prices that incorporated information from medium- and long-range weather and climate forecasts.

(8) 1998-2002. DoubleClick, New York
Lead statistician. Lot of computer this and thats; enormous datasets.

(9) 1993-1998. Graduate student, Cornell University

Meteorology, applied climatology, and finally statistics. Was Vice Chair of the graduate student government; probably elected thanks to a miracle.

(10) 1992-1993. National Weather Service, Sault Ste. Marie, MI
Forecast storms o' the day and launched enormous balloons in the name of Science. My proudest moment came when I was able to convince an ancient IBM-AT machine to talk to an *analog*, 110 baud, phone-coupled modem, all using BASIC!

(11) 1989-1992. Undergraduate student, Central Michigan University
Meteorology and mathematics. Started the local student meteorology group to chase tornadoes. Who knew Michigan had so few? Spent a summer at U Michigan playing with a (science-fiction-sounding) lidar.

(12) 1983-1989. United States Air Force
Cryptography and other secret stuff. Shot things; learned pinochle. I adopted and became proficient with a fascinating and versatile vocabulary. Irritate me for examples. TS/SCI, etc. security clearance (now inactive).

2. Education

(1) Ph.D., 2004, Cornell University. Statistics.
(2) M.S., 1995, Cornell University. Atmospheric Science.
(3) B.S., Summa Cum Laude, 1992, Central Michigan University. Meteorology and Math.

3. Publications

3.0.1. *Popular.*

(1) Op-eds in various newspapers; articles in *Stream*, *Crisis Magazine*, *The Remnant*, *Quadrant*, *Quirks*; blog with ∼70,000 monthly readers. Various briefs submitted to government agencies, such as California Air Resources Board, Illinois Department of Natural Resources. Talks and holding-forths of all kinds.

3.0.2. *Books.*

(1) Richards, JW, WM Briggs, and D Axe, 2020. *UThe Price of Panic: How the Tyranny of Experts Turned a Pandemic into a Catastrophe*. Regnery. Professors Jay Richards, William Briggs, and Douglas Axe take a deep dive into the crucial questions on the minds of millions of Americans during one of the most jarring and unprecedented global events in a generation.

(2) Briggs, WM., 2016. *Uncertainty: The Soul of Modeling, Probability & Statistics*. Springer. Philosophy of probability and statistics. A new (old) way to view and to use statistics, a way that doesn't lead to heartbreak and pandemic over-certainty, like current methods do.

(3) Briggs, WM., 2008 *Breaking the Law of Averages: Real Life Probability and Statistics in Plain English*. Lulu Press, New York. Free text for undergraduates.

Before this Court

EXPERT REPORT OF MATTHEW BRAYNARD

I. INTRODUCTION

I have been retained as an expert witness on behalf of Petitioners in the above captioned proceeding. I expect to testify on the following subject matters: (i) analysis of the database for the November 3, 2020 election for the selection of Presidential Electors in the State of Wisconsin ("State"); (ii) render opinions regarding whether individuals identified in the State's voter database actually voted; and (iii) render opinions regarding whether individuals identified in the State's voter database were actually qualified to vote on election day.

This is a statement of my relevant opinions and an outline of the factual basis for these opinions. The opinions and facts contained herein are based on the information made available to me in this case prior to preparation of this report, as well as my professional experience as an election data analyst.

I reserve the right to supplement or amend this statement on the basis of further information obtained prior to the time of trial or in order to clarify or correct the information contained herein.

II. DOCUMENTS REVIEWED

I reviewed the following documents in arriving at my opinions.

1. The voter records and election returns as maintained on the State's election database;

2. Records maintained by the National Change of Address Source which is maintained by the United States Postal Service and which is available for licensed users on the internet. I am a licensed member.

3. Records developed by the staff of my call centers and social media researchers; and

4. A national voter database maintained by L2 Political;

In addition, I discussed the facts of this matter with Petitioner's attorney Erick G. Kaardal and members of his legal team.

III. PROFESSIONAL QUALIFICATIONS

I have attached hereto as Exhibit 1 a true and correct copy of my resume. As detailed in the resume, I graduated from George Washington University in 2000 with a degree in business administration with a concentration in finance and management information systems. I have been working in the voter data and election administration field since 1996. I have worked building and deploying voter databases for the Republican National Committee, five Presidential campaigns, and no less than one-hundred different campaigns and election-related organizations in all fifty states and the U.S. Virgin Islands. I worked for eight years as a senior analyst at the nation's premier redistricting and election administration firm, Election Data Services, where I worked with states and municipalities on voter databases, delineation, and litigation support related to these matters. Also, while at Election Data Services, I worked under our contract with the US Census Bureau analyzing voting age population. Since 2004, I have worked for my own business, now known as External Affairs, Inc., providing

statistical and data analysis for local, state, and federal candidates and policy organizations in the areas of voter targeting, polling/research, fundraising, branding, and online development and strategy. My firm has worked for over two-hundred candidates from president to town council and over a dozen DC-based policy/advocacy organizations.

With respect to publications I have authored in the last 10 years, I have not authored any publications in the last ten years.

IV. COMPENSATION

I have been retained as an expert witness for Petitioners. I am being compensated for a flat fee of $40,000.

V. PRIOR TESTIMONY

I have not provided testimony as an expert either at trial or in deposition in the last four years.

VI. STATEMENT OF OPINIONS

As set forth above, I have been engaged to provide expert opinions regarding analysis in the November 3, 2020 election of Presidential electors. Based on my review of the documents set forth above, my discussions with statisticians and analysts working with me and at my direction, my discussions with the attorneys representing the Petitioners, I have the following opinions:

1. It is my opinion, to a reasonable degree of scientific certainty, that in the State, the State's database for the November 3, 2020 election show 96,711 voters whom the state marks as having requested and been sent an absentee ballot did not return it. It is my opinion, to a reasonable degree of scientific certainty, that in my sample

of this universe, 18.12% of these absentee voters in the State did not request an absentee ballot.

2. From the State's database for the November 3, 2020 election and our call center results, it is my opinion to a reasonable degree of scientific certainty that 96,771 individuals whom the State's database identifies as having not returned an absentee ballot, that in my sample of this universe, 15.37% of those absentee voters did in fact mail back an absentee ballot to the clerk's office.

3. From the State's database for the November 3, 2020 election, the NCOA database, and our call center results, it is my opinion to a reasonable degree of scientific certainty that out of the 26,673 individuals had changed their address before the election, that in my sample of this universe, 1.11% of those individuals denied casting a ballot.

4. From the State's database for the November 3, 2020 election and the NCOA database and other state's voter databases, it is my opinion to a reasonable degree of scientific certainty, that at least 6,848 absentee or early voters were not residents of the State when they voted.

5. From the State's database for the November 3, 2020 election and my staff's review of social media for voters who applied for indefinitely confined absentee voting status, it is my opinion to a reasonable degree of scientific certainty, that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

6. From the State's database for the November 3, 2020 election and comparing that data to other states voting data and identifying individuals who cast early/absentee ballots in multiple states, it is my opinion to a reasonable degree of scientific certainty, that at least 234 individuals in the State voted in multiple states.

VII. BASIS AND REASONS SUPPORTING OPINIONS.

First, State maintains a database for the November 3, 2020 election which I obtained from L2 Political and which L2 Political obtained from the State's records on, among other things, voters who applied for an absentee or early voter status. I received this database from L2 Political in a table format with columns and rows which can be searched, sorted and filtered. Each row sets forth data on an individual voter. Each

column contained information such as the name of the voter, the voter's address, whether the voter applied for an absentee ballot, whether the voter voted and whether the voter voted indefinitely confined status.

Second, we are able to obtain other data from other sources such as the National Change of Address Database maintained by the United States Postal Service and licensed by L2 Political. This database also in table format shows the name of an individual, the individual's new address, the individual's old address and the date that the change of address became effective.

Third, I conducted randomized surveys of data obtained from the State's database by having my staff or the call center's staff make phone calls to and ask questions of individuals identified on the State's database by certain categories such as absentee voters who did not return a ballot. Our staff, if they talked to any of these individuals, would then ask a series of questions beginning with a confirmation of the individual's name to ensure it matched the name of the voter identified in the State's database. The staff would then ask additional questions of the individuals and record the answers.

Fourth, I had this staff survey a random sample I obtained from the State's database on indefinitely confined voters. The staff conducted research on the internet and social media postings by these individuals. Staff would undertake to determine if the individual was the individual listed on the database meant the State's definition of indefinitely confined. Staff would then attempt to determine if the individuals had posted photos, images or other information demonstrating that the individuals were not indefinitely confined. For instance, if the individual's social media showed a photo on or

near election day of the individual doing something inconsistent with indefinitely confined status such as riding a bike. Staff would then record the results as either "not indefinitely confined," "confirmed indefinitely confined," or "inconclusive."

Fifth, attached as Exhibits 2 is my written analysis of the data obtained.

Below are the opinions I rendered and the basis of the reasons for those opinions.

1. It is my opinion, to a reasonable degree of scientific certainty, that in the State, the State's database for the November 3, 2020 election show 96,711 voters whom the state marks as having requested and been sent an absentee ballot did not return it. It is my opinion, to a reasonable degree of scientific certainty, that in my sample of this universe, 18.12% of these absentee voters in the State did not request an absentee ballot.

I obtained this data from the State via L2 Political after the November 3, 2020, Election Day. This data identified 96,771 absentee voters who were sent an absentee ballot but who failed to return the absentee ballot.

I then had my staff make phone calls to a sample of this universe. When contacted, I had my staff confirm the individual's identity by name. Once the name was confirmed, I then had staff ask if the person requested an absentee ballot or not. Staff then recorded the number of persons who answered yes. My staff then recorded that of the 2,114 individuals who answered the question, 1,731 individuals answered yes to the question whether they requested an absentee ballot. My staff recorded that 383 individuals answered no to the question whether they requested an absentee ballot. Attached as Exhibit 2 is my written analysis containing information from the data above on absentee voters. Paragraph 2 of Exhibit 2 presents this information.

Next, I then had staff ask the individuals who answered yes, they requested an absentee ballot, whether the individual mailed back the absentee ballot or did not mail back the absentee ballot. Staff then recorded that of the 1,626 individuals who answered the question, 325 individuals answered yes, they mailed back the absentee ballot. Staff recorded 1301 individuals answered no, they did not mail back the absentee ballot. Paragraph 2 of Exhibit 2 presents this information.

Based on these results, 18.12% of our sample of these absentee voters in the State did not request an absentee ballot.

2. From the State's database for the November 3, 2020 election and our call center results, it is my opinion to a reasonable degree of scientific certainty that 96,771 individuals whom the State's database identifies as having not returned an absentee ballot, that in my sample of this universe, 15.37% of those absentee voters did in fact mail back an absentee ballot to the clerk's office.

This opinion includes the analysis set forth above. Among the 1,626 who told our call center that they did request an absentee ballot and answered the second question, 325 told our staff that they mailed the absentee ballot back, which is 15.37% of those whom the State identified as having not returned the absentee ballot the State sent them. Paragraph 2 of Exhibit 2 presents this information.

3. From the State's database for the November 3, 2020 election, the NCOA database, and our call center results, it is my opinion to a reasonable degree of scientific certainty that out of the 26,673 individuals had changed their address before the election, that in my sample of this universe, 1.11% of those individuals denied casting a ballot.

On Exhibit 2, in paragraph 4, I took the State's database of all absentee or early voters and matched those voters to the NCOA database for the day after election day.

This data identified 26,673 individuals whose address on the State's database did not match the address on the NCOA database on election day. Next, I had my staff call the persons identified and ask these individuals whether they had voted. My call center staff identified 1,607 individuals who confirmed that they had casted a ballot. My call center staff identified 18 individuals who denied casting a ballot. Our analysis shows that 1.11% of our sample of these individuals who changed address did not vote despite the State's data recorded that the individuals did vote.

4. From the State's database for the November 3, 2020 election and the NCOA data and other state's voter data, it is my opinion to a reasonable degree of scientific certainty, that at least 6,848 absentee or early voters were not residents of the State when they voted.

On Exhibit 2, in paragraph 1, I took the State's database of all absentee or early voters and matched those voters to the NCOA database for the day after Election Day. This data identified 6,207 individuals who had moved of the State prior to Election Day. Further, by comparing the other 49 states voter databases to the State's database, I identified 765 who registered to vote in a state other than the State subsequent to the date they registered to vote in the State. When merging these two lists and removing the duplicates, and accounting for moves that would not cause an individual to lose their residency and eligibility to vote under State law, these voters total 6,848.

5. From the State's database for the November 3, 2020 election and my staff's review of social media for voters who applied for indefinitely confined absentee voting status, it is my opinion to a reasonable degree of scientific certainty, that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

This opinion is taken from data developed on Exhibit 3. For this determination, I had my staff investigate using the internet and social media the individuals the State's data identified as claiming indefinitely confined status in their absentee ballot applications. The staff conducted research on the internet and social media postings by these individuals. Staff would undertake to determine if the individual was the individual listed on the database as indefinitely confined. Staff would then attempt to determine if the individuals had posted photos, images or other information demonstrating that the individuals were not indefinitely confined. For instance, if the individual's social media showed a photo on or near election day doing something inconsistent with indefinitely confined status such as riding a bike. Staff would then record the results as either "not indefinitely confined," "confirmed indefinitely confined," or "inconclusive."

These results showed that of the 213,215 who claimed indefinitely confined absentee voter status in the State, that in my sample of this universe, 45.23% of those individuals were not indefinitely confined on Election Day.

6. From the State's database for the November 3, 2020 election and comparing that data to other states voting data and identifying individuals who cast early/absentee ballots in multiple states, it is my opinion to a reasonable degree of scientific certainty, that at least 234 individuals in the State voted in multiple states.

On Exhibit 2, in paragraph 2, I had my staff compare the State's early and absentee voters to other states voting data and identified individuals who cast early/absentee ballots in multiple states. My staff located 234 individuals who voted in the State and in other states for the November 3, 2020 general election.

VIII. EXHIBITS TO BE USED AT TRIAL TO SUMMARIZE OR EXPLAIN OPINIONS

At the present time, I intend to rely on the documents produced set forth above as possible exhibits.

Matthew Braynard

[redacted]

Pursuant to 28 U.S.C Section 1746, I, [redacted], make the following declaration.

1. I am over the age of 21 years and am a resident of Monroe County, Florida.
2. I am under no legal disability that would prevent me from giving this declaration.
3. I hold a Bachelor of Science degree in Mathematics and a Master of Science degree in Statistics.
4. For thirty years, I have conducted statistical data analysis for companies in various industries, including aerospace, consumer packaged goods, disease detection and tracking, and fraud detection.
5. From November 13th, 2020 through November 28th, 2020, I conducted in-depth statistical analysis of publicly available data on the 2020 U.S. Presidential Election. This data included vote counts for each county in the United States, U.S. Census data, and type of voting machine data provided by the U.S. Election Assistance Committee.
6. The analysis yielded several "red flags" concerning the percentage of votes won by candidate Biden in counties using voting machines provided by Dominion Voting Systems. These red flags occurred in several States in the country, including Wisconsin.
7. I began by using Chi-Squared Automatic Interaction Detection (CHAID), which treats the data in an agnostic way—that is, it imposes no parametric assumptions that could otherwise introduce bias. Here, I posed the following question: "Do any voting machine

types appear to have unusual results?" The answer provided by the statistical technique/algorithm was that machines from Dominion Voting Systems (Dominion) produced abnormal results.

8. Subsequent graphical and statistical analysis shows the unusual pattern involving machines from Dominion occurs in at least 100 counties and multiple States, including Wisconsin.

9. The results from most, if not all counties using the Dominion machines is three to five point six percentage points higher in favor of candidate Biden than the results should be. This pattern is seen easily in graphical form when the results from "Dominion" counties are overlaid against results from "non-Dominion" counties. The results from "Dominion" counties do not match the results from the rest of the counties in the United States. The results are certainly statistically significant, with a p-value of < 0.00004. This translates into a statistical impossibility that something unusual involving Dominion machines is *not* occurring. This pattern appears in multiple States, including Wisconsin, and the margin of votes implied by the unusual activity would easily sway the election results.

10. The following graph shows the pattern. The large red dots are counties in Wisconsin that use Dominion voting machines. Almost all of them are above the blue prediction line, when in normal situations approximately half of them would be below the prediction line (as evidence by approximately half the counties in the U.S. (blue dots) that are below the blue centerline). The p-value of statistical analysis regarding the centerline for the red dots (Wisconsin counties

with Dominion machines) is 0.000000049, pointing to a statistical impossibility that this is a "random" statistical anomaly. Some external force caused this anomaly

11. To confirm that Dominion machines were the source of the pattern/anomaly, I conducted further analysis using propensity scoring using U.S. census variables (Including ethnicities, income, professions, population density and other social/economic data) , which was used to place counties into paired groups. Such an analysis is important because one concern could be that counties with Dominion systems are systematically different from their counterparts, so abnormalities in the margin for Biden are driven by other characteristics unrelated to the election.

12. After matching counties using propensity score analysis, the only difference between the groups was the presence of Dominion machines. This approach again showed a highly statistically significant difference between the two groups, with candidate Biden again averaging three percentage points higher in Dominion counties than in the associated paired county. The associated p-value is < 0.00005, against indicating a statistical impossibility that something unusual is not occurring involving Dominion machines.

13. The results of the analysis and the pattern seen in the included graph strongly suggest a systemic, system-wide algorithm was enacted by an outside agent, causing the results of Wisconsin's vote tallies to be inflated by somewhere between three and five point six percentage points. Statistical estimating yields that in Wisconsin, the best estimate of the number of impacted votes is 181,440. However, a 95% confidence interval calculation yields that as many as 236,520 votes may have been impacted.

I declare under penalty of perjury that the forgoing is true and correct. Executed this November 28th, 2020.

[redacted],

STATE OF COLORADO)
)ss.
County of Douglas)

COMES NOW, Affiant Joseph T. Oltmann, being first duly sworn, under oath, and states under penalty of perjury that the following information is true and accurate within his personal knowledge and belief:

My name Joseph Oltmann. I am over eighteen years of age. I am not suffering under any mental disability and am competent to give this worn affidavit. I am able to read and write and to give this affidavit voluntarily and on my own free will and accord. No one has used any threats, force, pressure, or intimidation to male me sign this affidavit. I make this affidavit in support of the truth.

I am the CEO of a tech company based just outside of Denver, Colorado. I am also the founder of an organization called FEC United. [Fecunited.com] The goal of this organization is to restore constitutional integrity to our community and empower those in our community to stand up to state and national leadership that intends to suppress the rights of individuals holistically.

Through this organization "FEC" I became a target of journalists who began to slander both me and my organization. I became the topic of Antifa and extremists through my involvement in a movement to resist the narrative that police are bad and our society represented the rhetoric shared by these extremists. As a result of these attacks, I started researching Antifa, BLM, Inc. and their connection to violence and unrest inside of our communities. As a result, I set out to infiltrate Antifa meetings and de-mask those Antifa members who are journalists in the mainstream media in Colorado specifically.

On or about the week of September 27, 2020, I was able to attend an Antifa meeting which appeared to be between Antifa members in Colorado Springs and in Denver Colorado. I cannot verify the connection between the two or the leadership as they were disorganized. Discussions of Our Revolution and Antifa were discussed. Rhetoric of "eliminating fascists" and frustration as to the dwindling of support to rally in the street was evident.

Then I honed in among other conversations key actors in the organization who work for local and state news publications. One such person of interest was Heidi Beedle, identified leader of Our Revolution in El Paso County (Southern Colorado) and Antifa leader of the same area.

Heidi's name is actually Sean Beedle. She is a journalist at Colorado Springs Independent, Colorado Springs Business Journal and a freelance writer for several online publications. Others to remain unnamed in this were present.

The conversation went like this:

Someone identified as "Eric" began to speak. Someone asked who Eric was, and someone else replied "he is the Dominion guy" [paraphrased].

Eric then began to speak after being told to continue, but was interrupted and asked by someone, "What are we going to do if Trump wins this fucking election?"

Eric responded, "Don't worry about the election. Trump is not going to win. I made fucking sure of that.. Hahaha"

Someone responded, "Fucking right."

Eric continued with fortifying the groups and recruiting. I would describe his tone as eccentric and boisterous. I wrote down his name and started to do some research into him.

At the time, I thought that they were so disconnected with reality that they think they can "make sure Trump is not elected."

I started with a simple google search: Keywords: "Eric," "Dominion," "Denver Colorado." The fifth result in organic search returned:

Dominion Voting Systems | Employee Profiles, Emails, Mutual ...

www.leadcandy.io › company › Dominion-Voting-Syst...

Find people working at Dominion Voting Systems. LeadCandy provides Full ... Denver, Colorado. VIEW FULL PROFILE ... FULL PROFILE. Eric Coomer's photo ...

Above that were results for Eric Schussler- Old Dominion University and Eric E Johnson, Attorney - Sherman & Howard. The first two on organic search however was as follows:

Dominion - Colorado Secretary of State

Eric Coomer's email & phone | Dominion Voting Systems's ...

rocketreach.co › eric-coomer-email_7112825

Location, **Denver, Colorado**, United States. Work, Director, Market Strategy @ **Dominion** Voting Systems Member, Board of Directors @ Friends of Levitt Pavilion ...

I began doing research on Eric Coomer and discovered that Colorado Secretary of state link the following about Dr. Eric Coomer on page 26:

"Eric Coomer graduated from the University of California, Berkeley in 1997 with a Ph.D. in Nuclear Physics. After working in IT consulting for several years, Eric entered the elections industry in 2005 with Sequoia Voting Systems as Chief Software Architect. After three years with the company, Eric took over all development operations as Vice President of Engineering. When Sequoia was acquired by Dominion Voting Systems in 2010, Eric joined the DVS team as Vice President of US Engineering overseeing development in the Denver, Colorado office.

Recently, Eric has taken over as the Director of Product Strategy driving the creation of next generation products through close collaboration with customers, combined with a deep understanding of technology and the needs of Elections departments throughout the United States and abroad. Eric has been an active participant in the development of the IEEE common data format for Elections systems, as well as the working group for developing standards for Risk-Limiting Audits for elections results. When not designing new products, Eric supports large and small scale customers during Election season."

I did some cursory research on Eric, but my conclusion was that he was either a part of the government or not relevant to the conversation. In other words, this was not a target I would

identify as being influential in Antifa. My conclusion was based on his credentials of having a PhD in Nuclear Physics. Did not add up for someone with that intelligence. I set it aside and concentrated my focus on the activist journalist who were actually Antifa members.

On October 15, 2020 I spoke at an FEC meeting in Bandimere Speedway. It was a rally around the unconstitutional actions of Jefferson County, Colorado government leadership to hurt Bandimere Speedway. I spoke and before the event started they escorted a suspected Antifa Journalist Erik Maulbetsch [Colorado Recorder] off the premises. In that meeting I talked about outing activist journalists who were Antifa and holding them accountable in our community for attacking organizations like FEC United that serve the community.

These activist journalists frequently slander people of faith, conservatives and call them names that defame them in the community. I had enough and warned that we would call them out by name. Maulbetsch wrote and article reflecting this as he was listening in online and decided to omit details about the meeting, causing the entire journalistic community to wonder if they were on the list. It had a positive effect contrary to their intentions.

On Friday November 6th, I received a forwarded a article about Georgia irregularities on the election day. I normally do not read many of these articles because I am inundated with information both from FEC, and my company. I started reading it and noticed Eric Coomer was the spokesperson for a company called Dominion Voting Systems. I immediately stopped and started to go back through my notes to find the info on Eric Coomer. I then started research Dominion Voting Systems. The information became rather scary as everywhere I looked I found Eric's name. Some listing him as VP of Security and others calling him Director of Strategy and Security. I began my search for everything Eric Coomer, Dr. Eric Coomer and any information related to legal filings, RFPs, states using Dominion, Colorado uses and even areas in Colorado that do not use Dominion.

I then turned my attention to Eric Coomer's Facebook profile and page while I gathered information on correlating email addresses, profiles, screen names, etc. Searching Twitter, Reddit, Facebook, 4Chan, etc etc.

I was able to get screenshots of Eric Coomer's Facebook posts going back to 2016. What I discovered was disturbing. Anti-Trump rhetoric, posts referring to: Fuck USA, Fuck the Police, A.C.A.B., posts that were anti Conservative, and even posts being happy someone died. Then the bigger shocker. He reposted the Antifa "Manifesto" letter to Donald Trump. I knew that I had the right guy and someone that was clearly mentally unstable and radical. I started digging into the

code irregularities and tying all of the pieces together with the irregularities and the Dominion uses in the disputed states. The correlation was astonishing. I then found the information related to justifying voting machines being online and his justification that they had "hardware and IP address protection". This statement by itself is FALSE.

I then attempted to reach out to all sources to bring this information to light. Calling major news stations and attempting to connect with the DOJ.

I took the information to the listeners of an organization that I also own called Conservative Daily. We have a podcast that we do on weekdays. I felt I had enough information and was confident that the Eric on the conference call was the same Eric Coomer that worked for Dominion. I was also confident that given the Facebook and other information I was able to collect that Eric Coomer was interfering with the election and as he admits in one of his posts that people at his company think and feel the same way he does. I began to research his patents, who owns them, the pattern of states they acquired as clients.

I began to research the connection to Diane Feinstein, her husband, campaign manager, Clinton Foundation and became worried that the finger of radicals had taken away the voice of the American people in deciding the election. I used ARIMA analysis to show me trends on data and probability models to prove that they were in fact using code and technology to ghost votes, switch votes or even remove probable ballots completely. Code is random unless it is not. Since we are a data company and understand artificial intelligence and use of neural networks, we understand the capabilities of creating chaos in outcome based on weighted density of probable voters.

These statements are true and accurate to the best of my knowledge.

Joseph Oltmann

STATE OF COLORADO

DECLARATION OF HARRI HURSTI

Pursuant to 28 U.S.C. § 1746, I declare under penalty of perjury that the foregoing is true and correct.

1. My name is Harri Hursti. I am over the age of 21 and competent to give this testimony. The facts stated in this declaration are based on my personal knowledge, unless stated otherwise.

2. My background and qualifications in voting system cybersecurity are set forth in my December 16, 2019 declaration. (Doc. 680-1, pages 37 *et seq*). I stand by everything in that declaration and in my August 21, 2020 declaration. (Doc. 800-2).

3. I am also an expert in ballot scanning because of extensive background in digital imaging prior by work researching election systems. In addition, in 2005 I started an open source project for scanning and auditing paper ballots from images. As a result, I am familiar with different scanner types, how scanner settings and image processing features change the images, and how file format choices affect the quality and accuracy of the ballots.

4. I am engaged as an expert in this case by Coalition for Good Governance.

5. In developing this declaration and opinion, I visited Atlanta to observe certain operations of the June 9, 2020 statewide primary, and the August 11 runoff. During the June 9 election, I was an authorized poll watcher in some locations and was a public observer in others. On August 11, I was authorized as an expert inspecting and observing under the Coalition for Good Governance's Rule 34 Inspection request in certain polling places and the Fulton County Election Preparation Center. As I will explain below in this declaration, my extensive experience in the area of voting system security and my observations of these elections lead to additional conclusions beyond those in my December 16, 2019 declaration. Specifically:

a) the scanner and tabulation software settings being employed to determine which votes to count on hand marked paper ballots are likely causing clearly intentioned votes not to be counted;

b) the voting system is being operated in Fulton County in a manner that escalates the security risk to an extreme level; and

c) voters are not reviewing their BMD printed ballots, which causes BMD generated results to be un-auditable due to the untrustworthy audit trail.

Polling Place Observations

6. Election observation on Peachtree Christian Church. The ballot marking devices were installed so that 4 out of 8 touchscreen devices were clearly visible from the pollbook check in desk. Voter's selections could be effortlessly seen from over 50 ft away.

7. Over period of about 45 minutes, I only observed one voter who appeared to be studying the ballot after picking it up from the printer before casting it in the scanner. When voters do not fully verify their ballot prior to casting, the ballots cannot be considered a reliable auditable record.

8. The scanner would reject some ballots and then accept them after they were rotated to a different orientation. I noted that the scanner would vary in the amount of time that it took to accept or reject a ballot. The delay varied between 3

and 5 seconds from the moment the scanner takes the ballot until the scanner either accepts the ballot or rejects it. This kind of behavior is normal on general purpose operating systems multitasking between multiple applications, but a voting system component should be running only a single application without outside dependencies causing variable execution times.

9. Further research is necessary to determine the cause of the unexpected scanning delays. A system that is dedicated to performing one task repeatedly should not have unexplained variation in processing time. As security researcher, we are always suspicious about any unexpected variable delays, as those are common telltale signs of many issues, including a possibility of unauthorized code being executed. So, in my opinion changes of behaviors between supposedly identical machines performing identical tasks should always be investigated.

When ballots are the same and are produced by a ballot marking device, there should be no time difference whatsoever in processing the bar codes. Variations in time can be the result of many things - one of them is that the scanner encounters an error reading the bar code and needs to utilize error correcting algorithms to recover from that error. Further investigation is

necessary to determine the root cause of these delays, the potential impact of the error correcting algorithms if those are found to be the cause, and whether the delay has any impact upon the vote.

10. Election observation in Central Park Recreation Center. The Poll place manager told me that no Dominion trained technician had reported on location to help them that morning.

11. The ballot marking devices were originally installed in a way that voter privacy was not protected, as anyone could observe across the room how people are voting on about 2/3 devices.

12. The ballot scanner took between 4 and 6 seconds to accept the ballot. I observed only one ballot being rejected.

13. Generally, voters did not inspect the ballots after taking it from the printer and casting it into the scanner.

14. Election observation in Fanplex location. Samantha Whitley and Harrison Thweatt were poll watchers at the Fanplex polling location. They contacted me at approximately 9:10am about problems they were observing with the operation of the BMDs and Poll Pads and asked me to come to help them

understand the anomalies they were observing. I arrived at FanPlex at approximately 9:30am.

15. I observed that the ballot scanner located by a glass wall whereby standing outside of the building observe the scanning, would take between 6 and 7 seconds to either accept or reject the ballot.

16. For reasons unknown, on multiple machines, while voters were attempting to vote, the ballot marking devices sometimes printed "test" ballots. I was not able to take a picture of the ballot from the designated observation area, but I overheard the poll worker by the scanner explaining the issue to a voter which was sent back to the Ballot-Marking Device to pick up another ballot from the printer tray. Test ballots are intended to be used to test the system but without being counted by the system during an election. The ballot scanner in election settings rejects test ballots, as the scanners at FanPlex did. This caused confusion as the voters needed to return to the ballot-marking device to retrieve the actual ballot. Some voters returned the test ballot into the printer tray, potentially confusing the next voter. Had voters been reviewing the ballots at all before taking them to the scanner, they would have noticed the "Test Ballot" text on the ballot. I observed no voter really questioning a poll worker why a "Test" ballot was printed in the first place.

17. Obviously, during the election day, the ballot marking device should not be processing or printing any ballot other than the one the voter is voting. While the cause of the improper printing of ballots should be examined, the fact that this was happening at all is likely indicative of a wrong configuration given to the BMD, which in my professional opinion raises another question: Why didn't the device print only test ballots? And how can the device change its behavior in the middle of the election day? Is the incorrect configuration originating from the Electronic Pollbook System? What are the implications for the reliability of the printed ballot and the QR code being counted?

18. Election observation Park Tavern. The scanner acceptance delay did not vary as it had in previous locations and was consistently about 5 seconds from the moment the scanner takes the ballot, to the moment the scanner either accepts the ballot or rejects it. The variation between scanners at different locations is concerning because these are identical physical devices and should not behave differently while performing the identical task of scanning a ballot.

19. The vast majority of voters at Park Tavern did not inspect the ballots after taking them from the printer and before casting them in the scanner.

Fulton Tabulation Center Operation-Election Night, August 11, 2020

20. In Fulton County Election Preparation Center ("EPC") on election night I reviewed certain operations as authorized by Rule 34 inspection.

21. I was permitted to view the operations of the upload of the memory devices coming in from the precincts to the Dominion Election Management System ("EMS") server. The agreement with Fulton County was that I could review only for a limited period of time; therefore, I did not review the entire evening's process. Also, Dominion employees asked me to move away from the monitors containing the information and messages from the upload process and error messages, limiting my ability to give a more detailed report with documentation and photographs of the screens. However, my vantage point was more than adequate to observe that system problems were recurring and the Dominion technicians operating the system were struggling with the upload process.

22. It is my understanding the same EMS equipment and software had been used in Fulton County's June 9, 2020 primary election.

23. It is my understanding that the Dominion technician ("Dominic") charged with operating the EMS server for Fulton County had been performing

these duties at Fulton County for several months, including during the June 9 primary.

24. During my August 11 visit, and a follow-up visit on August 17, I observed that the EMS server was operated almost exclusively by Dominion personnel, with little interaction with EPC management, even when problems were encountered. In my conversations with Derrick Gilstrap and other Fulton County Elections Department EPC personnel, they professed to have limited knowledge of or control over the EMS server and its operations.

25. Outsourcing the operation of the voting system components directly to the voting system vendors' personnel is highly unusual in my experience and of grave concern from a security and conflict of interest perspective. Voting system vendors' personnel have a conflict of interest because they are not inclined to report on, or address, defects in the voting systems. The dangers this poses is aggravated by the absence of any trained County personnel to oversee and supervise the process.

26. In my professional opinion, the role played by Dominion personnel in Fulton County, and other counties with similar arrangements, should be considered an elevated risk factor when evaluating the security risks of Georgia's voting system.

27. Based on my observations on August 11 and August 17, Dell computers running the EMS that is used to process Fulton county votes appeared not to have been hardened.

28. In essence, hardening is the process of securing a system by reducing its surface of vulnerability, which is larger when a system performs more functions; in principle it is to the reduce the general purpose system into a single-function system which is more secure than a multipurpose one. Reducing available ways of attack typically includes changing default passwords, the removal of unnecessary software, unnecessary usernames or logins, grant accounts and programs with the minimum level of privileges needed for the tasks and create separate accounts for privileged operations as needed, and the disabling or removal of unnecessary services.

29. Computers performing any sensitive and mission critical tasks such as elections should unquestionably be hardened. Voting system are designated by the Department of Homeland Security as part of the critical infrastructure and certainly fall into the category of devices which should be hardened as the most fundamental security measure. In my experience, it is unusual, and I find it unacceptable for an EMS server not to have been hardened prior to installation.

30. The Operating System version in the Dominion Election Management computer, which is positioned into the rack and by usage pattern appears to be the main computer, is Windows 10 Pro 10.0.14393. This version is also known as the Anniversary Update version 1607 and it was released August 2, 2016. Exhibit A is a true and correct copy of a photograph that I took of this computer.

31. When a voting system is certified by the EAC, the Operating System is specifically defined, as Windows 10 Pro was for the Dominion 5.5-A system. Unlike consumer computers, voting systems do not and should not receive automatic "upgrades" to newer versions of the Operating System. without undergoing tests for conflicts with the new operating system software.

32. That computer and other computers used in Georgia's system for vote processing appear to have home/small business companion software packages included. Exhibits B and C are true and correct copies of photographs that I took of the computer located in the rack and the computer located closest to the rack on the table to the right. The Start Menu shows a large number of game and entertainment software icons. As stated before, one of the first procedures of hardening is removal of all unwanted software, and removal of those game icons and the associated games and installers alongside with all other software which is not absolutely needed in the computer for election processing purposes would be

one of the first and most basic steps in the hardening process. In my professional opinion, independent inquiry should be promptly made of all 159 counties to determine if the Dominion systems statewide share this major deficiency.

33. Furthermore, when I asked the Dominion employee Dominic assigned to the Fulton County election server operation about the origin of the Windows operating system, he answered that he believed that "it has been provided by the State."

34. Since Georgia's Dominion system is new, it is a reasonable assumption that all machines in the Fulton County election network had the same version of Windows installed. However, not only the two computers displayed different entertainment software icons, but additionally one of the machines in Fulton's group of election servers had an icon of computer game called "*Homescapes"* which is made by Playrix Holding Ltd., founded by Dmitry and Igor Bukham in Vologda, Russia. Attached as Exhibit C is a true and correct copy of a photograph that I took of the Fulton voting system computer" Client 02". The icon for Homescapes is shown by the arrow on Exhibit C.

35. The *Homescapes* game was released in August 2017, one year after Fulton County's operating system release. If the *Homescapes* game came with the operating system it would be unusual, because at the time of the release of

Homescapes, Microsoft had already released 3 major Microsoft Windows 10 update releases after build 14393 and before the release of that game. This calls into question whether all Georgia Dominion system computers have the same operating system version, or how the game has come to be having a presence in Fulton's Dominion voting system.

36. Although this Dominion voting system is new to Georgia, the Windows 10 operating system of at least the 'main' computer in the rack has not been updated for 4 years and carries a wide range of well-known and publicly disclosed vulnerabilities. At the time of this writing, The National Vulnerability Database maintained by National Institute of Standards and Technology lists 3,177 vulnerabilities mentioning "Windows 10 Pro" and 203 vulnerabilities are specifically mentioning "Windows 10 Pro 1607" which is the specific version number of the build 14393 that Dominion uses.

37. Even without internet connectivity, unhardened computers are at risk when those are used to process removable media. It was clear that when Compact Flash storage media containing the ballot images, audit logs and results from the precinct scanners were connected to the server, the media was automounted by the operating system. When the operating system is automounting a storage media, the operating system starts automatically to interact with the device. The zero-day

vulnerabilities exploiting this process has been recurringly discovered from all operating systems, including Windows. Presence of automount calls also into question presence of another setting which is always disabled in hardening process. It is autorun, which automatically executes some content on the removable media. While this is convenient for consumers, it poses extreme security risk.

38. Based on my experience and mental impression observing the Dominion technician's activities, Fulton County's EMS server management seems to be an *ad hoc* operation with no formalized process. This was especially clear on the manual processing of the memory cards storage devices coming in from the precincts on election night and the repeated access of the operating system to directly access filesystem, format USB devices, etc. This kind of operation in naturally prone to human errors. I observed personnel calling on the floor asking if all vote carrying compact flash cards had been delivered from the early voting machines for processing, followed by later finding additional cards which had been overlooked in apparent human error. Later, I heard again one technician calling on the floor asking if all vote carrying compact flashes had been delivered. This clearly demonstrates lack of inventory management which should be in place to ensure, among other things, that no rogue storage devices would be inserted into the computer. In response, 3 more compact flash cards were hand-delivered. Less

than 5 minutes later, I heard one of the county workers say that additional card was found and was delivered for processing. All these devices were trusted by printed label only and no comparison to an inventory list of any kind was performed.

39. In addition, operations were repeatedly performed directly on the operating system. Election software has no visibility into the operations performed directly on the operating system, and therefore those are not included in election system event logging. Those activities can only be partially reconstructed from operating system logs – and as these activities included copying election data files, election software log may create false impression that the software is accessing the same file over a period of time, while in reality the file could had been replaced with another file with the same name by activities commanded to the operating system. Therefore, any attempt to audit the election system operated in this manner must include through analysis of all operating system logs, which complicates the auditing process. Unless the system is configured properly to collect file system auditing data is not complete. As the system appears not to be hardened, it is unlikely that the operating system has been configured to collect auditing data.

40. A human error when operating live election system from the operating system can result in a catastrophic event destroying election data or even rendering the system unusable. Human error is likely given the time pressure involved and,

at least in Fulton County, no formal check lists or operating procedures were followed to mitigate the human error risk. The best practice is to automate trivial tasks to reduce risk of human error, increase the quality assurance of overall operations and provide auditability and transparency by logging.

41. Uploading of memory cards had already started before I arrived at EPC. While one person was operating the upload process, the two other Dominion employees were troubleshooting issues which seemed to be related to ballot images uploads. I repeatedly observed error messages appearing on the screen of the EMS server. I was not able to get picture of the errors on August 11th, I believe the error was the same or similar that errors recurring August 17th as shown on Exhibit D and discussed later in this declaration. Dominion employees were troubleshooting the issue with 'trial-and-error' approach. As part of this effort they accessed "Computer Management" application of Windows 10 and experimented with trouble shooting the user account management feature. This demonstrates that they had complete access to the computer. This means there are no meaningful access separation and privileges and roles controls protecting the county's primary election servers. This also greatly amplifies the risk of catastrophic human error and malicious program execution.

42. I overheard the Dominion technician's conversation that they had issues with file system structure and "need 5 files out of EMS server and paste. Delete everything out of there and put it there." To communicate the gravity of the situation to each other they added "Troubleshooting in the live environment". These conversations increased the mental image that they were not familiar the issue they were troubleshooting.

43. After about 45 minutes of trying to solve the issue by instructions received over the phone, the two Dominion employees' (who had been troubleshooting) behavior changed. The Dominion staff member walked behind the server rack and made manual manipulations which could not be observed from my vantage point. After that they moved with their personal laptops to a table physically farther away from the election system and stopped trying different ways to work around the issue in front of the server, and no longer talked continuously with their remote help over phone.

44. In the follow-up-calls I overheard them ask people on the other end of the call to check different things, and they only went to a computer and appeared to test something and subsequently take a picture of the computer screen with a mobile phone and apparently send it to a remote location.

45. Based on my extensive experience, this all created a strong mental impression that the troubleshooting effort was being done remotely over remote access to key parts of the system. Additionally, new wireless access point with a hidden SSID access point name appeared in the active Wi-Fi stations list that I was monitoring, but it may have been co-incidental. Hidden SSIDs are used to obscure presence of wireless networking from casual observers, although they do not provide any real additional security.

46. If in fact remote access was arranged and granted to the server, this has gravely serious implications for the security of the new Dominion system. Remote access, regardless how it is protected and organized is always a security risk, but furthermore it is transfer of control out of the physical perimeters and deny any ability to observe the activities.

47. I also observed USB drives marked with the Centon DataStick Pro Logo with no visible inventory control numbering system being taken repeatedly from the EMS server rack to the Fulton managers' offices and back. The Dominion employee told me that the USB drives were being taken to the Election Night Reporting Computer in another office. This action was repeated several times during the time of my observation. Carrying generic unmarked and therefore unidentifiable media out-of-view and back is a security risk – especially when the

exact same type of devices was piled on the desk near the computer. During the election night, the Dominion employees reached to storage box and introduced more unmarked storage devices into the ongoing election process. I saw no effort made to maintain a memory card inventory control document or chain of custody accounting for memory cards from the precincts.

48. I also visited the EPC on August 17. During that visit, the staff working on uploading ballots for adjudication experienced an error which appeared similar to the one on election night. This error was repeated with multitude of ballots and at the time we left the location, the error appeared to be ignored, rather that resolved. (EXHIBIT D - the error message and partial explanation of the error being read by the operator.).

49. The security risks outlined above – operating system risks, the failure to harden the computers, performing operations directly on the operating systems, lax control of memory cards, lack of procedures, and potential remote access, are extreme and destroy the credibility of the tabulations and output of the reports coming from a voting system.

50. Such a risk could be overcome if the election were conducted using hand marked paper ballots, with proper chain of custody controls. For elections conducted with hand marked paper ballots, any malware or human error involved

in the server security deficiencies or malfunctions could be overcome with a robust audit of the hand marked paper ballots and in case of irregularities detected, remedied by a recount. However, given that BMD ballots are computer marked, and the ballots therefore unauditable for determining the result, no recovery from system security lapses is possible for providing any confidence in the reported outcomes.

Ballot Scanning and Tabulation of Vote Marks

51. I have been asked to evaluate the performance and reliability of Georgia's Dominion precinct and central count scanners in the counting of votes on hand marked paper ballots.

52. On or about June 10th, Jeanne Dufort and Marilyn Marks called me to seek my perspective on what Ms. Dufort said she observed while serving as a Vote Review Panel member in Morgan County. Ms. Dufort told me that she observed votes that were not counted as votes nor flagged by the Dominion adjudication software.

53. Because of the ongoing questions this raised related to the reliability of the Dominion system tabulation of hand marked ballots, I was asked by Coalition Plaintiffs to conduct technical analysis of the scanner and tabulation accuracy. That analysis is still in its early stages.

54. Before addressing the particulars of my findings and research into the accuracy of Dominion's scanning and tabulation, I will address the basic process by which an image on a voted hand marked paper ballot is processed by scanner and tabulation software generally. It is important to understand that the Dominion scanners are Canon off the shelf scanners and their embedded software were designed for different applications than ballot scanning which is best conducted with scanners specifically designed for detecting hand markings on paper ballots.

55. Contrary of public belief, the scanner is not taking a picture of the paper. The scanner is illuminating the paper with a number of narrow spectrum color lights, typically 3, and then using software to produce an approximation what the human eye would be likely to see if there would had been a single white wide-spectrum light source. This process takes place in partially within the scanner and embedded software in the (commercial off the shelf) scanner and partially in the driver software in the host computer. It is guided by number of settings and configurations, some of which are stored in the scanner and some in the driver software. The scanner sensors gather more information than will be saved into the resulting file and another set of settings and configurations are used to drive that part of the process. The scanners also produce anomalies which are automatically removed from the images by the software. All these activities are performed

outside of the Dominion election software, which is relying on the end product of this process as the input.

56. I began reviewing Dominion user manuals in the public domain to further investigate the Dominion process.

57. On August 14, I received 2 sample Fulton County August 11 ballots of high-speed scanned ballot from Rhonda Martin, who stated that she obtained them from Fulton County during Coalition Plaintiff's discovery. The image characteristics matched the file details I had seen on the screen in EPC. The image is TIFF format, about 1700 by 2200 pixels with 1-bit color depth (= strictly black or white pixels only) with 200 by 200 dots per square inch ("dpi") resolution resulting in files that are typically about 64 or 73 kilo bytes in size for August 11 ballots. With this resolution, the outer dimension of the oval voting target is about 30 by 25 pixels. The oval itself (that is, the oval line that encircles the voting target) is about 2 pixels wide. The target area is about 450 pixels; the area of the target a tight bounding box would be 750 pixels and the oval line encircling the target is 165 pixels. In these images, the oval itself represented about 22% value in the bounding box around the vote target oval.

58. Important image processing decisions are done in scanner software and before election software threshold values are applied to the image. These

scanner settings are discussed in an excerpt Dominion's manual for ICC operations My understanding is that the excerpt of the Manual was received from Marilyn Marks who stated that she obtained it from a Georgia election official in response to an Open Records request. Attached as Exhibit E is page 9 of the manual. Box number 2 on Exhibit E shows that the settings used are not neutral factory default settings.

59. Each pixel of the voters' marks on a hand marked paper ballot will be either in color or gray when the scanner originally measures the markings. The scanner settings affect how image processing turns each pixel from color or gray to either black or white in the image the voting software will later process. This processing step is responsible for major image manipulation and information reduction before the election software threshold values are calculated. This process has a high risk of having an impact upon how a voter mark is interpreted by the tabulation software when the information reduction erases markings from the scanned image before the election software processes it.

60. In my professional opinion, any decision by Georgia's election officials about adopting or changing election software threshold values is premature before the scanner settings are thoroughly tested, optimized and locked.

61. The impact of the scanner settings is minimal for markings made with a black felt pen but can be great for markings made with any color ballpoint pens. To illustrate this, I have used standard color scanning settings and applied then standard conversion from a scanned ballot vote target with widely used free and open source image processing software "GNU Image Manipulation Program version 2.10.18" EXHIBIT G shows the color image being converted with the software's default settings from color image to Black-and-White only. The red color does not meet the internal conversion algorithm criteria for black, therefore it gets erased to white instead.

62. Dominion manual for ICC operations clearly show that the scanner settings are changed from neutral factory default settings. EXHIBIT H shows how these settings applied different ways alter how a blue marking is converted into Black-and-White only image.

63. The optimal scanner settings are different for each model of scanner and each type of paper used to print ballots. Furthermore, because scanners are inherently different, the manufacturers use hidden settings and algorithms to cause neutral factory settings to produce similar baseline results across different makes and models. This is well-studied topic; academic and image processing studies published as early as 1979 discuss the brittleness of black-or-white images in

conversion. Subsequently, significance for ballot counting has been discussed in academic USENIX conference peer-reviewed papers.

64. On the August 17th at Fulton County Election Preparation Center Professor Richard DeMillo and I participated in a scan test of August 11 test ballots using a Fulton County owned Dominion precinct scanner. Two different ballot styles were tested, one with 4 races and one with 5 races. Attached as Exhibits I and J show a sample ballots with test marks.

65. A batch of 50 test ballots had been marked by Rhonda Martin with varying types of marks and varying types of writing instruments that a voter might use at home to mark an absentee ballot. Professor DeMillo and I participated in marking a handful of ballots.

66. Everything said here concerning the August 17 test is based on a very preliminary analysis. The scanner took about 6 seconds to reject the ballots, and one ballot was only acceptable "headfirst" while another ballot only "tail first." Ballot scanners are designed to read ballots "headfirst" or "tail first," and front side and backside and therefore there should not be ballots which are accepted only in one orientation. I observed the ballots to make sure that both ballots had been cleanly separated from the stub and I could not identify any defects of any kind on the ballots.

67. There was a 15 second cycle from the time the precinct scanner accepted a ballot to the time it was ready for the next ballot. Therefore, the maximum theoretical capacity with the simple 5 race ballot is about 4 ballots per minute if the next ballot is ready to be fed into the scanner as soon as the scanner was ready to take it. In a real-world voting environment, it takes considerably longer because voters move away from the scanner, the next voter must move in and subsequently figure where to insert the ballot. The Dominion precinct scanner that I observed was considerably slower than the ballot scanners I have tested over the last 15 years. This was done with a simple ballot, and we did not test how increase of the number of races or vote targets on the ballot would affect the scanning speed and performance.

68. Though my analysis is preliminary, this test reveals that a significant percentage of filled ovals that would to a human clearly show voter's intent failed to register as a vote on the precinct count scanner.

69. The necessary testing effort has barely begun at the time of this writing, as only limited access to equipment has been made available. I have not had access to the high-volume mail ballot scanner that is expected to process millions of mail ballots in Georgia's upcoming elections. However, initial results suggest that significant revisions must be made in the scanning settings to avoid a

widespread failure to count certain valid votes that are not marked as filled in ovals. Without testing, it is impossible to know, if setting changes alone are sufficient to cure the issue.

Scanned Ballot Tabulation Software Threshold Settings

70. Georgia is employing a Dominion tabulation software tool called "Dual Threshold Technology" for "marginal marks." (See Exhibit M) The intent of the tool is to detect voter marks that could be misinterpreted by the software and flag them for review. While the goal is admirable, the method of achieving this goal is quite flawed.

71. While it is compelling from development cost point of view to use commercial off the shelf COTS scanners and software, it requires additional steps to ensure that the integration of the information flow is flawless. In this case, the software provided by the scanner manufacturer and with settings and configurations have great impact in how the images are created and what information is removed from the images before the election software processes it. In recent years, many defective scanner software packages have been found. These software flaws include 'image enhancement' features which have remained enabled even when the feature has been chosen to be disabled from the scanner software provided by the manufacturer. An example of dangerous feature to keep

enabled is 'Punch Hole Removal', intended to make images of documents removed from notebook binders to look more aesthetically pleasing. The software can and in many cases will misinterpret a voted oval as a punch hole and erase the vote from the image file and to make this worse, the punch holes are expected to be found only in certain places near the edge of the paper, and therefore it will erase only votes from candidates whose targets are in those target zones.

72. Decades ago, when computing and storage capacity were expensive black-and-white image commonly meant 1-bit black-or-white pixel images like used by Dominion system. As computer got faster and storage space cheaper during the last 2-3 decades black-and-white image has become by default meaning 255 shades of gray grayscale images. For the purposes of reliable digitalization of physical documents, grayscale image carries more information from the original document for reliable processing and especially when colored markings are being processed. With today's technology, the difference in processing time and storage prices between grayscale and 1-bit images has become completely meaningless, and the benefits gained in accuracy are undeniable.

73. I am aware that the Georgia Secretary of State's office has stated that Georgia threshold settings are national industry standards for ballot scanners (Exhibit K). This is simply untrue. If, there were an industry standard for that, it

would be part of EAC certification. There is no EAC standard for such threshold settings. As mentioned before, the optimal settings are products of many elements. The type of the scanner used, the scanner settings and configuration, the type of the paper used, the type of the ink printer has used in printing the ballots, color dropout settings, just to name few. Older scanner models, which were optical mark recognitions scanners, used to be calibrated using calibration sheet – similar process is needed to be established for digital imaging scanners used this way as the ballot scanners.

74. Furthermore, the software settings in Exhibit E box 2 show that the software is instructed to ignore all markings in red color ("Color drop-out: Red"), This clearly indicates that the software was expecting the oval to be printed in Red and therefore it will be automatically removed from the calculation. The software does not anticipate printed black ovals as used in Fulton County. Voters have likely not been properly warned that any pen they use which ink contains high concentration of red pigment particles is at risk of not counting, even if to the human eye the ink looks very dark.

75. I listened to the August 10 meeting of the State Board of Elections as they approved a draft rule related to what constitutes a vote, incorporating the following language:

> *Ballot scanners that are used to tabulate optical scan ballots marked by hand shall be set so that:*
>
> *1. Detection of 20% or more fill-in of the target area surrounded by the oval shall be considered a vote for the selection;*
>
> *2. Detection of less than 10% fill-in of the target area surrounded by the oval shall not be considered a vote for that selection;*
>
> *3. Detection of at least 10% but less than 20% fill-in of the target area surrounded by the oval shall flag the ballot for adjudication by a vote review panel as set forth in O.C.G.A. 21-2-483(g). In reviewing any ballot flagged for adjudication, the votes shall be counted if, in the opinion of the vote review panel, the voter has clearly and without question indicated the candidate or candidates and answers to questions for which such voter desires to vote.*

76. The settings discussed in the rule are completely subject to the scanner settings. How the physical marking is translated into the digital image is determined by those values and therefore setting the threshold values without at the same time setting the scanner settings carries no value or meaning. If the ballots will be continuing to be printed with black only, there is no logic in having any drop-out colors.

77. Before the State sets threshold standards for the Dominion system, extensive testing is needed to establish optimal configuration and settings for each step of the process. Also, the scanners are likely to have settings additional configuration and settings which are not visible menus shown in the manual excerpt. All those should be evaluated and tested for all types of scanners approved for use in Georgia, including the precinct scanners

78. As temporary solution, after initial testing, the scanner settings and configuration should be locked and then a low threshold values should be chosen. All drop-out colors should be disabled. This will increase the number of ballots chosen for human review and reduce the number of valid votes not being counted as cast.

Logic and Accuracy Testing

79. Ballot-Marking Device systems inherits the same well-documented systemic security issues embedded in direct-recording electronic (DRE) voting machine design. Such design flaws eventually are causing the demise of DRE voting system across the country as it did in Georgia. In essence the Ballot Marking Device is a general-purpose computer running a general-purpose operating system with touchscreen that is utilized as a platform to run a software, very similar to DRE by displaying a ballot to the voter and recording the voter's intents. The main difference is that instead of recording those internally digitally, it prints out a ballot summary card of voter's choices.

80. Security properties of this approach would be positively different from DREs if the ballot contained only human-readable information and all voters are required to and were capable of verifying their choices from the paper ballot summary. That of course is unrealistic.

81. When voter fails to inspect the paper ballot and significant portion of the information is not in human readable from as a QR barcode, Ballot-Marking Device based voting effectively inherits most of the negative and undesirable security and reliability properties directly from DRE paradigm, and therefore should be subject to the same testing requirements and mitigation strategies as DREs.

82. In response to repeating myriad of issues with DREs, which have been attributed to causes from screen calibration issues to failures in ballot definition configuration distribution, a robust Logic & Accuracy testing regulation have been established. These root causes are present in BMDs and therefore should be evaluated in the same way as DREs have been.

I received the Georgia Secretary of State's manual "Logic and Accuracy Procedures "Version 1.0 January 2020 from Rhonda Martin. Procedure described in section D "Testing the BMD and Printer" is taking significant shortcuts, presumably to cut the labor work required. (Section D is attached as Exhibit L) These shortcuts significantly weaken the security and reliability posture of the system and protections against already known systemic pitfalls, usability predicaments and security inadequacies.

CONCLUSIONS

83. The scanner software and tabulation software settings and configurations being employed to determine which votes to count on hand marked paper ballots are likely causing clearly intentioned votes not to be counted as cast.

84. The method of using 1-bit images and calculated relative darkness values from such pre-reduced information to determine voter marks on ballots is severely outdated and obsolete. It artificially and unnecessarily increases the failure rates to recognize votes on hand-marked paper ballots. As a temporary mitigation, optimal configurations and settings for all steps of the process should be established after robust independent testing to mitigate the design flaw and augment it with human assisted processes, but that will not cure the root cause of the software deficiency which needs to be addressed.

85. The voting system is being deployed, configured and operated in Fulton County in a manner that escalates the security risk to an extreme level and calls into question the accuracy of the election results. The lack of well-defined process and compliance testing should be addressed immediately using independent experts. The use and the supervision of the Dominion personnel operating Fulton County's Dominion Voting System should be evaluated.

86. Voters are not reviewing their BMD printed ballots before scanning and casting them, which causes BMD-generated results to be un-auditable due to the untrustworthy audit trail. Furthermore, because BMDs are inheriting known fundamental architectural deficiencies from DREs, no mitigation and assurance measures can be weakened, including but not limited to Logic and Accuracy Testing procedures.

This 24th day of August 2020.

FULTON COUNTY
993-SC13

OFFICIAL ABSENTEE/PROVISIONAL/EMERGENCY BALLOT

OFFICIAL DEMOCRATIC PARTY PRIMARY AND
NONPARTISAN GENERAL ELECTION RUNOFF BALLOT
OF THE STATE OF GEORGIA
AUGUST 11, 2020

To vote, blacken the Oval (●) next to the candidate of your choice. To vote for a person whose name is not on the ballot, manually WRITE his or her name in the write-in section and blacken the Oval (●) next to the write-in section. If you desire to vote YES or NO for a PROPOSED QUESTION, blacken the corresponding Oval (●). Use only blue or black pen or pencil.

Do not vote for more candidates than the number allowed for each specific office. Do not cross out or erase. If you erase or make other marks on the ballot or tear the ballot, your vote may not count.

If you change your mind or make a mistake, you may return the ballot by writing "Spoiled" across the face of the ballot and return envelope. You may then mail the spoiled ballot back to your county board of registrars, and you will be issued another official absentee ballot. Alternatively, you may surrender the ballot to the poll manager of an early voting site within your county or the precinct to which you are assigned. You will then be permitted to vote a regular ballot.

"I understand that the offer or acceptance of money or any other object of value to vote for any particular candidate, list of candidates, issue, or list of issues included in this election constitutes an act of voter fraud and is a felony under Georgia law." [O.C.G.A. 21-2-284(e) and 21-2-383(e)]

For State Representative In the General Assembly From 65th District
(Vote for One)
- ○ Sharon Beasley-Teague (Incumbent)
- ✗ Mandisha A. Thomas

For District Attorney of the Atlanta Judicial Circuit
(Vote for One)
- ○ Paul Howard (Incumbent)
- ✗ Fani Willis

For Sheriff
(Vote for One)
- ✗ Theodore "Ted" Jackson (Incumbent)
- ○ Patrick "Pat" Labat

NONPARTISAN GENERAL ELECTION RUNOFF

For Judge, Superior Court of the Atlanta Judicial Circuit
(To Succeed Constance C. Russell)
(Vote for One)
- ✗ Melynee Leftridge Harris
- ○ Tamika Hrobowski-Houston

For Member, Fulton County School Board District 4
(Vote for One)
- ✗ Franchesca Warren
- ○ Sandra C. Wright

OFFICIAL ABSENTEE/PROVISIONAL/EMERGENCY BALLOT

OFFICIAL DEMOCRATIC PARTY PRIMARY AND
NONPARTISAN GENERAL ELECTION RUNOFF BALLOT
OF THE STATE OF GEORGIA
AUGUST 11, 2020

To vote, blacken the Oval (●) next to the candidate of your choice. To vote for a person whose name is not on the ballot, manually WRITE his or her name in the write-in section and blacken the Oval (●) next to the write-in section. If you desire to vote YES or NO for a PROPOSED QUESTION, blacken the corresponding Oval (●). Use only blue or black pen or pencil.

Do not vote for more candidates than the number allowed for each specific office. Do not cross out or erase. If you erase or make other marks on the ballot or tear the ballot, your vote may not count.

If you change your mind or make a mistake, you may return the ballot by writing "Spoiled" across the face of the ballot and return envelope. You may then mail the spoiled ballot back to your county board of registrars, and you will be issued another official absentee ballot. Alternatively, you may surrender the ballot to the poll manager of an early voting site within your county or the precinct to which you are assigned. You will then be permitted to vote a regular ballot.

"I understand that the offer or acceptance of money or any other object of value to vote for any particular candidate, list of candidates, issue, or list of issues included in this election constitutes an act of voter fraud and is a felony under Georgia law." [O.C.G.A. 21-2-284(e) and 21-2-383(a)]

For State Representative In the General Assembly From 65th District
(Vote for One)

- [X] Sharon Beasley-Teague (Incumbent)
- [ ] Mandisha A. Thomas

For District Attorney of the Atlanta Judicial Circuit
(Vote for One)

- [ ] Paul Howard (Incumbent)
- [✓] Fani Willis

For Sheriff
(Vote for One)

- [ ] Theodore "Ted" Jackson (Incumbent)
- [S] Patrick "Pat" Labat

NONPARTISAN GENERAL ELECTION RUNOFF

For Judge, Superior Court of the Atlanta Judicial Circuit
(To Succeed Constance C. Russell)
(Vote for One)

- [ ] Melynee Leftridge Harris
- [✓] Tamika Hrobowski-Houston

Outstacked on 2nd pass concluded only Sarah counted in first pass

Again, all Central scanners were set at the industry standard 0-13% is not a mark (the oval is 5%) 14-28% is the ambiguous level to be checked by review panels, 29%+ is a mark. You ar pointing out the inherent issues with HMPBs that we don't see with BMD marked ballots.
8:02 PM · Jun 13, 2020 from Georgia, USA · Twitter for iPhone

EXHIBIT L:

- Create a voter card from Poll Pad for each unique ballot style within the designated Polling Location
  - Recommend labels be placed on card identifying what ballot style will be displayed by BMD once card is inserted
  - BMD removes the activation code from the Voter Card once used, therefore create the card again from Poll Pad after each use by a BMD

D. Testing the BMD and Printer

Use a combination of Poll Worker Card with Ballot Activation Codes for the polling location, and Voter Cards created from a Poll Pad loaded with the LA/Advance Voting dataset to bring up ballots on the BMD

- Produce at least one printed ballot from each BMD assigned to the polling location
- Produce a test deck from the BMDs assigned to the polling location for each unique ballot style within the polling location. The test deck must contain at least one vote for each candidate listed in each race within the unique ballot style
  - **Example**: Ballot from BMD 1 contains a vote for only the first candidate in each race listed on Ballot Style 1, Ballot from BMD 2 contains a vote only for the second candidate in each race on Ballot Style 1, and continue through the line of devices until all candidates in all races within the unique ballot style have received a single vote
  - **If Number of BMDs outnumber the number of vote positions on the unique ballot style**, start the vote pattern over until all BMDs have produced one printed ballot
  - **If Number of unique ballot styles in the polling place is greater than 1,** once the vote pattern is complete for a unique ballot style, proceed to the next BMD in line to start the review of the next unique Ballot Style
  - **All unique ballot styles do not have to be tested on each BMD**
- Review BMD-generated Test Deck and confirm the vote content before placing in the designated Polling Place Scanner

E. Testing the Polling Place Scanner

- Scan the BMD-generated Test Deck into the Polling Place Scanner
- Scan one blank optical scan ballot style(s) associated to the Polling Place to verify the Polling Place Scanner will recognize the ballot style in case of emergency
- Verify Scanner(s) shows a number of Ballot Cast equal to the number of ballots in the BMD-generated test deck plus the scanned blank Optical Scan ballot styles
- Firmly place the Security Key Tab in the Security Key Slot
- Touch Close Polls
- Enter the passcode
- Touch Enter
- Touch Yes
- Touch No for additional tapes (Scanner will automatically produce 3 copies of the closing tape)

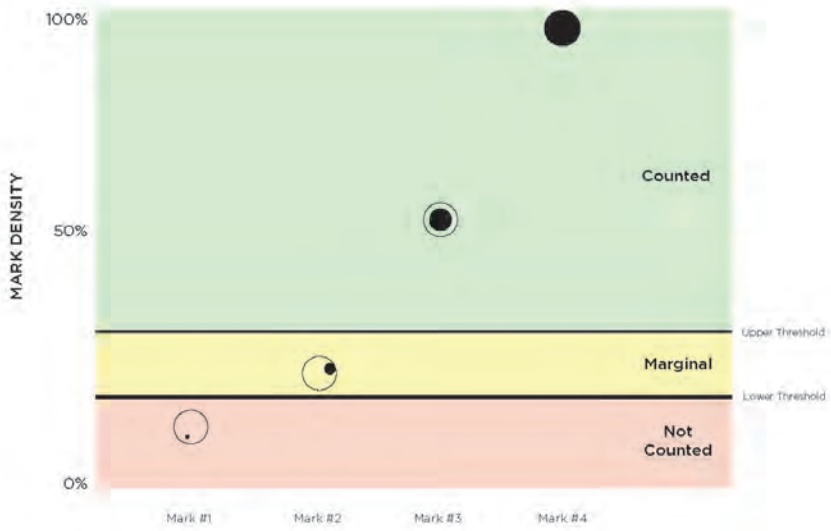
THE DOMINION DIFFERENCE

DUAL THRESHOLD TECHNOLOGY (MARGINAL MARKS)

From its early beginnings, Dominion Voting has emphasized the use of digital scanning, and continues to set the standard in digital image acquisition and analysis in the tabulation of digitally scanned ballots. When a ballot is fed into an ImageCast® tabulator – at the precinct level or centrally - a complete duplex image is created and then analyzed for tabulation by evaluating the pixel count of a voter mark. The pixel count of each mark is compared with two thresholds (which can be defined through the Election Management System) to determine what constitutes a vote. If a mark falls above the upper threshold, it's a valid vote. If a mark falls below the lower threshold, it will not be counted as a vote.

However, if a mark falls between the two thresholds (known as the "ambiguous zone"), it will be deemed as a marginal mark and the ballot will be returned to the voter for corrective action (please see diagram below). With this feature, the voter is given the ability to determine his or her intent, not an inspection or recount board after the fact, when it is too late. The chart below illustrates the Marginal Mark threshold interpretation.



THE DOMINION DIFFERENCE DUAL THRESHOLD TECHNOLOGY DOMINION VOTING

STATEMENT BY ANA MERCEDES DÍAZ CARDOZO

I, Ana Mercedes Díaz Cardozo, hereby declare the following:

1. My name is Ana Mercedes Díaz Cardozo. I'm known as Ana Diaz by many. I am an adult of the sound mine and was born in Caracas, Venezuela on March 24, 1960. I'm a naturalized American citizen. I reside at 923 Gulf Stream Court, Weston, Florida 33327.

2. I make this statement voluntarily and on my own initiative. I have not been promised, nor do I expect to receive anything in exchange for my testimony and give this statement. I have no expectation of any benefit or reward and understand that there are those who can try to hurt me for what I say in this statement.

3. I moved from Venezuela to the United States in 2004 due to political corruption and rapid decline in my home country of Venezuela. I want to alert the public and let the world know the truth about corruption, manipulation, and lies committed through a conspiracy of individuals and businesses with the intention of betraying the honest people of the United States and its legally constituted institutions and fundamental rights as citizens. This conspiracy began more than a decade ago in Venezuela and has spread to countries around the world. It is a conspiracy to unjustly gain and maintain power and wealth. These are political leaders, powerful companies, and others whose purpose is to gain and maintain power by changing people's free will and subverting the proper course of governing.

4. After graduating from high school, I attended the University of Santa Maria in Caracas, Venezuela and graduated as a lawyer in 1987. Then I studied a postgraduate degree in administrative law at the University of Central Venezuela. Before I could submit my thesis for a Master's degree in Administrative Law, I moved to the United States. I'm certified as an arbiter of international trade.

5. I was a career official for 25 years at the Supreme Electoral Council of Venezuela, which is the name that it was called in the 1970's. It is currently called the National Electoral Council. This is the highest electoral administrative agency in Venezuela and oversees all elections in Venezuela. In 1979, at the age of 19, I began my career at the Supreme Electoral Council of Venezuela as secretary in the regional delegation of the federal district. When I graduated from the university as a lawyer, my position on the Supreme Electoral Council changes to the position as an adviser to the Judicial Council of the Supreme Council Electoral. In 1991, I was appointed Assistant Director General of Political Parties, where I served until Hugo Chavez came to power in 1998. Also during this time, I served for seven years as a member of the Legislative Commission of the Venezuelan Electoral Council. It was the role of the Legislative Commission to review and identify any issues related to candidates

for elected positions. The Legislative Commission and my office had access to many resources within the various departments of the Electoral Council, including an information technology section that had experts in computers, computer programming, computer systems and telecommunications features such as modems, telephone lines. I was regularly in communication with the various departments of the Electoral Body for my daily duties. In the last years of my work for the Electoral Counsel, a little of my activities and duties were to learn about electronic voting systems and their functioning by Council experts.

6. As Deputy Director General of Political Parties in the Supreme Electoral Council, it was my duty to oversee everything related to political parties in Venezuela, particularly the participation of political parties in elections and the selection and qualifications of candidates for political office. My office reviewed everything to do with the ability of political parties to participate in the electoral process. Before a political party could be formed, it had to undergo a process for approval. This included legal approval of the party name, its colors and a list of its members. The proposed party had to have a certain percentage of Venezuela's population depending on whether it wanted to be a regional or national party. It could not be constituted as a political party until it was approved by the Supreme Electoral Council. My office also oversaw the creation of ballots that bore the name of the candidates and any party symbol or color that the candidate would like to use. When our office approved these matters, we sent the ballot for printing and circulation. Any conflict over which group could be a political party, which would be a candidate for elected office, how that candidate would be included in the vote, were decided by my office. I was a signatory to all decisions taken by the Political Parties office at the Supreme Electoral Council.

7. After Hugo Chavez was elected, he changed the Venezuelan Constitution. One such change was in the Supreme Electoral Council, now the Electoral Power. In February 2009, a national referendum was passed to change Venezuela's Constitution to end mandate limits for elected officials, including the President of Venezuela. This change allowed Hugo Chavez to be re-elected an unlimited number of times.

8. In 2003, I was appointed Director General of Political Parties at the National Electoral Council. At the end of that year there was a national effort to hold a referendum to remove Hugo Chavez from the post of President. In 2004 I was appointed to the Validation Committee that was responsible for reviewing petitions, the requirements of the signatories were their name, their signature, their fingerprint and their identification number. I discovered many ways that the party in power was trying to override requests. One was the change of forms to reflect that the petition was a referendum on the removal of members of the Venezuelan Congress

rather than the removal of the Venezuelan president. The purpose of manipulating petitions was to prevent a referendum to remove President Chavez from office. I investigated the allegations of fraud with the referendum petitions and lobbied for the fraudulent changes to be rectified. Because of my resistance and protests to this voter fraud, I received a letter in March 2004 stating that my position was trusted and trust had been lost in me and I was fired from the service.

9. After my dismissal, I decided to commit to the study of electoral processes both within Venezuela and in other countries, particularly in South American countries that were experiencing electoral unrest and government manipulation of constitutions, laws and elections. I joined a small group of highly educated and informed people who had access to information about the Venezuelan government and its activities. This group and I conduct interviews with Venezuelan citizens, read news publications and specialized treaties, and write evaluating the political, economic, legal and electoral changes taking place in Venezuela, South American countries, and other parts of the world controlled by socialist dictators and oligarchies. I read these treatises, studies, and publications to educate myself on how elections were manipulated and the use of empirical analysis to detect and identify the manipulation of elections and their results. In addition, I have collected copies of official Venezuelan government documents.

10. Official documents of the Venezuelan government include documents showing the bidding process for the implementation of a new electronic voting system in March 2004 and the award of the contract for that new system to Smartmatic. A true and authentic copy of the venezuelan National Electoral Council's tender documents, internal memorandums and contract signed between the Venezuelan government and the SBC Consortium (Smartmatic) are labeled Exhibit 1 and this statement is attached. I received the documents that constitute Exhibit 1 from a reliable person who had taken some notes on the documents and highlighted some parts for my attention. I have not made any alterations to what I have received, and the substantive content of the documents is authentic. For convenience, I've had the Bates document tagged at the bottom right of each page.

11. I have studied the documents contained in Exhibit 1 and have several observations. Exhibit 1 says that it is a contract between the National Electoral Council and the SBC Consortium (Smartmatic) and is dated 15 March 2004. It has a stamp that says Bolivarian Republic of Venezuela, Secretary General of the National Electoral Council. That is the official seal of the Secretary of the National Electoral Council. The initials at the bottom right side confirm the document's authenticity.

12. You would notice that page DIAZ 00002 is important because it shows that the contract is being made on February 16, 2004. Page DIAZ 00027, reflects that on February 14, 2004 at 11:50 a.m., in the Council's session room, Francisco Carrasquero López, Ezequiel Zamora Presilla, Jorge Rodríguez Gómez (Jorge Rodríguez), Sobella Mejías, and William Pacheco Medina, Vice President, the directors of the Secretary General of Electoral Voters respectively, in order to proceed with the delivery to the technical commissions, designated at the meeting dated 13 February 2004, they opened the tender envelopes containing the tenders of the companies that wanted to be awarded a contract for the automation of Venezuela's voting system and the processes used to carry out the 2004 referendum on the revocation of Hugo Chavez's election. Below you can read the amounts of offers made by Smartmatic SBC, Diebold and other bidders.

13. Then, on page DIAZ 000031, there is an internal note from the Director General of Administration, Mr. Medina. It was dated 14 February 2004 and said that a report on the research and evaluation of companies bidding for the automation of the voting system needed to be prepared.

14. It would then draw attention to the page marked DIAZ 000029. It is a document made on February 13, 2004. While this page is out of sequence, it shows the speed at which the decision was made to award the electoral system contract. The tender began on February 13 and had ended on February 16th -- a three-day period to review contracts and evaluate the specifications and performance of bidders' systems, including software, hardware, security, performance and bidding costs for the procurement, installation, training and operation of the systems. By February 16th, a decision to choose Smartmatic was made. This is convincing evidence that there was no genuine competition for the electoral system contract or serious consideration for alternative contracts. There was no due diligence and the bidding was rigged. It is not possible that within three or four days to do the formal investigation to evaluate the bids and award a contract of this size and important. The impropriety of this action is confirmed by the fact that the contract with Smartmatic was signed a month later, on 15 March 2004.

15. After the contract was awarded to Smartmatic, it was learned that Smartmatic had no previous experience in conducting elections and electoral tabulations. More importantly, it was discovered that the Smartmatic voting system contained two-way communication functions that allowed voting data not only to be sent to a central system of operation and voting, but the central voting system in operation and tabulation to send operational instructions and data to voting machines. It is not mentioned in the contract documents and specifications that the system would be bidirectional and would allow the transmission of data and instructions from the central operating system directly to voting machines. One

simply has to examine the system diagram on page DIAZ 000057 of Exhibit 1. If this feature of the Smartmatic system had been disclosed to the Electoral Council, it could not have adequately accepted Smartmatic's offer because it would allow the Smartmatic voting system to be handled in a way that manipulated votes and interfered with the legitimate voting and electoral process by impersonating the will to govern officials with the will of the electorate: the citizens of Venezuela. It was not surprising that Hugo Chávez and his successors then constantly won the election through the use and manipulation of the Smartmatic voting system.

16. In the 16 years since I left my post as Director General of Political Parties at the National Electoral Council of Venezuela, I have studied the electoral systems of Bolivia, Colombia, Ecuador, Guatemala, Honduras and Nicaragua and have observed elections and participated in pro-democratic forums in Colombia, Ecuador, Honduras and Nicaragua. I have also studied and researched electoral processes in Europe, participating in public academic conferences in Spain and Italy on the subject of democratic electoral processes.

17. Based on my specialized experiences with electoral systems, I have a firm view that no legitimate electronic voting system should be allowed to have the ability of two-way communications to send data and instructions between central tabulation operations and voting machines over telephone lines or the Internet. Having such characteristics compromise the integrity of the entire voting process by allowing injection of data and instructions to manipulate voting before, during and after an election and to avoid detection of processes and mechanisms designed to prevent voting manipulation and fraud.

I declare under penalty of perjury that the above is true and correct and that this Statement was prepared in Dallas County, Texas, and executed on November 20, 2020.

Ana Mercedes Díaz Cardozo

Declaration of Seth Keshel

Pursuant to 28 U.S.C Section 1746, I, Seth Keshel, make the following declaration.

1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. I am a trained data analyst with experience in multiple fields, including service in the United States Army as a Captain of Military Intelligence, with a one-year combat tour in Afghanistan. My experience includes political involvement requiring a knowledge of election trends and voting behavior.
3. I reside at 233 Muir Hill Dr., Aledo, TX 76008.
4. My declaration highlights substantial deviance from statistical norms and results regarding voting patterns in Wisconsin.
5. All 2020-related voting totals are taken from the Decision Desk HQ unofficial tracker, are not certified, and are subject to change from the time of the creation of this declaration.
6. Wisconsin has shown a steady decrease for support in Democratic presidential nominees since Barack Obama won the state by 13.91% in 2008. He won Wisconsin again in 2012, but only by a margin of 6.94%, and Republican Donald Trump won the state by 0.77% in 2016.
7. As part of an overall working-class voter shift, Wisconsin has moved in the same manner as Pennsylvania, Ohio, Michigan, and Minnesota – decreasing levels of support for Democratic nominees, and by consequence of this shift, increasing levels of support for Republican

nominees. This shift is captured in visual form in Exhibit A to this declaration.

8. The following counties have cast more Democratic presidential votes than cast for Obama in 2008, when he won the state by 13.91%:
    a. Ozaukee – 26,515 Biden votes, a 31.5% increase from 2016, and 28.8% more than cast for Obama in 2008. President Trump has increased his vote share by 11.3%, receiving 33,912 votes. Democratic vote shifts were -6.9% in 2012 and +5.3% in 2016.
    b. Dane – 260,157 Biden votes, a 19.5% increase from 2016, and 26.3% more than cast for Obama in 2008. President Trump has increased his vote share by 10.5%, receiving 78,789 votes. Democratic vote shifts were +4.9% in 2012 and +0.8% in 2016. Dane County is home to the University of Wisconsin. President Obama had record support, turnout, and enthusiasm among college-age students and did not have to navigate pandemic-related challenges to turn out these voters, which makes Biden's total extremely suspicious.
    c. Waukesha – 103,867 Biden votes, a 31.1% increase from 2016, and 21.7% more than cast for Obama in 2008. President Trump has increased his vote share by 12.0%, receiving 159,633 votes. Democratic vote shifts were -7.7% in 2012 and +0.6% in 2016.
    d. St. Croix - 23,190 Biden votes, a 32.7% increase from 2016, and 9.5% more than cast for Obama in 2008. President Trump has increased his vote share by 22.8%, receiving 32,190 votes. Democratic vote shifts were -6.0% in 2012 and -12.2% in 2016,

making such a sharp Democratic turnabout in the face of a strong President Trump vote increase extremely suspect.

e. Washington - 26,647 Biden votes, a 27.8% increase from 2016, and 3.6% more than cast for Obama in 2008. President Trump has increased his vote share by 16.4%, receiving 60,235 votes. Democratic vote shifts were -9.9% in 2012 and -10.0% in 2016. A rebound of 27.8% for Democrats from two consecutive cycles of heavy losses, particularly with President Trump reconsolidating the Republican Party base and lost third-party voters, seems unlikely.

f. Bayfield - 6,155 Biden votes, a 24.3% increase from 2016, and 3.1% more than cast for Obama in 2008. President Trump has increased his vote share by 12.0%, receiving 4,617 votes. Democratic vote shifts were +1.0% in 2012 and -18.9% in 2016.

9. Milwaukee County's voter rolls shrank from 2016 to 2020, after losing 13.1% of President Obama's Democratic vote total from 2012; however, this year, Milwaukee County has surged in Democratic votes to nearly equal Obama re-election levels with 317,251 votes, even as President Trump has made an increase of 6.6% in votes. With a declining voter roll, Milwaukee County was likely on track to cast less than 275,000 Democratic ballots this year. Combining these resurgent totals with the transparency issues experienced on the early morning hours of November 4, their current total of 317,251 is strikingly suspect.

10. *New York Times* live vote reporting shows a dump of 168,541 votes at 3:42:20 (a.m.) on November 4, 2020. Of those votes, 143,378

(85.07%) went for Biden, and just 25,163 (14.93%) went for Trump. This dump was enough to flip the race with almost no transparency to the viewing public. The live graph showing this vote dump (circled) is attached as Exhibit D to this document.

11. President Trump has vastly increased his vote share in the entirety of Wisconsin, and also in the rural parts of the state, including the counties he flipped from Democratic to Republican in 2016; however, against the trends of the previous election, the Democrats have increased at greater margins than Trump has, thereby erasing margin gain, and allowing for suspicious vote totals in Milwaukee, Dane, Ozaukee, Waukesha, St. Croix, and other counties with strikingly high Democratic vote totals to overwhelm Trump's totals. A county classification of Wisconsin is available in Exhibit B to this declaration, and a full analysis of Wisconsin's voter irregularities is available in Exhibit C.

Aledo, Texas

Improbable Voting Trend Reversals in Wisconsin

Seth Keshel, MBA

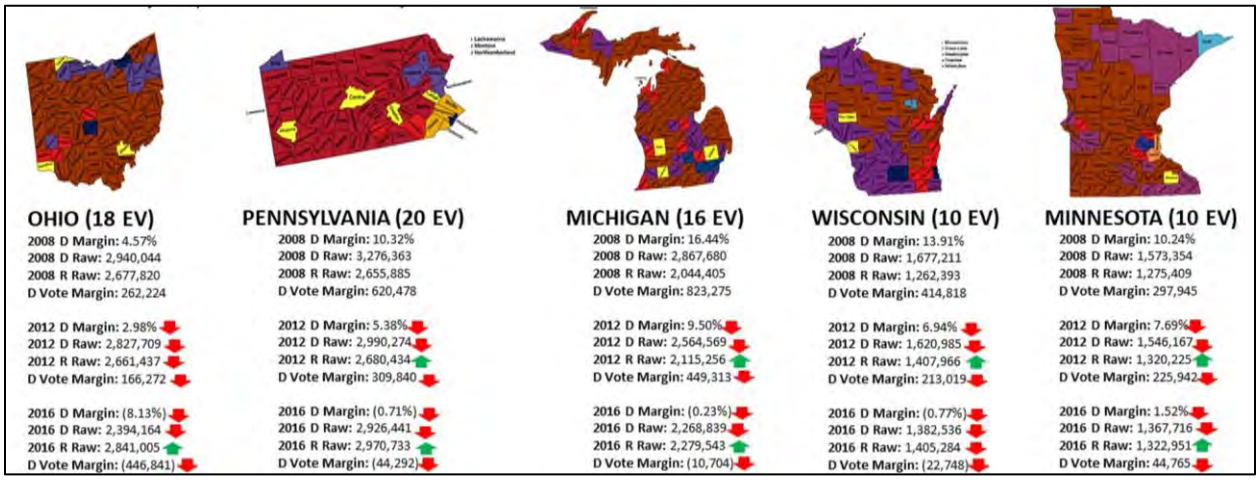
Executive Summary

Wisconsin is showing the same pattern of potential widespread fraud as observed in Pennsylvania, Michigan, Georgia, and North Carolina. While Milwaukee County is focal for transparency and observation violations, including reporting statistically impossible vote counts in the early morning hours away from scrutiny, Dane County has surged far past support totals for President Obama, despite expected difficulties mobilizing student voters to polls. President Trump has reconsolidated the Republican base in suburban Milwaukee and far surpassed his 2016 support levels but has been limited in margin growth by historically improbable Democratic support in these strongholds, which defy years of data in Wisconsin in which the Republican party surged as the Democratic Party plunged. Finally, in strong Trump counties showing a double inversion cycle (one party up, the other down), particularly in rural and exurban Wisconsin, Trump's totals are soaring, and against established trends, Biden's totals are at improbable levels of support despite lacking registration population growth.

The entire vote must be recanvassed and audited for both electronic vote fraud and mail/absentee fraud.

Opening

Since President Obama swept through the Midwest ("Rust Belt") region in 2008, winning Pennsylvania by 10 percent, Michigan by 16 percent, and Wisconsin by 14 percent, the Democratic Party has declined steadily in all successive Presidential elections in not only share of the vote, but in raw votes overall, without exception (pending the final results of the 2020 election). Pennsylvania is the only state mentioned in this paragraph which registers voters by party, and it has trended three percentage points in favor of Republicans since the 2016 election. The raw vote trends and results in these three states, plus Ohio and Minnesota, are pictured below.



These trends show the Democrats losing raw votes in every election since 2008, with the Republicans gaining in eight of 10 samples, and with the margins moving in favor of Republicans each time. This is a product of limited or stagnant population growth in these states, which given stable turnout numbers, means one party is typically going down if another is going up. In fast-growing states such as Florida, Texas, or Arizona, it should be expected for both parties to make substantial gains in a "horse race" scenario.

Wisconsin

President Obama's margin of victory in Wisconsin from 2008 fell from 13.91% to 6.94% in his reelection campaign, and that margin moved 7.71% toward Republicans in 2016 as the working-class communities that historically favored Democrats moved to support then-candidate Donald Trump. Declining voting power from these working class counties beginning and 2012, and then from Milwaukee County in 2016 was an instrumental part of this shift, as was the substantial movement of northern Wisconsin toward the Republican Party. President Trump was able to win Wisconsin in 2016 thanks to substantially decreased support for Democrats, and even overcame less than optimal support from the Republican strongholds of southeastern Wisconsin.

The consistent characteristic in the shift in Wisconsin's political landscape is the declining Democratic Party raw vote totals, and the increasing Republican totals. Thus far, according to the Decision Desk unofficial vote tally, President Trump is substantially adding to his vote totals in every Wisconsin County, while his opponent adds votes at a greater percentage, often in counties that have trended steadily away from Democrats since at least 2008. The following counties, which have mostly lost Democratic votes since 2008, have now contributed more Biden votes than Obama received in 2008, when he won the state by 13.91%. Green font represents growth in raw votes. Red font represents decrease in raw votes.

County	Rep '08	Dem '08	Rep '12	Dem '12	Rep '16	Dem '16	Rep '20	Dem '20	Dem Percentage of Obama 2008 Votes

Findings

The most suspicious counties are those that showed two consecutive elections trending upward for the Republican candidate and downward for the Democratic candidate. These show a similar pattern to counties in Pennsylvania trending heavily Republican in registration, with a significant increase for President Trump in raw votes in 2020, but a smaller than expected margin due to an unexpected sharp reversal of votes for Biden in counties showing inverse trends for parties in recent elections. The only counties not showing two consecutive cycles of decline for Democrats are Waukesha, Bayfield, and Milwaukee. Wisconsin had several Republican counties in 2016 with fewer votes for Trump and higher third-party vote shares (hence 2,682 fewer votes for Trump than Romney), but based on 2020 returns to this point, that has been overcome in every single county.

Dane County is clearly associated with a major university, with student turnout thought to be reaching record lows due to campus shutdowns and lack of mobilization. This county is over 2008 Obama levels by 26.3% (54,173 votes), when that candidate drew record support from young voters, and up 19.5% since 2016, after two consecutive elections of sparse growth in Democrat votes. This county is one of few counties Obama overperformed in for his reelection, and 2020's total is still 20.4% over that number. The same mathematical improbability given the circumstances of 2020 was also seen in Washtenaw County, Michigan (home county of the University of Michigan). Dane County should be audited and recanvassed significantly, particularly for mail and absentee ballot fraud.

Trump slightly underperformed Romney's 2012 vote totals statewide because he lagged in total votes from suburban counties Waukesha, Racine, Washington, Ozaukee, and Walworth. This year, he has reconsolidated the Republican base and improved at a minimum of 11.3% (Ozaukee) in raw votes in these counties, and at a high of 17.3% (Walworth). President Trump has grown his share of raw votes in Wisconsin by a minimum of 4.1% (Menominee) in all counties, and at a high of 24.8% (Kenosha).

Among the largest counties in the state, the largest spikes in growth since 2016 by the Democratic candidate came in St. Croix (32.7%), Ozaukee (31.5%), Waukesha (31.1%), Washington (27.7%), placing them ahead of President Obama's total of votes in those counties in 2008, a year in

which he won the state by 13.91%. This could be feasible if the inverse pattern of "one party up, one party down" were present, suggesting the transfer of voters from one party to the next, but President Trump has also greatly overperformed his 2016 vote totals and does not exhibit the collapse in support seen by Democrats in 2012 and 2016, especially in known Republican strongholds. While it is plausible that Democrats should add votes in those counties based on observed party registration trends in the Philadelphia area, it is unfathomable that those counties would overperform their 2008 Obama vote numbers by such margins, while still adding substantial increases in raw votes to President Trump in 2020.

Despite ranking 67th in the state in percentage increase in voter registrations, Milwaukee County increased its share of Democratic votes by 9.8%, even as President Trump increased by 6.6% while supposedly securing a higher share of minority votes than any Republican since 1960. Biden's total is nearly equal to Obama's 2008 performance and reverses a massive loss of Democratic votes in 2016 in a post-Obama environment, despite a decreasing voter roll (more than 3% decrease in registrations since 2016). Strangely, Milwaukee's turnout dwarfs other regional counterparts like Cleveland, Gary, and Indianapolis. This county is reported to have had many flagrant abuses of transparency regulations and is also known to have reported results without observation in the early morning hours of November 4, 2020, which was just enough to overcome a once formidable lead in the state by President Trump. The best course of action in Milwaukee is to recanvass and audit every mail-in and absentee ballot for massive fraud. The trend in Cleveland, Detroit, Milwaukee, and Philadelphia recently has suggested decreasing vote totals from one election to the next and is supported by the aforementioned significant decrease in the voter rolls in Milwaukee. This year's reported vote totals necessitate and improbable turnout level and suggest illegality in reporting and mail balloting.

All counties showing two consecutive cycles of inverse party trend (Republican up twice, Democrat down twice), with Democrats substantially up this year, may be subject to counting errors, or "glitches," like those reported in Antrim County, Michigan, or even recently in Rock County, Wisconsin. These voting machines and their associated software should be audited and examined by coding professionals, especially if the recent newsworthy events regarding corrupted voting software are widespread. It is highly possible that tampered or corrupted software in known Trump strongholds may be responsible for reducing margins of raw vote victory in counties that have massively left the Democratic Party since 2008.

The entire vote in Wisconsin is suspect against recent trends and should be subject to recanvass and audit, not just a recount of hundreds of thousands of illegal ballots. It appears that the major case in the state is that in spite of substantially growing his vote share in strong-Trump counties, and surging in votes in urban and suburban counties, Trump's margin is substantially limited, even after two consecutive inverse party trends. In urban or suburban areas, Democratic vote share is soaring to record numbers, even over Obama's totals after a 13.91% win, all while Trump surges in votes in those counties as well. Urban areas have issues with transparency and should be fully audited for mail and absentee fraud.

Ballot-Marking Devices (BMDs) Cannot Assure the Will of the Voters

Abstract

The complexity of U.S. elections usually requires computers to count ballots—but computers can be hacked, so election integrity requires a voting system in which paper ballots can be recounted by hand. However, paper ballots provide no assurance unless they accurately record the vote as the voter expresses it.

Voters can express their intent by indelibly hand-marking ballots, or using computers called ballot-marking device (BMDs). Voters can make mistakes in expressing their intent in either technology, but only BMDs are also subject to hacking, bugs, and misconfiguration of the software that prints the marked ballots. Most voters do not review BMD-printed ballots, and those who do often fail to notice when the printed vote is not what they expressed on the touchscreen. Furthermore, there is no action a voter can take to demonstrate to election officials that a BMD altered their expressed votes, nor is there a corrective action that election officials can take if notified by voters—there is no way to deter, contain, or correct computer hacking in BMDs. These are the essential security flaws of BMDs.

Risk-limiting audits can assure that the votes recorded on paper ballots are tabulated correctly, but no audit can assure that the votes on paper are the ones expressed by the voter on a touchscreen: Elections conducted on current BMDs cannot be confirmed by audits. We identify two properties of voting systems, *contestability* and *defensibility*, necessary for audits to confirm election outcomes. No available EAC-certified BMD is contestable or defensible.

[†]Authors are listed alphabetically; they contributed equally to this work.

1 Introduction: Criteria for Voting Systems

Elections for public office and on public questions in the United States or any democracy must produce outcomes based on the votes that voters *express* when they indicate their choices on a paper ballot or on a machine. Computers have become indispensable to conducting elections, but computers are vulnerable. They can be hacked—compromised by insiders or external adversaries who can replace their software with fraudulent software that deliberately miscounts votes—and they can contain design errors and bugs—hardware or software flaws or configuration errors that result in mis-recording or mis-tabulating votes. Hence there must be some way, *independent* of any software in any computers, to ensure that reported election outcomes are correct, i.e., consistent with the expressed votes as intended by the voters.

Voting systems should be *software independent*, meaning that "an undetected change or error in its software cannot cause an undetectable change or error in an election outcome" [29, 30, 31]. Software independence is similar to tamper-evident packaging: if somebody opens the container and disturbs the contents, it will leave a trace.

The use of software-independent voting systems is supposed to ensure that if someone fraudulently hacks the voting machines to steal votes, we'll know about it. But we also want to know *the true outcome* in order to avoid a do-over election.[1] A voting system is *strongly software independent* if it is software independent and, moreover, a detected change or error in an election outcome (due to change or error in the software) can be corrected using only the ballots and ballot records of the current election [29, 30]. Strong software independence combines tamper evidence with a kind of resilience: there's a way to tell whether faulty software caused a problem, and a way to recover from the problem if it did.

Software independence and *strong software independence* are now standard terms in the analysis of voting systems, and it is widely accepted that voting systems should be software independent. Indeed, version 2.0 of the Voluntary Voting System Guidelines (VVSG 2.0) incorporates this principle [10].

But as we will show, these standard definitions are incomplete and inadequate, because in the word *undetectable* they hide several important questions: *Who* detects the change or error in an election outcome? How can a person *prove* that she has detected

[1] Do-overs are expensive; they may delay the inauguration of an elected official; there is no assurance that the same voters will vote in the do-over election as voted in the original; they decrease public trust. And if the do-over election is conducted with the same voting system that can only detect but not correct errors, then there may need to be a do-over of the do-over, *ad infinitum.*

an error? *What happens* when someone detects an error—does the election outcome remain erroneous? Or conversely: How can an election administrator *prove* that the election outcome not been altered, or prove that the correct outcome was recovered if a software malfunction was detected? The standard definition does not distinguish evidence available to an election official, to the public, or just to a single voter; nor does it consider the possibility of false alarms.

Those questions are not merely academic, as we show with an analysis of ballot-marking devices. Even if some *voters* "detect" that the printed output is not what they expressed to the BMD—even if some of *those* voters report their detection to election officials—there is no mechanism by which the *election official* can "detect" whether a BMD has been hacked to alter election outcomes. The questions of *who detects, and then what happens,* are critical—but unanswered by the standard definitions.

We will define the terms *contestable* and *defensible* to better characterize properties of voting systems that make them acceptable for use in public elections.[2]

A voting system is *contestable* if an undetected change or error in its software that causes a change or error in an election outcome can always produce *public* evidence that the outcome is untrustworthy. For instance, if a voter selected candidate A on the touchscreen of a BMD, but the BMD prints candidate B on the paper ballot, then this A-vs-B evidence is available to the individual voter, but the voter cannot demonstrate this evidence to anyone else, since nobody else saw—nor should have seen—where the voter touched the screen.[3] Thus, the voting system does not provide a way for the voter who observed the misbehavior to prove to anyone else that there was a problem, even if the problems altered the reported outcome. Such a system is therefore not *contestable*.

While the definition of software independence might allow evidence available only to individual voters as "detection," such evidence does not suffice for a system to be contestable. Contestibility is software independence, plus the requirement that "detect" implies "can generate public evidence." "Trust me" does not count as public evidence. If a voting system is not contestable, then problems voters "detect" might never see the light of day, much less be addressed or corrected.[4]

[2]There are other notions connected to contestability and defensibility, although essentially different: Benaloh et al. [6] define a *P-resilient canvass framework*, *personally verifiable P-resilient canvass framework*, and *privacy-perserving personally verifiable P-resilient canvass frameworks*.

[3]See footnote 18.

[4]If voters are the only means of detecting and quantifying the effect of those problems—as they are for BMDs—then in practice the system is not strongly software independent. The reason is that, as we will show, such claims by (some) voters *cannot* correct software-dependent changes to other voters' ballots, and *cannot* be used as the basis to invalidate or correct an election outcome. Thus, BMD-based

Similarly, while strong software independence demands that a system be able to report the correct outcome even if there was an error or alteration of the software, it does not require *public evidence* that the (reconstructed) reported outcome is correct. We believe, therefore, that voting systems must also be *defensible*. We say that a voting system is defensible if, when the reported electoral outcome is correct, it is possible to generate convincing public evidence that the reported electoral outcome is correct—despite any malfunctions, software errors, or software alterations that might have occurred. If a voting system is not defensible, then it is vulnerable to "crying wolf": malicious actors could claim that the system malfunctioned when in fact it did not, and election officials will have no way to prove otherwise.

By analogy with *strong software independence*, we define: A voting system is *strongly defensible* if it is defensible and, moreover, a detected change or error in an election outcome (due to change or error in the software) can be corrected (with convincing public evidence) using only the ballots and ballot records of the current election.

In short, a system is contestable if it can generate public evidence of a problem whenever a reported outcome is wrong, while a system is defensible if it can generate public evidence whenever a reported outcome is correct—despite any problems that might have occurred. Contestable systems are publicly tamper-evident; defensible systems are publicly, demonstrably resilient.

Defensibility is a key requirement for *evidence-based elections* [38]: defensibility makes it possible in principle for election officials to generate convincing evidence that the reported winners really won—if the reported winners did really win. (We say an election *system* may be defensible, and an *election* may be evidence-based; there's much more *process* to an election than just the choice of system.)

Examples. The only known practical technology for contestable, strongly defensible voting is a system of *hand-marked paper ballots*, kept demonstrably physically secure, counted by machine, audited manually, and recountable by hand.[5] In a hand-marked paper ballot election, ballot-marking software cannot be the source of an error or change-of-election-outcome, because no software is used in marking ballots. Ballot-scanning-and-counting software can be the source of errors, but such errors can be

election systems are not even (weakly) software independent, unless one takes "detection" to mean "somebody claimed there was a problem, with no evidence to support that claim."

[5]The election must also generate convincing evidence that physical security of the ballots was not compromised, and the audit must generate convincing public evidence that the audit itself was conducted correctly.

detected and corrected by audits.

That system is *contestable:* if an optical scan voting machine reports the wrong outcome because it miscounted (because it was hacked, misprogrammed, or miscalibrated), the evidence is *public*: the paper ballots, recounted before witnesses, will not match the claimed results, also witnessed. It is *strongly defensible:* a recount before witnesses can demonstrate that the reported outcome is correct, or can find the correct outcome if it was wrong—and provide public evidence that the (reconstructed) outcome is correct.

Some other paper-based systems such as Prêt-à-Voter [32] and Scantegrity [9] are also contestable and strongly defensible (provided the marked ballots are kept demonstrably secure through tabulation and posting). Scantegrity inherits these properties from the fact that it amounts to a cryptographic enhancement of hand-marked paper ballots. Prêt-à-Voter has these properties if the blank ballots are audited appropriately before the election.

Paper-based systems that rely on the "Benaloh challenge"—to ensure that the encryption of the vote printed on the ballot (by an electronic device) is correct—generally are neither contestable nor defensible.[6] The reason is that, while the challenge can produce public evidence that a machine did not accurately encrypt the plaintext vote on the ballot, if the machine prints the wrong plaintext vote and a correct encryption of that incorrect vote, there is no evidence the voter can use to prove that to anyone else. STAR-Vote [5] is an example of such a system.

Over 40 states now use some form of paper ballot for most voters [18]. Most of the remaining states are taking steps to adopt paper ballots. But *not all voting systems that use paper ballots are equally secure*.

Some are not even software independent. Some are software independent, but not strongly software independent, contestable, or defensible. In this report we explain:

- *Hand-marked paper ballot* systems are the only practical technology for contestable, strongly defensible voting systems.
- *Some ballot-marking devices (BMDs)* can be software independent, but they not strongly software independent, contestable, or defensible. Hacked or misprogrammed BMDs can alter election outcomes undetectably, so elections conducted using BMDs cannot provide public evidence that reported outcomes are correct. If BMD malfunctions are detected, there is no way to determine who

[6] Nor are they strongly software independent.

really won. Therefore BMDs should not be used by voters who are able to mark an optical-scan ballot with a pen.
- *All-in-one BMD or DRE+VVPAT voting machines* are not software independent, contestable, or defensible. They should not be used in public elections.

2 Background

We briefly review the kinds of election equipment in use, their vulnerability to computer hacking (or programming error), and in what circumstances risk-limiting audits can mitigate that vulnerability.

Voting equipment

Although a voter may form an intention to vote for a candidate or issue days, minutes, or seconds before actually casting a ballot, that intention is a psychological state that cannot be directly observed by anyone else. Others can have access to that intention through what the voter (privately) *expresses* to the voting technology by interacting with it, e.g., by making selections on a BMD or marking a ballot by hand.[7] Voting systems must accurately record the vote as the voter *expressed* it.

With a *hand-marked paper ballot optical-scan* system, the voter is given a paper ballot on which all choices (candidates) in each contest are listed; next to each candidate is a *target* (typically an oval or other shape) which the voter marks with a pen to indicate a vote. Ballots may be either preprinted or printed (unvoted) at the polling place using *ballot on demand* printers. In either case, the voter creates a tamper-evident record of intent by marking the printed paper ballot with a pen.

Such hand-marked paper ballots may be scanned and tabulated at the polling place using a *precinct-count optical scanner* (PCOS), or may be brought to a central place to

[7] We recognize that voters make mistakes in expressing their intentions. For example, they may misunderstand the layout of a ballot or express an unintended choice through a perceptual error, inattention, or lapse of memory. The use of touchscreen technology does not necessarily correct for such user errors, as every smartphone user who has mistyped an important text message knows. Poorly designed ballots, poorly designed touchscreen interfaces, and poorly designed assistive interfaces increase the rate of error in voters' expressions of their votes. For the purposes of this report, we assume that properly engineered systems seek to minimize such usability errors.

be scanned and tabulated by a *central-count optical scanner* (CCOS). Mail-in ballots are typically counted by CCOS machines.

After scanning a ballot, a PCOS machine deposits the ballot in a secure, sealed ballot box for later use in recounts or audits; this is *ballot retention*. Ballots counted by CCOS are also retained for recounts or audits.[8]

Paper ballots can also be hand counted, but in most jurisdictions (especially where there are many contests on the ballot) this is hard to do quickly; Americans expect election-night reporting of unofficial totals. Hand counting—i.e., manually determining votes directly from the paper ballots—is appropriate for audits and recounts.

A *ballot-marking device* (BMD) provides a computerized user interface that presents the ballot to voters and captures their expressed selections—for instance, a touchscreen interface or an assistive interface that enables voters with disabilities to vote independently. Voter inputs (expressed votes) are recorded electronically. When a voter indicates that the ballot is complete and ready to be cast, the BMD prints a paper version of the electronically marked ballot. We use the term *BMD* for devices that mark ballots but do not tabulate or retain them, and *all-in-one* for devices that combine ballot marking, tabulation, and retention into the same paper path.

The paper ballot printed by a BMD may be in the same format as an optical-scan form (e.g., with ovals filled as if by hand) or it may list just the names of the candidate(s) selected in each contest. The BMD may also encode these selections into barcodes or QR codes for optical scanning. We discuss issues with barcodes later in this report.

An *all-in-one touchscreen voting machine* combines computerized ballot marking, tabulation, and retention in the same paper path. All-in-one machines come in several configurations:

- DRE+VVPAT machines—direct-recording electronic (DRE) voting machines with a voter-verifiable paper audit trail (VVPAT)—provide the voter a touchscreen (or other) interface, then print a paper ballot that is displayed to the voter under glass. The voter is expected to review this ballot and approve it, after which the machine deposits it into a ballot box. DRE+VVPAT machines do not contain optical scanners; that is, they do not read what is marked on the paper ballot; instead, they tabulate the vote directly from inputs to the touchscreen or other interface.

[8] Regulations and procedures governing custody and physical security of ballots are uneven and in many cases inadequate, but straightforward to correct because of decades of development of best practices.

- BMD+Scanner all-in-one machines[9] provide the voter a touchscreen (or other) interface to input ballot choices and print a paper ballot that is ejected from a slot for the voter to inspect. The voter then reinserts the ballot into the slot, after which the all-in-one BMD+scanner scans it and deposits it into a ballot box. Or, some BMD+Scanner all-in-one machines display the paper ballot behind plexiglass for the voter to inspect, before mechanically depositing it into a ballot box.

Opscan+BMD with separate paper paths. At least one model of voting machine (the Dominion ICP320) contains an optical scanner (opscan) and a BMD in the same cabinet,[10] so that the optical scanner and BMD-printer are not in the same paper path; no possible configuration of the software could cause a BMD-marked ballot to be deposited in the ballot box without human handling of the ballot. We do not classify this as an *all-in-one* machine.

Hacking

There are many forms of computer hacking. In this analysis of voting machines we focus on the alteration of voting machine software so that it miscounts votes or mismarks ballots to alter election outcomes. There are many ways to alter the software of a voting machine: a person with physical access to the computer can open it and directly access the memory; one can plug in a special USB thumbdrive that exploits bugs and vulnerabilities in the computer's USB drivers; one can connect to its WiFi port or Bluetooth port or telephone modem (if any) and exploit bugs in those drivers, or in the operating system.

"Air-gapping" a system (i.e., never connecting it to the Internet nor to any other network) does not automatically protect it. Before each election, election administrators must transfer a *ballot definition* into the voting machine by inserting a *ballot definition cartridge* that was programmed on election-administration computers that may have been connected previously to various networks; it has been demonstrated that vote-changing viruses can propagate via these ballot-definition cartridges [17].

Hackers might be corrupt insiders with access to a voting-machine warehouse; corrupt insiders with access to a county's election-administration computers; outsiders who can gain remote access to election-administration computers; outsiders who can

[9] Some voting machines, such as the ES&S ExpressVote, can be configured as either a BMD or a BMD+Scanner all-in-one. Others, such as the ExpressVoteXL, work only as all-in-one machines.

[10] More precisely, the ICP320 optical scanner and the BMD audio+buttons interface are in the same cabinet, but the printer is a separate box.

gain remote access to voting-machine manufacturers' computers (and "hack" the firmware installed in new machines, or the firmware updates supplied for existing machines), and so on. Supply-chain hacks are also possible: the hardware installed by a voting system vendor may have malware pre-installed by the vendor's component suppliers.[11]

Computer systems (including voting machines) have so many layers of software that it is impossible to make them perfectly secure [23, pp. 89–91]. When manufacturers of voting machines use the best known security practices, adversaries may find it more difficult to hack a BMD or optical scanner—but not impossible. Every computer in every critical system is vulnerable to compromise through hacking, insider attacks or exploiting design flaws.

Election assurance through risk-limiting audits

To ensure that the reported electoral outcome of each contest corresponds to what the voters expressed, the most practical known technology is a *risk-limiting audit* (RLA) of trustworthy paper ballots [34, 35, 22]. The National Academies of Science, Engineering, and Medicine, recommend routine RLAs after every election [23], as do many other organizations and entities concerned with election integrity.[12]

The *risk limit* of a risk-limiting audit is the maximum chance that the audit will not correct the reported electoral outcome, if the reported outcome is wrong. "Electoral outcome" means the political result—who or what won—not the exact tally. "Wrong" means that the outcome does not correspond to what the voters expressed.

A RLA involves manually inspecting randomly selected paper ballots following a rigorous protocol. The audit stops if and when the sample provides convincing evidence that the reported outcome is correct; otherwise, the audit continues until every ballot has been inspected manually, which reveals the correct electoral outcome if the paper trail is trustworthy. RLAs protect against vote-tabulation errors, whether those errors are caused by failures to follow procedures, misconfiguration, miscalibration, faulty

[11] Given that many chips and other components are manufactured in China and elsewhere, this is a serious concern. Carsten Schürmann has found Chinese pop songs on the internal memory of voting machines (C. Schürmann, personal communication, 2018). Presumably those files were left there accidentally—but this shows that malicious code *could* have been pre-installed deliberately, and that neither the vendor's nor the election official's security and quality control measures discovered and removed the extraneous files.

[12] Among them are the Presidential Commission on Election Administration, the American Statistical Association, the League of Women Voters, and Verified Voting Foundation.

engineering, bugs, or malicious hacking.[13]

The risk limit should be determined as a matter of policy or law. For instance, a 5% risk limit means that, if a reported outcome is wrong solely because of tabulation errors, there is at least a 95% chance that the audit procedure will correct it. Smaller risk limits give higher confidence in election outcomes, but require inspecting more ballots, other things being equal. RLAs never revise a correct outcome.

RLAs can be very efficient, depending in part on how the voting system is designed and how jurisdictions organize their ballots. If the computer results are accurate, an efficient RLA with a risk limit of 5% requires examining just a few—about 7 divided by the margin—ballots selected randomly from the contest.[14] For instance, if the margin of victory is 10% and the results are correct, the RLA would need to examine about $7/10\% = 70$ ballots to confirm the outcome at 5% risk. For a 1% margin, the RLA would need to examine about $7/1\% = 700$ ballots. The sample size does not depend much on the total number of ballots cast in the contest, only on the margin of the winning candidate's victory.

RLAs assume that a full hand tally of the paper trail would reveal the correct electoral outcomes: the paper trail must be trustworthy. Other kinds of audits, such as *compliance audits* [6, 22, 38, 36] are required to establish whether the paper trail itself is trustworthy. Applying an RLA procedure to an untrustworthy paper trail cannot limit the risk that a wrong reported outcome goes uncorrected.

Properly preserved hand-marked paper ballots ensure that expressed votes are identical to recorded votes. But BMDs might not record expressed votes accurately, for instance, if BMD software has bugs, was misconfigured, or was hacked: BMD printout is not a trustworthy record of the expressed votes. Neither a compliance audit nor a RLA can possibly check whether errors in recording expressed votes altered election outcomes. RLAs that rely on BMD output therefore cannot limit the risk that an incorrect reported election outcome will go uncorrected.

A paper-based voting system (such as one that uses optical scanners) is systematically more secure than a paperless system (such as DREs) *only if the paper trail is trustworthy and the results are checked against the paper trail using a rigorous method such as an RLA or full manual tally*. If it is possible that error, hacking, bugs, or mis-

[13] RLAs do not protect against problems that cause BMDs to print something other than what was shown to the voter on the screen, nor do they protect against problems with ballot custody.

[14] Technically, it is the *diluted margin* that enters the calculation. The diluted margin is the number of votes that separate the winner with the fewest votes from the loser with the most votes, divided by the number of ballots cast, including undervotes and invalid votes.

calibration caused the recorded-on-paper votes to differ from the expressed votes, an RLA or even a full hand recount cannot not provide convincing public evidence that election outcomes are correct: such a system cannot be *defensible*. In short, paper ballots provide little assurance against hacking if they are never examined or if the paper might not accurately reflect the votes expressed by the voters.

3 (Non)Contestability/Defensibility of BMDs

A BMD-generated paper trail is not a reliable record of the vote expressed by the voter. Like any computer, a BMD (or a DRE+VVPAT) is vulnerable to bugs, misconfiguration, hacking, installation of unauthorized (fraudulent) software, and alteration of installed software.

If a hacker sought to steal an election by altering BMD software, what would the hacker program the BMD to do? In cybersecurity practice, we call this the *threat model*.

The simplest threat model is this one: In some contests, not necessarily top-of-the-ticket, change a small percentage of the votes (such as 5%).

In recent national elections, analysts have considered a candidate who received 60% of the vote to have won by a landslide. Many contests are decided by less than a 10% margin. Changing 5% of the votes can change the margin by 10%, because "flipping" a vote for one candidate into a vote for a different candidate changes the difference in their tallies—i.e., the margin—by 2 votes. If hacking or bugs or misconfiguration could change 5% of the votes, that would be a very significant threat.

Although public and media interest often focus on top-of-the-ticket races such as President and Governor, elections for lower offices such as state representatives, who control legislative agendas and redistricting, and county officials, who manage elections and assess taxes, are just as important in our democracy. Altering the outcome of smaller contests requires altering fewer votes, so fewer voters are in a position to notice that their ballots were misprinted. And most voters are not as familiar with the names of the candidates for those offices, so they might be unlikely to notice if their ballots were misprinted, even if they checked.

Research in a real polling place in Tennessee during the 2018 election, found that half the voters *didn't look at all* at the paper ballot printed by a BMD, even when they were holding it in their hand and directed to do so while carrying it from the BMD to the optical scanner [13]. Those voters who did look at the BMD-printed ballot

spent *an average of 4 seconds* examining it to verify that the eighteen or more choices they made were correctly recorded. That amounts to 222 milliseconds per contest, barely enough time for the human eye to move and refocus under perfect conditions and not nearly enough time for perception, comprehension, and recall [27]. A study by other researchers [7], in a simulated polling place using real BMDs deliberately hacked to alter one vote on each paper ballot, found that only 6.6% of voters told a pollworker something was wrong.[15][16] The same study found that among voters who examined their hand-marked ballots, half were unable to recall key features of ballots cast moments before, a prerequisite step for being able to recall their own ballot choices. This finding is broadly consistent with studies of effects like "change blindness" or "choice blindness," in which human subjects fail to notice changes made to choices made only seconds before [19].

Suppose, then, that 10% of voters examine their paper ballots carefully enough to even *see* the candidate's name recorded as their vote for legislator or county commissioner. Of those, perhaps only half will remember the name of the candidate they intended to vote for.[17]

Of those who notice that the vote printed is not the candidate they intended to vote for, what will they think, and what will they do? Will they think, "Oh, I must have made a mistake on the touchscreen," or will they think, "Hey, the machine is cheating or malfunctioning!" There's no way for the voter to know for sure—voters do make mistakes—and there's *absolutely* no way for the voter to prove to a pollworker or election official that a BMD printed something other than what the voter entered on the

[15] You might think, "the voter really *should* carefully review their BMD-printed ballot." But because the scientific evidence shows that voters *do not* [13] and cognitively *cannot* [16] perform this task well, legislators and election administrators should provide a voting system that counts the votes *as voters express them*.

[16] Studies of voter confidence about their ability to verify their ballots are not relevant: in typical situations, subjective confidence and objective accuracy are at best weakly correlated. The relationship between confidence and accuracy has been studied in contexts ranging from eyewitness accuracy [8, 12, 40] to confidence in psychological clinical assessments [14] and social predictions [15]. The disconnect is particularly severe at high confidence. Indeed, this is known as "the overconfidence effect." For a lay discussion, see *Thinking, Fast and Slow* by Nobel economist Daniel Kahnemann [20].

[17] We ask the reader, "do you know the name of the most recent losing candidate for county commissioner?" We recognize that some readers of this document *are* county commissioners, so we ask those readers to imagine the frame of mind of their constituents.

screen.[18][19]

Either way, polling-place procedures generally advise voters to ask a pollworker for a new ballot if theirs does not show what they intended. Pollworkers should void that BMD-printed ballot, and the voter should get another chance to mark a ballot. Anecdotal evidence suggests that many voters are too timid to ask, or don't know that they have the right to ask, or are not sure whom to ask. Even if a voter asks for a new ballot, training for pollworkers is uneven, and we are aware of no formal procedure for resolving disputes if a request for a new ballot is refused. Moreover, there is no sensible protocol for ensuring that BMDs that misbehave are investigated—nor can there be, as we argue below.

Let's summarize. If a machine alters votes on 5% of the ballots (enabling it to change the margin by 10%), and 10% of voters check their ballots carefully and 50% of the voters who check notice the error, then optimistically we might expect $5\% \times 10\% \times 50\%$ or 0.25% of the voters to request a new ballot and correct their vote.[20] This means that the machine will change the margin by 9.75% and get away with it.

In this scenario, 0.25% of the voters, one in every 400 voters, has requested a new ballot. You might think, "that's a form of *detection* of the hacking." But is isn't, as a practical matter: a few individual voters may have detected that there was a problem, but there's no procedure by which this translates into any action that election administrators can take to correct the outcome of the election. Polling-place procedures *cannot correct or deter hacking, or even reliably detect it*, as we discuss next. This is essentially the distinction between a system that is merely software independent and one that is contestable: a change to the software that alters the outcome might generate evidence for an alert, conscientious, individual voter, but it does not generate public evidence that an election official can rely on to conclude there is a problem.

Even if some voters notice that BMDs are altering votes, there's no way to correct the election outcome. That is, BMD voting systems are *not contestable*, *not defen-*

[18] You might think, "the voter can prove it by showing someone that the vote on the paper doesn't match the vote onscreen." But that won't work. On a typical BMD, by the time a paper record is printed and ejected for the voter to hold and examine, the touchscreen no longer shows the voter's choice. You might think, "BMDs should be designed so that the choices still show on the screen for the voter to compare with the paper." But a hacked BMD could easily alter the on-screen choices to match the paper, *after* the voter hits the "print" button.

[19] Voters should *certainly not* videorecord themselves voting! That would defeat the privacy of the secret ballot and is illegal in most jurisdictions.

[20] This calculation assumes that the 10% of voters who check are in effect a random sample of voters: voters' propensity to check BMD printout is not associated with their political preferences.

sible (and therefore *not strongly defensible*), and *not strongly software independent*. Suppose a state election official wanted to detect whether the BMDs are cheating, and correct election results, based on actions by those few alert voters who notice the error. What procedures could possibly work against the manipulation we are considering?

1. How about, "If at least 1 in 400 voters claims that the machine misrepresented their vote, void the entire election."[21] No responsible authority would implement such a procedure. A few dishonest voters could collaborate to invalidate entire elections simply by falsely claiming that BMDs changed their votes.
2. How about, "If at least 1 in 400 voters claims that the machine misrepresented their vote, then investigate." Investigations are fine, but then what? The only way an investigation can ensure that the outcome accurately reflects what voters expressed to the BMDs is to void an election in which the BMDs have altered votes and conduct a new election. But how do you know whether the BMDs have altered votes, except based the claims of the voters?[22] Furthermore, the investigation itself would suffer from the same problem as above: how can one distinguish between voters who detected BMD hacking or bugs from voters who just want to interfere with an election?

This is the essential security flaw of BMDs: few voters will notice and promptly report discrepancies between what they saw on the screen and what is on the BMD printout, and even when they do notice, there's nothing appropriate that can be done. Even if election officials are convinced that BMDs malfunctioned, *there is no way to determine who really won*.

Therefore, BMDs should not be used by most voters.

Why can't we rely on pre-election and post-election logic and accuracy testing, or parallel testing? Most, if not all, jurisdictions perform some kind of *logic and accuracy testing* (LAT) of voting equipment before elections. LAT generally involves voting on the equipment using various combinations of selections, then checking whether the

[21] Note that in many jurisdictions, far fewer than 400 voters use a given machine on election day: BMDs are typically expected to serve fewer than 300 voters per day. (The vendor ES&S recommended 27,000 BMDs to serve Georgia's 7 million voters, amounting to 260 voters per BMD [33].) Recall also that the rate 1 in 400 is tied to the amount of manipulation. What if the malware flipped only one vote in 50, instead of 1 vote in 20? That could still change the margin by 4%, but—in this hypothetical—would be noticed by only one voter in 1,000, rather than one in 400. The smaller the margin, the less manipulation it would have taken to alter the electoral outcome.

[22] Forensic examination of the BMD might show that it *was* hacked or misconfigured, but it cannot prove that the BMD *was not* hacked or misconfigured.

equipment tabulated the votes correctly. As the Volkswagen/Audi "Dieselgate" scandal shows, devices can be programmed to behave properly when they are tested but misbehave in use [11]. Therefore, LAT can never prove that voting machines performed properly in practice.

Parallel or "live" testing involves pollworkers or election officials using some BMDs at random times on election day to mark (but not cast) ballots with test patterns, then check whether the marks match the patterns. The idea is that the testing is not subject to the "Dieselgate" problem, because the machines cannot "know" they are being tested on election day.[23] As a practical matter, the number of tests required to provide a reasonable chance of detecting outcome-changing errors is prohibitive: it would leave no time for actual voting [37]. Moreover, it would require additional staff, infrastructure, and other resources.

Suppose, counterfactually, that it was practical to perform enough parallel testing to guarantee a large chance of detecting a problem if BMD hacking or malfunction altered electoral outcomes. Suppose, counterfactually, that election officials were required to conduct that amount of parallel testing during every election, and that the required equipment, staffing, infrastructure, and other resources were provided. Even then, the system would not be *strongly defensible*; that is, if testing detected a problem, there would be no way to to determine who really won. The only remedy would be a new election.

Don't voters need to check hand-marked ballots, too? It is always a good idea to check one's work, but there is a substantial body of research (e.g., [28]) suggesting that preventing error as a ballot is being marked is a fundamentally different cognitive task than detecting an error on a previously marked ballot. In cognitively similar tasks, such as proof reading for non-spelling errors, ten percent rates of error detection are common [28, pp 167ff], whereas by carefully attending to the task of correctly marking their ballots, voters apparently can largely avoid marking errors.

A fundamental difference between hand-marked paper ballots and ballot-marking devices is that, with hand-marked paper ballots, voters are responsible for catching and

[23] BMDs do "know" their own settings and other aspects of each voting session, so malware can use that information to target sessions that use the audio interface, increase the font size, use the sip-and-puff interface, set the language to something other than English, or take much longer than average to vote. (Voters who use those settings might be less likely to be believed if they report that the equipment altered their votes.) For parallel testing to have a good chance of detecting all outcome-changing problems, the tests must have a large chance of probing *every* combination of settings and voting patterns that includes enough ballots to change any contest result. It is not practical.

correcting *their own errors*, while if BMDs are used, voters are also responsible for catching *machine errors, bugs, and hacking*. Voters are the *only* people who can detect such problems with BMDs—but, as explained above, if voters do find problems, there's no way they can prove to poll workers or election officials that there were problems and no way to ensure that election officials take appropriate remedial action.

4 Other tradeoffs, BMDs versus hand-marked opscan

Supporters of ballot-marking devices advance several other arguments for their use.

- **Mark legibility.** A common argument is that a properly functioning BMD will generate clean, error-free, unambiguous marks, while hand-marked paper ballots may contain mistakes and stray marks that make it impossible to discern a voter's intent. However appealing this argument seems at first blush, the data are not nearly so compelling. Experience with statewide recounts in Minnesota and elsewhere suggest that truly ambiguous handmade marks are very rare.[24] For instance, 2.9 million hand-marked ballots were cast in the 2008 Minnesota race between Al Franken and Norm Coleman for the U.S. Senate. In a manual recount, between 99.95% and 99.99% of ballots were unambiguously marked.[25] [26] In addition, usability studies of hand-marked bubble ballots—the kind in most common use in U.S. elections—indicate a *voter* error rate of 0.6%, much lower than the 2.5–3.7% error rate for machine-marked ballots [16].[27] Moreover, modern image-based opscan equipment (*digital scan* machinery) is better than older

[24] States do need clear and complete regulations for interpreting voter marks.

[25] "During the recount, the Coleman and Franken campaigns initially challenged a total of 6,655 ballot-interpretation decisions made by the human recounters. The State Canvassing Board asked the campaigns to voluntarily withdraw all but their most serious challenges, and in the end approximately 1,325 challenges remained. That is, approximately 5 ballots in 10,000 were ambiguous enough that one side or the other felt like arguing about it. The State Canvassing Board, in the end, classified all but 248 of these ballots as votes for one candidate or another. That is, approximately 1 ballot in 10,000 was ambiguous enough that the bipartisan recount board could not determine an intent to vote." [1] See also [25]

[26] We have found that some local election officials consider marks to be ambiguous if *machines* cannot read the marks. That is a different issue from *humans* being unable to interpret the marks. Errors in machine interpretation of voter intent can be dealt with by manual audits: if the reported outcome is wrong because machines misinterpreted handmade marks, a RLA has a known, large chance of correcting the outcome.

[27] Better designed user interfaces (UI) might reduce the error rate for machine-marked ballots below the historical rate for DREs; however, UI improvements cannot keep BMDs from printing something other than what the voter is shown on the screen.

"marksense" machines at interpreting imperfect marks. Thus, mark legibility is not a good reason to adopt BMDs for all voters.

- **Undervotes, overvotes.** Another argument offered for BMDs is that the machines can alert voters to undervotes and prevent overvotes. That is true, but modern PCOS systems can also alert a voter to overvotes and undervotes, allowing a voter to eject the ballot and correct it.
- **Bad ballot design.** Ill-designed paper ballots, just like ill-designed touchscreen interfaces, may lead to unintentional undervotes [24]. For instance, the 2006 Sarasota, Florida, touchscreen ballot was badly designed. The 2018 Broward County, Florida, opscan ballot was badly designed: it violated three separate guidelines from the EAC's 2007 publication, "Effective Designs for the Administration of Federal Elections, Section 3: Optical scan ballots." [39] In both of these cases (touchscreens in 2006, hand-marked optical-scan in 2018), undervote rates were high. The solution is to follow standard, published ballot-design guidelines and other best practices, both for touchscreens and for hand-marked ballots [3, 24].
- **Low-tech paper-ballot fraud.** All paper ballots, however they are marked, are vulnerable to *loss*, *ballot-box stuffing*, *alteration*, and *substitution* between the time they are cast and the time they are recounted. That's why it is so important to make sure that ballot boxes are always in multiple-person (preferably bipartisan) custody whenever they are handled, and that appropriate physical security measures are in place. Strong, verifiable chain-of-custody protections are essential.

  Hand-marked paper ballots are vulnerable to alteration by anyone with a pen. Both hand-marked and BMD-marked paper ballots are vulnerable to substitution: anyone who has poorly supervised access to a legitimate BMD during election day can create fraudulent ballots, not necessarily to deposit them in the ballot box immediately (in case the ballot box is well supervised on election day) but with the hope of substituting it later in the chain of custody.[28]

  All those attacks (on hand-marked and on BMD-marked paper ballots) are fairly low-tech. There are also higher-tech ways of producing ballots indistinguishable from BMD-marked ballots for substitution into the ballot box if there is inadequate chain-of-custody protection.
- **Accessible voting technology.** When hand-marked paper ballots are used with PCOS, there is (as required by law) also an accessible voting technology available in the polling place for voters unable to mark a paper ballot with a pen. This

[28] Some BMDs print a barcode indicating when and where the ballot was produced, but that does not prevent such a substitution attack against currently EAC-certified, commercially available BMDs. We understand that systems under development might make ballot-substitution attacks against BMDs more difficult.

is typically a BMD or a DRE. When the accessible voting technology is not the same as what most voters vote on—when it is used by very few voters—it may happen that the accessible technology is ill-maintained or even (in some polling places) not even properly set up by pollworkers. This is a real problem. One proposed solution is to require all voters to use the same BMD or all-in-one technology. But the failure of some election officials to properly maintain their accessible equipment is not a good reason to adopt BMDs for *all* voters. Among other things, it would expose all voters to the security flaws described above.[29] Other advocates object to the idea that disabled voters must use a different method of marking ballots, arguing that their rights are thereby violated. Both HAVA and ADA require reasonable accommodations for voters with physical and cognitive impairments, but neither law requires that those accommodations must be used by all voters. To best enable and facilitate participation by all voters, each voter should be provided with a means of casting a vote best suited to their abilities.

- **Ballot printing costs.** Preprinted optical-scan ballots cost 20–50 cents each.[30] Blank cards for BMDs cost up to 15 cents each, depending on the make and model of BMD.[31] But optical-scan ballots must be preprinted for as many voters as *might* show up, whereas blank BMD cards are consumed in proportion to how many voters *do* show up. The Open Source Election Technology Institute (OSET) conducted an independent study of total life cycle costs[32] for hand-marked paper ballots and BMDs in conjunction with the 2019 Georgia legislative debate regarding BMDs [26]. OSET concluded that, even in the most optimistic (i.e., lowest cost) scenario for BMDs and the most pessimistic (i.e, highest cost) scenario for hand-marked paper ballots and ballot-on-demand (BOD) printers—which can print unmarked ballots as needed—the total lifecycle costs for BMDs would be higher than the corresponding costs for hand-marked paper ballots.[33]
- **Vote centers.** To run a vote center that serves many election districts with different ballot styles, one must be able to provide each voter a ballot containing

[29] Also, some accessibility advocates argue that requiring disabled voters to use BMDs compromises their privacy since hand-marked ballots are easily distinguishable from machine marked ballots. That issue can be addressed without BMDs-for-all: Accessible BMDs are already available and in use that mark ballots with marks that cannot easily be distinguished from hand-marked ballots.

[30] Single-sheet (one- or two-side) ballots cost 20-28 cents; double-sheet ballots needed for elections with many contests cost up to 50 cents.

[31] Ballot cards for ES&S ExpressVote cost about 15 cents. New Hampshire's (One4All / Prime III) BMDs used by sight-impaired voters use plain paper that is less expensive.

[32] They include not only the cost of acquiring and implementing systems but also the ongoing licensing, logistics, and operating (purchasing paper stock, printing, and inventory management) costs.

[33] BOD printers currently on the market arguably are best suited for vote centers, but less expensive options suited for polling places could be developed. Indeed, BMDs that print full-face ballots could be re-purposed as BOD printers for polling place use, with modest changes to the programming.

the contests that voter is eligible to vote in, possibly in a number of different languages. This is easy with BMDs, which can be programmed with all the appropriate ballot definitions. With preprinted optical-scan ballots, the PCOS can be programmed to *accept* many different ballot styles, but the vote center must still maintain *inventory* of many different ballots. BOD printers are another economical alternative for vote centers.[34]

- **Paper/storage.** BMDs that print summary cards rather than full-face ballots can save paper and storage space. However, many BMDs print full-face ballots—so they do not save storage—while many BMDs that print summary cards (which could save storage) use thermal printers and paper that is fragile and can fade in a few months.[35]

Advocates of hand-marked paper ballot systems advance these additional arguments.

- **Cost.** Using BMDs for all voters substantially increases the cost of acquiring, configuring, and maintaining the voting system. One PCOS can serve 1200 voters in a day, while one BMD can serve only about 260 [33]—though both these numbers vary greatly depending on the length of the ballot and the length of the day. OSET analyzed the relative costs of acquiring BMDs for Georgia's nearly seven million registered voters versus a system of hand-marked paper ballots, scanners, and BOD printers [26]. A BMD solution for Georgia would cost taxpayers between 3 and 5 times more than a system based on hand-marked paper ballots. Open-source systems might eventually shift the economics, but current commercial universal-use BMD systems are more expensive than systems that use hand-marked paper ballots for most voters.
- **Mechanical reliability and capacity.** Pens are likely to have less downtime than BMDs. It is easy and inexpensive to get more pens and privacy screens when additional capacity is needed. If a precinct-count scanner goes down, people can still mark ballots with a pen; if the BMD goes down, voting stops. Thermal

[34] Ballot-on-demand printers *may* require maintenance such as replacement of toner cartridges. This is readily accomplished at a vote center with a professional staff. Ballot-on-demand printers may be a less attractive option for many small precincts on election day, where there is no professional staff—but on the other hand, they are less necessary, since far fewer ballot styles will be needed in any one precinct.

[35] The California Top-To-Bottom Review (TTBR) of voting systems found that thermal paper can also be covertly spoiled wholesale using common household chemicals https://votingsystems.cdn.sos.ca.gov/oversight/ttbr/red-diebold.pdf, last visited 8 April 2019. The fact that thermal paper printing can fade or deteriorate rapidly might mean it does not satisfy the federal requirement to preserve voting materials for 22 months. http://uscode.house.gov/view.xhtml?req=granuleid:USC-prelim-title52-section20701&num=0&edition=prelim, last visited 8 April 2019.

printers used in DREs with VVPAT are prone to jams; those in BMDs might have similar flaws.

These secondary pros and cons of BMDs do not outweigh the primary security and accuracy concern: BMDs, if hacked or erroneously programmed, can change votes in a way that is not correctable. BMD voting systems are not contestable or defensible. Audits that rely on BMD printout cannot make up for this defect in the paper trail: they cannot reliably detect or correct problems that altered election outcomes.

Barcodes

A controversial feature of some BMDs allows them to print 1-dimensional or 2-dimensional barcodes on the paper ballots. A 1-dimensional barcode resembles the pattern of vertical lines used to identify products by their universal product codes. A 2-dimensional barcode or QR code is a rectangular area covered in coded image *modules* that encode more complex patterns and information. BMDs print barcodes on the same paper ballot that contains human-readable ballot choices. Voters using BMDs are expected to verify the human-readable printing on the paper ballot card, but the presence of barcodes with human-readable text poses some significant problems.

- **Barcodes are not human readable.** The whole purpose of a paper ballot is to be able to recount (or audit) the *voters'* votes in a way independent of any (possibly hacked or buggy) computers. If the official vote on the ballot card is the barcode, then it is impossible for the voters to verify that the official vote they cast is the vote they expressed. Therefore, before a state even *considers* using BMDs that print barcodes (and we do not recommend doing so), the State must ensure by statute that recounts and audits are based *only* on the human-readable portion of the paper ballot. Even so, audits based on untrustworthy paper trails suffer from the verifiability the problems outlined above.
- **Ballot cards with barcodes contain two different votes.** Suppose a state does ensure by statute that recounts and audits are based on the human-readable portion of the paper ballot. Now a BMD-marked ballot card with both barcodes and human-readable text contains two different votes in each contest: the barcode (used for electronic tabulation), and the human-readable selection printout (official for audits and recounts). In few (if any) states has there even been a discussion of the legal issues raised when the official markings to be counted differ between the original count and a recount.
- **Barcodes pose technical risks.** Any coded input into a computer system—including wired network packets, WiFi, USB thumbdrives, *and barcodes*—pose

the risk that the input-processing software can be vulnerable to attack via deliberately ill-formed input. Over the past two decades, many such vulnerabilities have been documented on *each* of these channels (including barcode readers) that, in the worst case, give the attacker complete control of a system.[36] If an attacker were able to compromise a BMD, the barcodes are an attack vector for the attacker to take over an optical scanner (PCOS or CCOS), too. Since it is good practice to close down all such unneeded attack vectors into PCOS or CCOS voting machines (e.g., don't connect your PCOS to the Internet!), it is also good practice to avoid unnecessary attack channels such as barcodes.

End-to-End Verifiable BMDs

In all BMD systems currently on the market, and in all BMD systems certified by the EAC, the printed ballot or ballot summary is the only channel by which voters can verify the correct recording of their ballots, independently of the computers. The analysis in this paper applies to all of those BMD systems.

There is a class of voting systems called "end-to-end verifiable" (E2E-V), which provide an alternate mechanism for voters to verify their votes [2]. Some E2E-V systems incorporate BMDs, for instance STAR-Vote[37] [5]. As we discuss above in Section 1, such systems are not contestable, defensible, or strongly software independent. In any event, no E2E-V system is currently certified by the EAC, nor to our knowledge is any such system under review for certification, nor are any of the 5 major voting-machine vendors offering such a system for sale.[38]

[36] An example of a barcode attack is based on the fact that many commercial barcode-scanner components (which system integrators use to build cash registers or voting machines) treat the barcode scanner using the same operating-system interface as if it were a keyboard device; and then some operating systems allow "keyboard escapes" or "keyboard function keys" to perform unexpected operations.

[37] The STAR-Vote system is actually a DRE+VVPAT system with a smart ballot box, rather than a BMD system: voters interact with a device that captures their votes electronically and prints a paper record that voters can inspect, but the electronic votes are held "in limbo" until the paper ballot is deposited in the smart ballot box. The ballot box does not read the votes from the ballot; rather, depositing the ballot tells the system that it has permission to cast the vote that it had already recorded from the touchscreen.

[38] Some vendors, notably Scytl, have sold systems advertised as E2E-V in other countries. Those systems were not in fact E2E-V. Moreover, serious security flaws have been found in their implementations. See, e.g., [21].

5 Insecurity of All-in-One BMDs

Some voting machines incorporate a BMD interface, printer, and optical scanner into the same cabinet. Other DRE+VVPAT voting machines incorporate ballot-marking, tabulation, and paper-printout retention, but without scanning. These are often called "all-in-one" voting machines. To use an all-in-one machine, the voter makes choices on a touchscreen or through a different accessible interface. When the selections are complete, the BMD prints the completed ballot for the voter to review and verify, before depositing the ballot in a ballot box attached to the machine.

Such machines are especially unsafe: like any BMD described in Section 3 they are not contestable or defensible, but in addition, if hacked they can print votes onto the ballot *after* the voter last inspects the ballot.

- The ES&S ExpressVote (in all-in-one mode) allows the voter to mark a ballot by touchscreen or audio interface, then prints a paper ballot card and ejects it from a slot. The voter has the opportunity to review the ballot, then the voter redeposits the ballot into the same slot, where it is scanned and deposited into a ballot box.
- The ES&S ExpressVoteXL allows the voter to mark a ballot by touchscreen or audio interface, then prints a paper ballot and displays it under glass. The voter has the opportunity to review the ballot, then the voter touches the screen to indicate "OK," and the machine pulls paper ballot up (still under glass) and into the integrated ballot box.
- The Dominion ImageCast Evolution (ICE) allows the voter to deposit a hand-marked paper ballot, which it scans and drops into the attached ballot box. *Or*, a voter can use a touchscreen or audio interface to direct the marking of a paper ballot, which the voting machine ejects through a slot for review; then the voter redeposits the ballot into the slot, where it is scanned and dropped into the ballot box.

In all three of these machines, the ballot-marking printer is in the same paper path as the mechanism to deposit marked ballots into an attached ballot box. This opens up a very serious security vulnerability: the voting machine can mark the paper ballot (to add votes or spoil already-cast votes) after the last time the voter sees the paper, and then deposit that marked ballot into the ballot box without the possibility of detection.

Vote-stealing software could easily be constructed that looks for *undervotes* on the ballot, and marks those unvoted spaces for the candidate of the hacker's choice. This is very straightforward to do on optical-scan bubble ballots (as on the Dominion ICE) where undervotes are indicated by no mark at all. On machines such as the ExpressVote

and ExpressVoteXL, the normal software indicates an undervote with the words NO SELECTION MADE on the ballot summary card. Hacked software could simply leave a blank space there (most voters wouldn't notice the difference), and then fill in that space and add a matching bar code after the voter has clicked "cast this ballot."

An even worse feature of the ES&S ExpressVote and the Dominion ICE is the *auto-cast* configuration setting (in the manufacturer's standard software) that allows the voter to indicate, "don't eject the ballot for my review, just print it and cast it without me looking at it." If fraudulent software were installed in the ExpressVote, it could change *all* the votes of any voter who selected this option, because the voting machine software would know *in advance of printing* that the voter had waived the opportunity to inspect the printed ballot. We call this auto-cast feature "permission to cheat" [4].

Regarding these all-in-one machines, we conclude:

- Any machine with ballot printing in the same paper path with ballot deposit is not *software independent*; it is *not* the case that "an error or fault in the voting system software or hardware cannot cause an undetectable change in election results." Therefore such all-in-one machines do not comply with the VVSG 2.0 (the Election Assistance Commission's Voluntary Voting Systems Guidelines). Such machines are not contestable or defensible, either.
- All-in-one machines on which all voters use the BMD interface to mark their ballots (such as the ExpressVote and ExpressVoteXL) *also* suffer from the same serious problem as ordinary BMDs: most voters do not review their ballots effectively, and elections on these machines are not contestable or defensible.
- The auto-cast option for a voter to allow the paper ballot to be cast without human inspection is particularly dangerous, and states must insist that vendors disable or eliminate this mode from the software. However, even disabling the auto-cast feature does not eliminate the risk of undetected vote manipulation.

Remark. The Dominion ImageCast Precinct ICP320 is a precinct-count optical scanner (PCOS) that also contains an audio+buttons ballot-marking interface for disabled voters. This machine can be configured to cast electronic-only ballots from the BMD interface, or an external printer can be attached to print paper optical-scan ballots from the BMD interface. When the external printer is used, that printer's paper path is *not* connected to the scanner+ballot-box paper path (a person must take the ballot from the printer and deposit it into the scanner slot). Therefore this machine is as safe to use as any PCOS with a separate external BMD.

6 Conclusion

Ballot-Marking Devices produce ballots that do not necessarily record the vote expressed by the voter when they enter their selections on the touchscreen: hacking, bugs, and configuration errors can cause the BMDs to print votes that differ from what the voter entered and verified electronically. Because outcome-changing errors in BMD printout do not produce public evidence, BMD systems are not *contestable*. Because there is no way to generate convincing public evidence that reported outcomes are correct despite any BMD malfunctions that might have occurred, BMD systems are not *defensible*. Therefore, BMDs should not be used by voters who can hand mark paper ballots.

All-in-one voting machines, which combine ballot-marking and ballot-box-deposit into the same paper path, are even worse. They have all the disadvantages of BMDs (they are not contestable or defensible), and they can mark the ballot after the voter has inspected it. Therefore they are not even *software independent*, and should not be used by those voters who are capable of marking, handling, and visually inspecting a paper ballot.

When computers are used to record votes, the original transaction (the voter's expression of the votes) is not documented in a verifiable way.[39] When pen-and-paper is used to record the vote, the original expression of the vote *is* documented in a verifiable way (if demonstrably secure chain of custody of the paper ballots is maintained). Audits of elections conducted with hand-marked paper ballots, counted by optical scanners, can ensure that reported election outcomes are correct. Audits of elections conducted with BMDs *cannot* ensure that reported outcomes are correct.

Ruth R. Hughs
Secretary of State

REPORT OF REVIEW OF DOMINION VOTING SYSTEMS DEMOCRACY SUITE 5.5-A

PRELIMINARY STATEMENT

On October 2-3, 2019, Dominion Voting Systems ("Dominion" or the "Vendor") presented the Democracy Suite 5.5-A system for examination and certification. The examination was conducted in Austin, Texas. Pursuant to Sections 122.035(a) and (b) of the Texas Election Code, the Secretary of State appointed the following examiners:

1. Mr. Tom Watson, an expert in electronic data communication systems;
2. Mr. Brian Mechler, an expert in electronic data communication systems;
3. Mr. Brandon Hurley, an expert in election law and procedure; and
4. Mr. Charles Pinney, an expert in election law and procedure.

Pursuant to Section 122.035(a), the Texas Attorney General appointed the following examiners:

1. Dr. Jim Sneeringer, an expert in electronic data communication systems; and
2. Mr. Ryan Vassar, an employee of the Texas Attorney General.

On October 2, 2019, Mr. Pinney, Mr. Mechler, and Dr. Sneeringer witnessed the installation of the Democracy Suite 5.5-A software and firmware that the Office of the Texas Secretary of State (the "Office") received directly from the Independent Testing Authority. The next day, Mr. Pinney examined the accessibility components of the ImageCast X Ballot Marking Device.

On October 3, 2019, the Vendor demonstrated the Democracy Suite 5.5-A system and answered questions presented by the examiners. Test ballots were then processed on each voting device. The results were accumulated and later verified for accuracy by staff of the Secretary of State.

Examiner reports regarding the Democracy Suite 5.5-A system are attached hereto and incorporated herein by this reference.

BRIEF DESCRIPTION OF DEMOCRACY SUITE 5.5-A

The Democracy Suite 5.5-A system is an updated version of the Democracy Suite 5.5 system, which was denied certification by the Office on June 20, 2019. The Democracy Suite 5.5-A system includes certain software and hardware updates to the Suite 5.5 version.

Democracy Suite 5.5-A has been evaluated at an accredited independent voting system laboratory for conformance to the 2005 Voluntary Voting System Guidelines (VVSG). Democracy Suite 5.5-A was certified by the Election Assistance Commission (EAC) on January 30, 2019.

The components of Democracy Suite 5.5-A are as follows:

Component	Version	Description
EMS – Election Management System	5.5.12.1	Election Management System
ADJ – Adjudication	5.5.8.1	
ICC – ImageCast Central	5.5.3.0002	Central scanner
ICX – ImageCast X BMD	5.5.10.30	Ballot marking device
ICP – ImageCast Precinct	5.5.3-0002	Precinct scanner

FINDINGS

The following are the findings, based on written evidence submitted by the Vendor in support of its application for certification, oral evidence presented at the examination, and the findings of the voting system examiners as set out in their written reports.

The examiner reports identified multiple hardware and software issues that preclude the Office of the Texas Secretary of State from determining that the Democracy Suite 5.5-A system satisfies each of the voting-system requirements set forth in the Texas Election Code. Specifically, the examiner reports raise concerns about whether the Democracy Suite 5.5-A system is suitable for its intended purpose; operates efficiently and accurately; and is safe from fraudulent or unauthorized manipulation. Therefore, the Democracy Suite 5.5-A system and corresponding hardware devices do not meet the standards for certification prescribed by Section 122.001 of the Texas Election Code.

CONCLUSION

Accordingly, based upon the foregoing, I hereby deny certification of Dominion Voting Systems' Democracy Suite 5.5-A system for use in Texas elections.

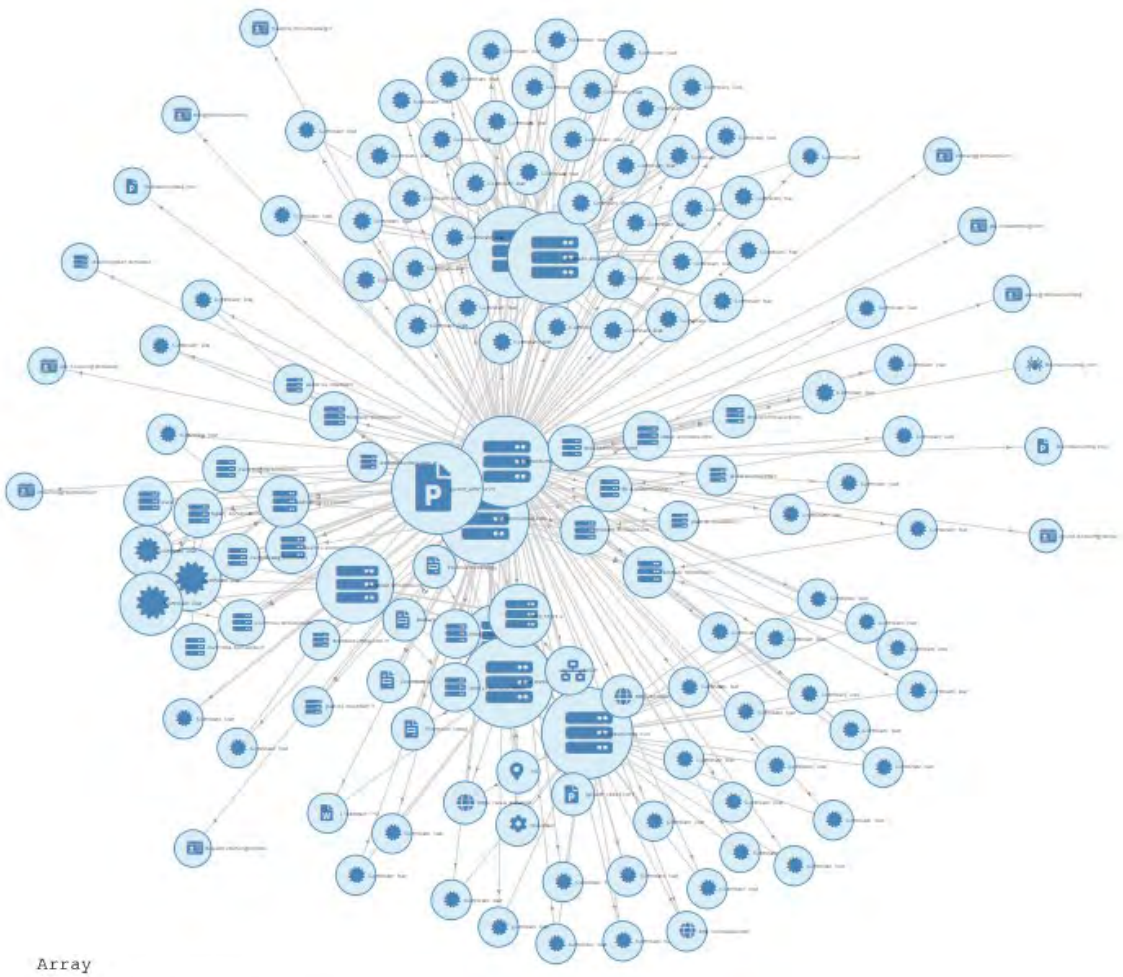
Signed under my hand and seal of office, this 24th day of January 2020.

JOSE A. ESPARZA
DEPUTY SECRETARY OF STATE

Declaration of [redacted]

Pursuant to 28 U.S.C Section 1746, [redacted] make the following declaration.

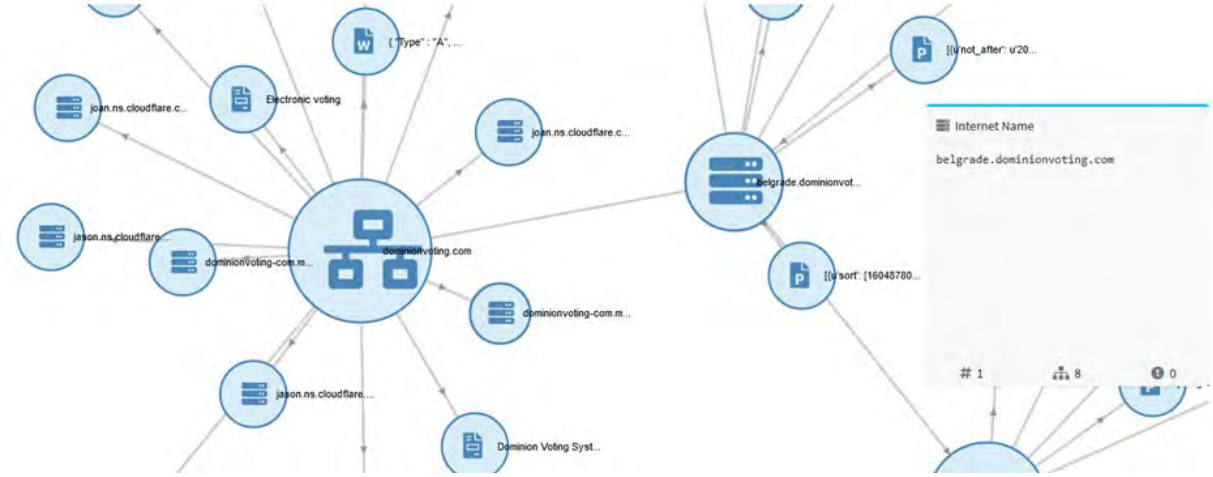
1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. I was an electronic intelligence analyst under 305th Military Intelligence with experience gathering SAM missile system electronic intelligence. I have extensive experience as a white hat hacker used by some of the top election specialists in the world. The methodologies I have employed represent industry standard cyber operation toolkits for digital forensics and OSINT, which are commonly used to certify connections between servers, network nodes and other digital properties and probe to network system vulnerabilities.
3. I am a US citizen and I reside [redacted] location in the United States of America.
4. Whereas the Dominion and Edison Research systems exist in the internet of things, and whereas this makes the network connections between the Dominion, Edison Research and related network nodes available for scanning,
5. And whereas Edison Research's primary job is to report the tabulation of the count of the ballot information as received from the tabulation software, to provide to Decision HQ for election results,
6. And whereas Spiderfoot and Robtex are industry standard digital forensic tools for evaluation network security and infrastructure, these tools were used to conduct public security scans of the aforementioned Dominion and Edison Research systems,
7. A public network scan of Dominionvoting.com on 2020-11-08 revealed the following inter-relationships and revealed 13 unencrypted passwords for dominion employees, and 75 hashed passwords available in TOR nodes:

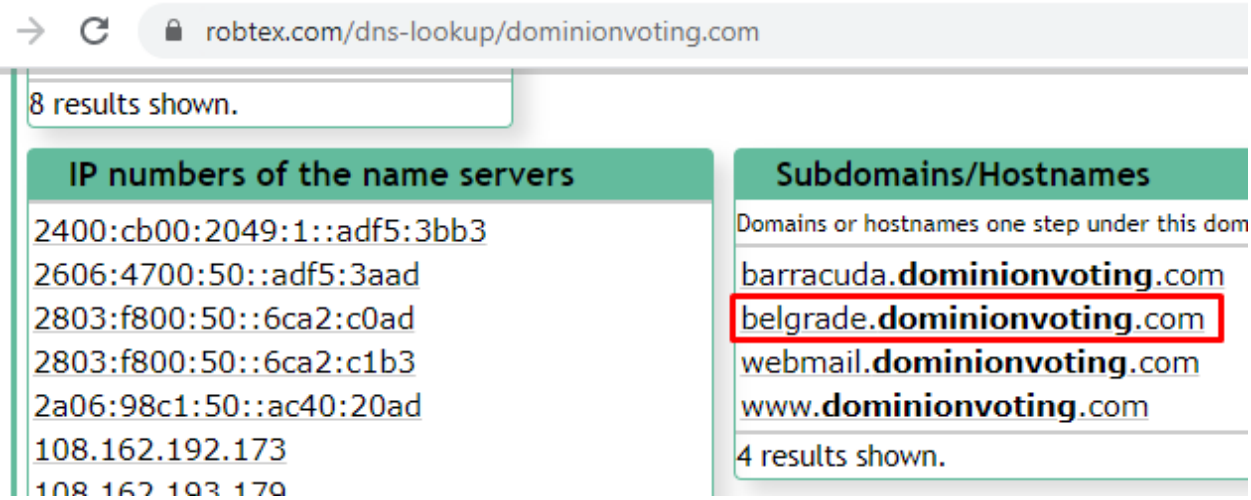


```
Array
(
    [id] => 544167324
    [luser] => ian.macvicar
    [domain] => dominionvoting.com
    [password] => jamley
)

7
Array
(
    [id] => 599400504
    [luser] => jelena.tanaskovic
    [domain] => dominionvoting.com
```

8. The same public scan also showed a direct connection to the group in Belgrade as highlighted below:





9. A cursory search on LinkedIn of "dominion voting" on 11/19/2020 confirms the numerous employees in Serbia:

10. An additional search of Edison Research on 2020-11-08 showed that Edison Research has an Iranian server seen here:

Inputting the Iranian IP into Robtex confirms the direct connection into the "edisonresearch" host from the perspective of the Iranian domain also. This means that it is not possible that the connection was a unidirectional reference.

A deeper search of the ownership of Edison Research "edisonresearch.com" shows a connection to BMA Capital Management, where shareofear.com and bmacapital.com are both connected to edisonresearch.com via a VPS or Virtual Private Server, as denoted by the "vps" at the start of the internet name:

Dominionvoting is also dominionvotingsystems.com, of which there are also many more examples, including access of the network from China. The records of China accessing the server are reliable.

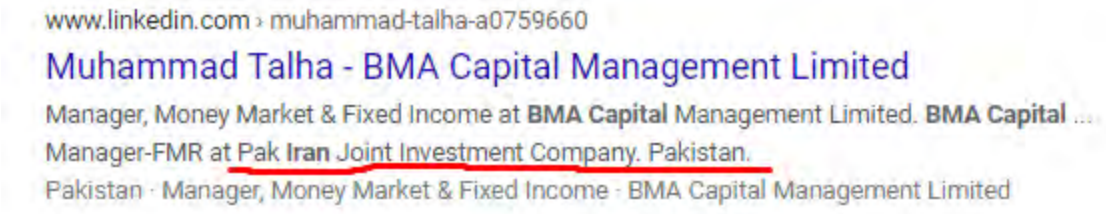
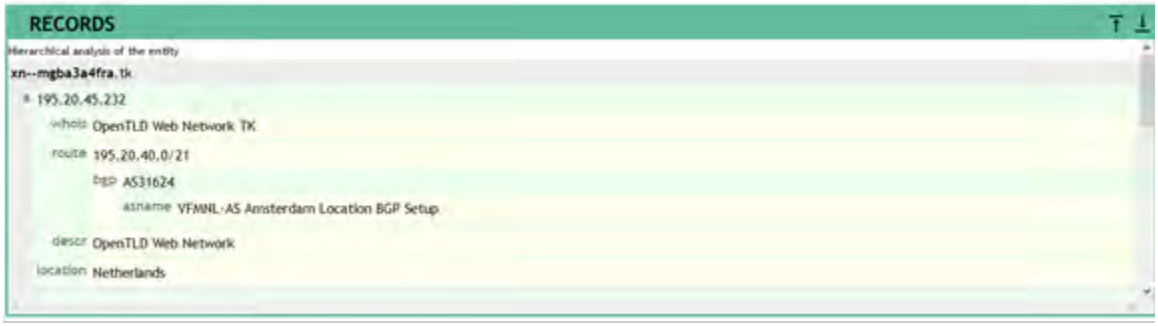
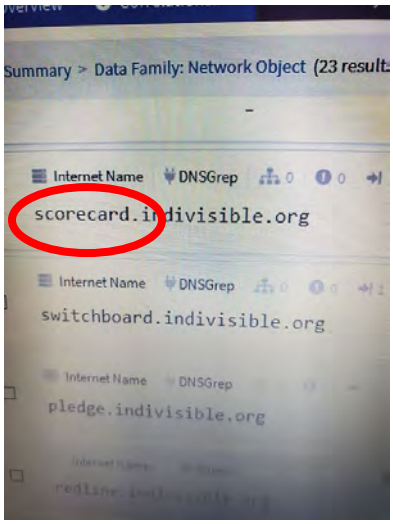
11. BMA Capital Management is known as a company that provides Iran access to capital markets with direct links publicly discoverable on LinkedIn (found via google on 11/19/2020):



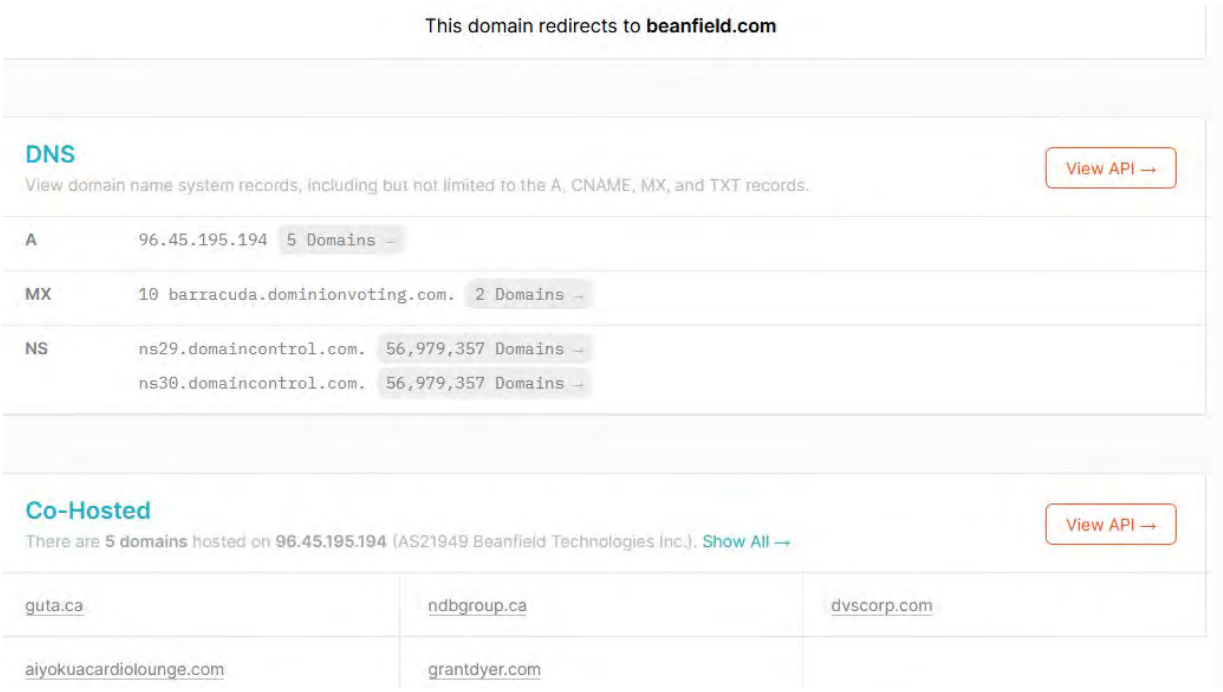
The same Robtex search confirms the Iranian address is tied to the server in the Netherlands, which correlates to known OSINT of Iranian use of the Netherlands as a remote server (See Advanced Persistent Threats: APT33 and APT34):



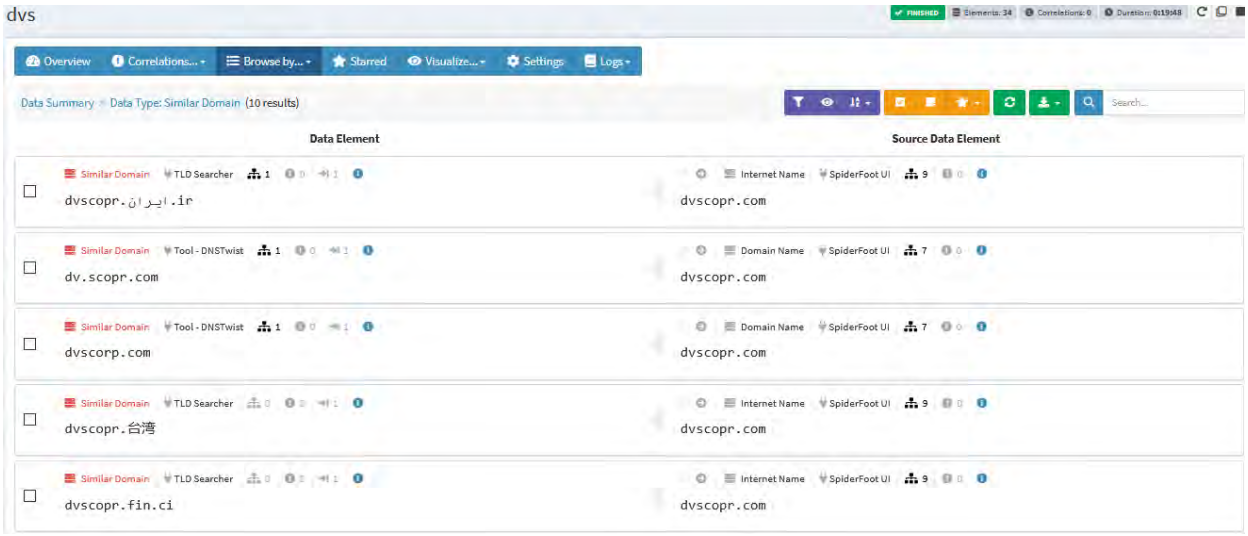
12. A search of the indivisible.org network showed a subdomain which evidences the existence of scorecard software in use as part of the Indivisible (formerly ACORN) political group for Obama:

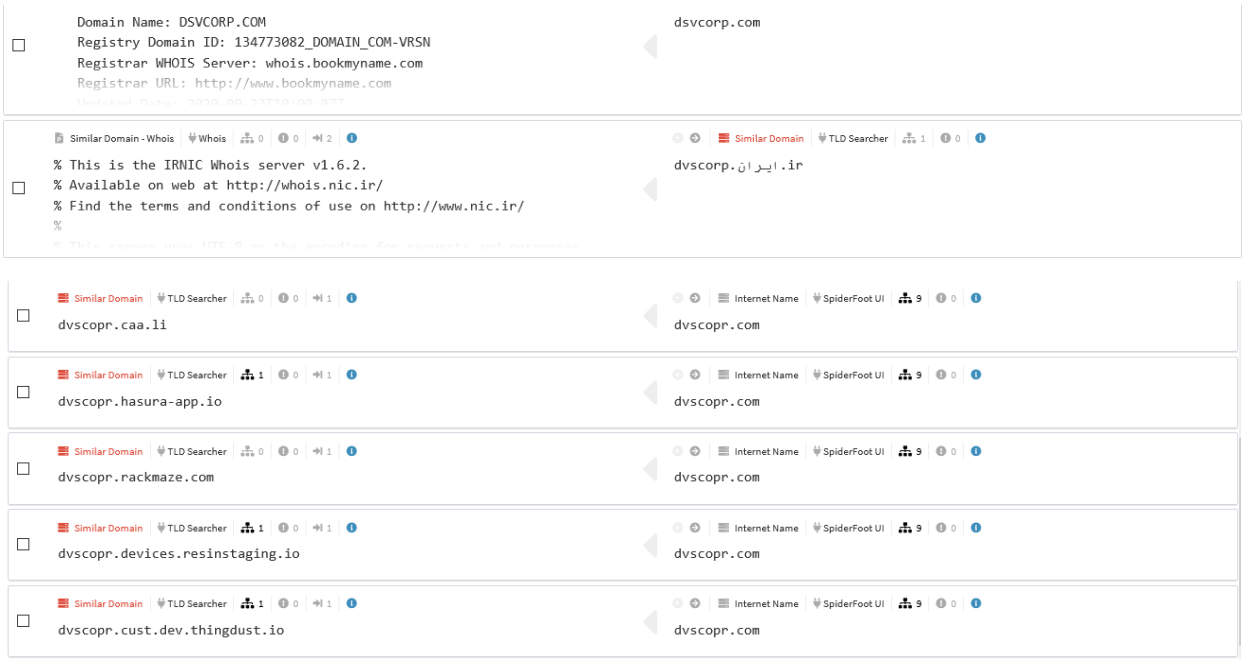


13. Each of the tabulation software companies have their own central reporting "affiliate". Edison Research is the affiliate for Dominion.
14. Beanfield.com out of Canada shows the connections via co-hosting related sites, including dvscorp.com:



This Dominion partner domain “dvscorp” also includes an auto discovery feature, where new in-network devices automatically connect to the system. The following diagram shows some of the related dvscopr.com mappings, which mimic the infrastructure for Dominion and are an obvious typo derivation of the name. Typo derivations are commonly purchased to catch redirect traffic and sometimes are used as honeypots. The diagram shows that infrastructure spans multiple different servers as a methodology.





The above diagram shows how these domains also show the connection to Iran and other places, including the following Chinese domain, highlighted below:

15. The auto discovery feature allows programmers to access any system while it is connected to the internet once it's a part of the constellation of devices (see original Spiderfoot graph).
16. Dominion Voting Systems Corporation in 2019 sold a number of their patents to China (via HSBC Bank in Canada):

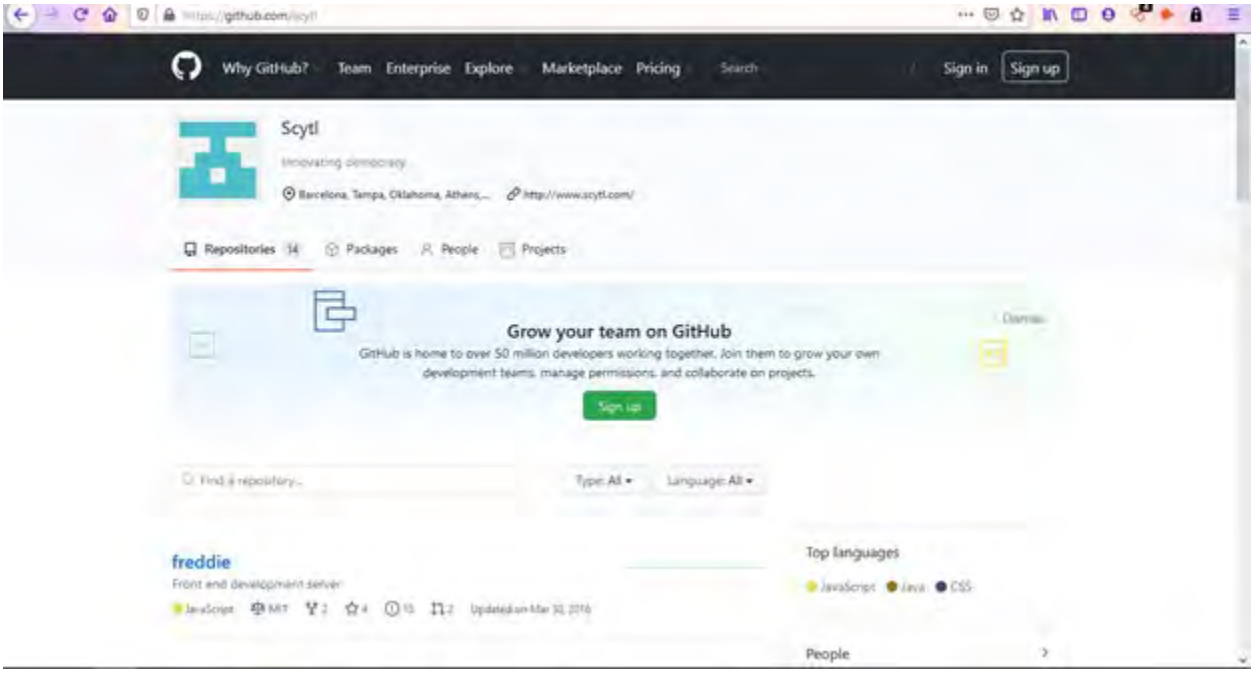
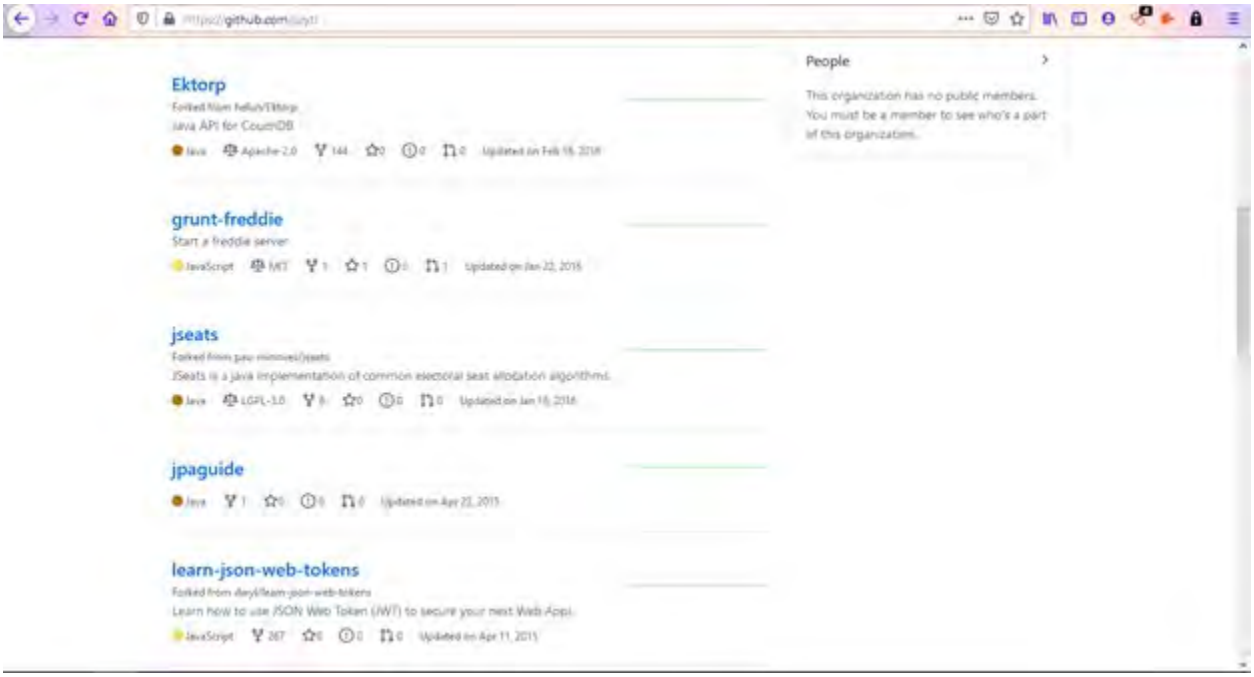
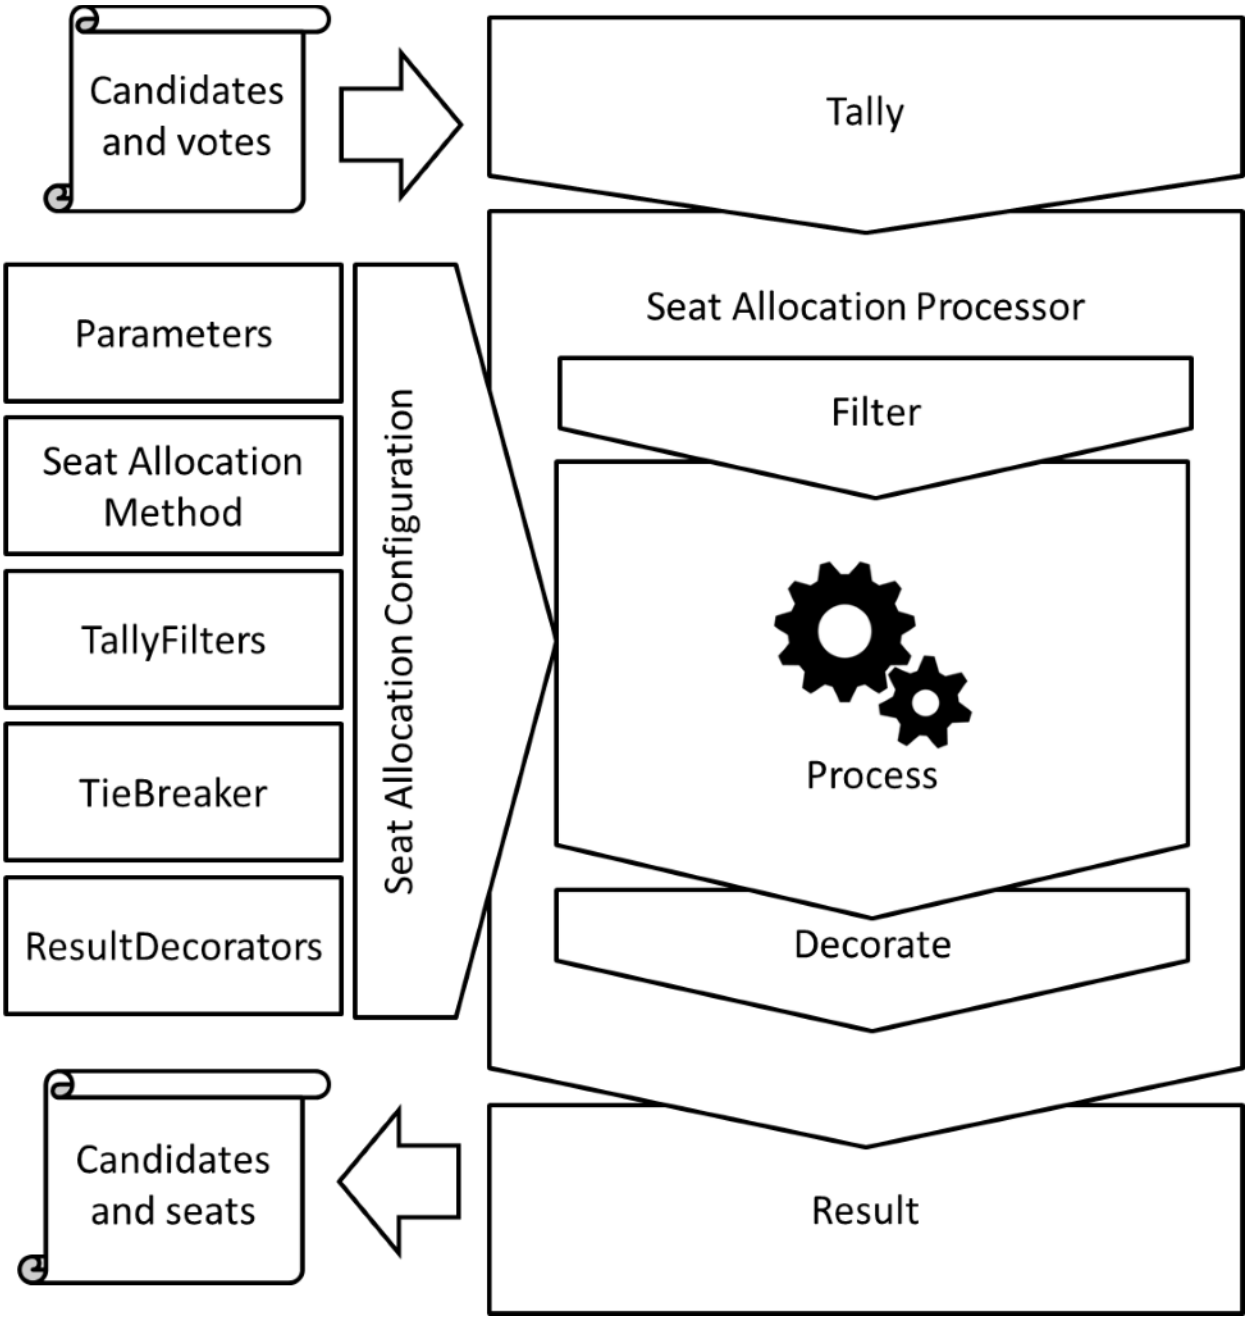
Patent	Publication	Application
1. SYSTEMS AND METHODS FOR PROVIDING SECURITY IN A VOTING MACHINE Inventors: JOHN PAUL HOMEWOOD, THOMAS E. KEELING, PAUL DAVID TERWILLIGER, MARC R. LATOUR		
7111782 Sep 26, 2006	20040238632 Dec 2, 2004	10811969 Mar 30, 2004
2. SYSTEM, METHOD AND COMPUTER PROGRAM FOR VOTE TABULATION WITH AN ELECTRONIC AUDIT TRAIL Inventors: JOHN POULOS, JAMES HOOVER, NICK IKONOMAKIS, GORAN OBRADOVIC		
8195505 Jun 5, 2012	20050247783 Nov 10, 2005	11121997 May 5, 2005
3. SYSTEMS AND METHODS FOR PROVIDING SECURITY IN A VOTING MACHINE Inventors: JOHN PAUL HOMEWOOD, THOMAS E. KEELING, PAUL DAVID TERWILLIGER, MARC R. LATOUR		
7422151 Sep 9, 2008	20070012767 Jan 18, 2007	11526028 Sep 25, 2006
4. BALLOT LEVEL SECURITY FEATURES FOR OPTICAL SCAN VOTING MACHINE CAPABLE OF BALLOT IMAGE PROCESSING, SECURE BALLOT PRINTING, AND BALLOT LAYOUT AUTHENTICATION AND VERIFICATION Inventors: ERIC COOMER, LARRY KORB, BRIAN GLENN LIERMAN		

17. Smartmatic creates the backbone (like the cloud). SCYTL is responsible for the security within the election system.

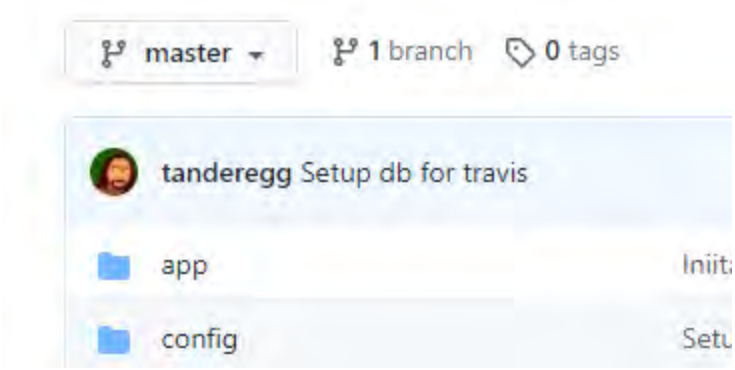




18. In the GitHub account for Scytl, Scytl Jseats has some of the programming necessary to support a much broader set of election types, including a decorator process where the data is smoothed, see the following diagram provided in their source code:



19. Unrelated, but also a point of interest is CTCL or Center for Tech and Civic Life funded by Mark Zuckerberg. Within their github page (https://github.com/ctcl), one of the programmers holds a government position. The Bipcoop repo shows tanderegg as one of the developers, and he works at the Consumer Financial Protection Bureau:



20. As seen in included document titled "AA20-304A-Iranian_Advanced_Persistent_Threat_Actor_Identified_Obtaining_Voter_Registration_Data " that was authored by the Cybersecurity & Infrastructure Security Agency (CISA) with a Product ID of AA20-304A on a specified date of October 30, 2020, CISA and the FBI reports that Iranian APT teams were seen using ACUTENIX, a website scanning software, to find vulnerabilities within Election company websites, confirmed to be used by the Iranian APT teams buy seized cloud storage that I had personally captured and reported to higher authorities. These scanning behaviors showed that foreign agents of aggressor nations had access to US voter lists, and had done so recently.
21. In my professional opinion, this affidavit presents unambiguous evidence that Dominion Voter Systems and Edison Research have been accessible and were certainly compromised by rogue actors, such as Iran and China. By using servers and employees connected with rogue actors and hostile foreign influences combined with numerous easily discoverable leaked credentials, these organizations neglectfully allowed foreign adversaries to access data

and intentionally provided access to their infrastructure in order to monitor and manipulate elections, including the most recent one in 2020. This represents a complete failure of their duty to provide basic cyber security. This is not a technological issue, but rather a governance and basic security issue: if it is not corrected, future elections in the United States and beyond will not be secure and citizens will not have confidence in the results.

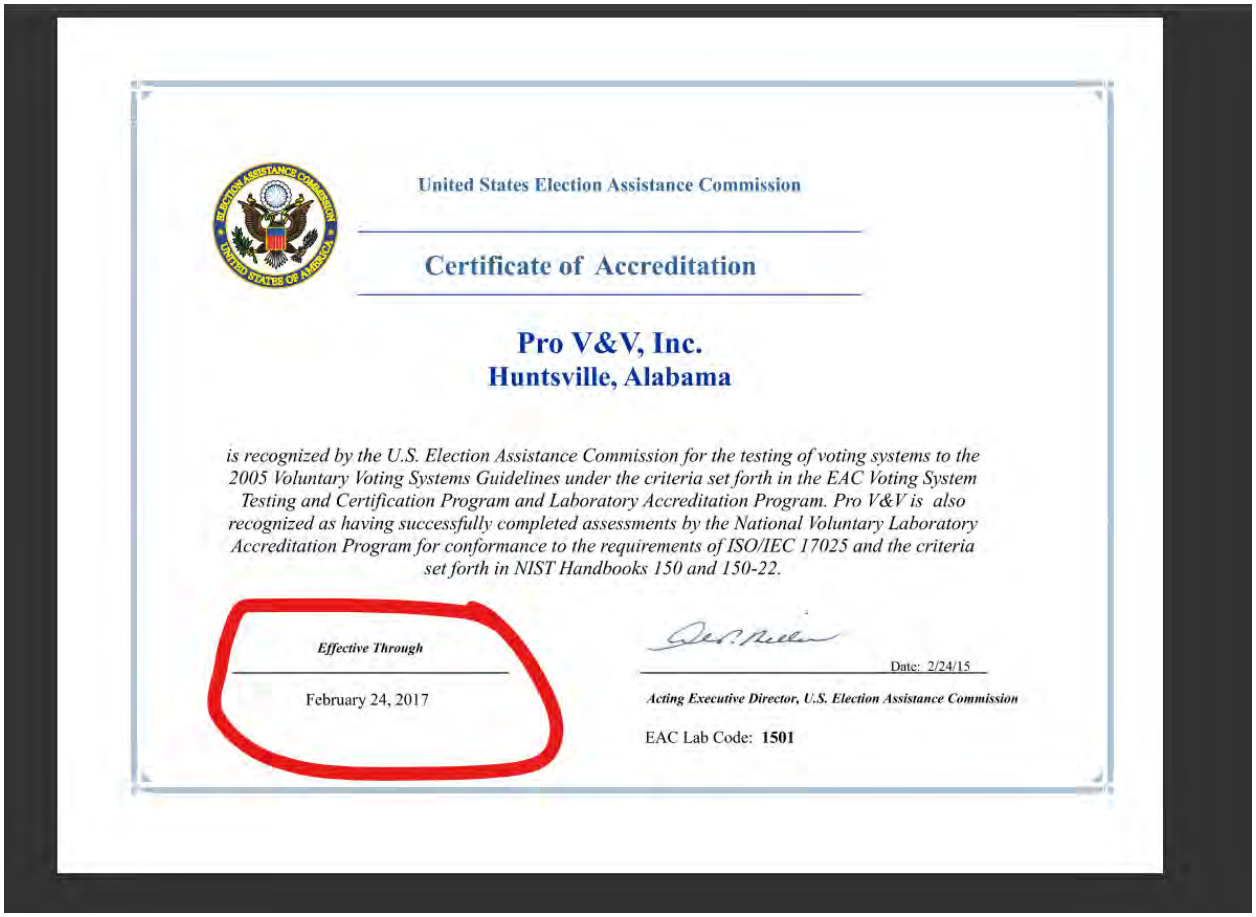
I declare under penalty of perjury that the forgoing is true and correct to the best of my knowledge. Executed this November 23th, 2020.

Declaration of [redacted]

Pursuant to 28 U.S.C Section 1746, I, [redacted], make the following declaration.

1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. I have been a private contractor with experience gathering and analyzing foreign intelligence and acted as a LOCALIZER during the deployment of projects and operations both OCONUS and CONUS. I am a trained Cryptolinguist, hold a completed degree in Molecular and Cellular Physiology and have FORMAL training in other sciences such as Computational Linguistics, Game Theory, Algorithmic Aspects of Machine Learning, Predictive Analytics among others.
3. I have operational experience in sources and methods of implementing operations during elections both CONUS and OCONUS
4. I am an amateur network tracer and cryptographer and have over two decades of mathematical modeling and pattern analysis.
5. In my position from 1999-2014 I was responsible for delegating implementation via other contractors sub-contracting with US or 9 EYES agencies identifying connectivity, networking and subcontractors that would manage the micro operations.
6. My information is my personal knowledge and ability to detect relationships between the companies and validate that with the cryptographic knowledge I know and attest to as well as evidence of these relationships.
7. In addition, I am WELL versed due to my assignments during my time as a private contractor of how elections OCONUS (for countries I have had an assignment at) and CONUS (well versed in HAVA ACT) and more.
8. On or about October 2017 I had reached out to the US Senate Majority Leader with an affidavit claiming that our elections in 2017 may be null and void due to lack of EAC certifications. In fact Sen. Wyden sent a letter to Jack Cobb on 31 OCT 2017 advising discreetly pointing out the importance of being CERTIFIED EAC had issued a certificate to

Pro V & V and that expired on Feb 24, 2017. No other certification has been located.



United States Election Assistance Commission

Certificate of Accreditation

Pro V&V, Inc.
Huntsville, Alabama

is recognized by the U.S. Election Assistance Commission for the testing of voting systems to the 2005 Voluntary Voting Systems Guidelines under the criteria set forth in the EAC Voting System Testing and Certification Program and Laboratory Accreditation Program. Pro V&V is also recognized as having successfully completed assessments by the National Voluntary Laboratory Accreditation Program for conformance to the requirements of ISO/IEC 17025 and the criteria set forth in NIST Handbooks 150 and 150-22.

Effective Through

February 24, 2017

Date: 2/24/15

Acting Executive Director, U.S. Election Assistance Commission

EAC Lab Code: **1501**

9. Section 231(b) of the Help America Vote Act (HAVA) of 2002 (42 U.S.C. §15371(b)) requires that the EAC provide for the accreditation and revocation of accreditation of independent, non-federal laboratories qualified to test voting systems to Federal standards. Generally, the EAC considers for accreditation those laboratories evaluated and recommended by the National Institute of Standards and Technology (NIST) pursuant to HAVA Section 231(b)(1). However, consistent with HAVA Section 231(b)(2)(B), the Commission may also vote to accredit laboratories outside of those recommended by NIST upon publication of an explanation of the reason for any such accreditation.

10. 

United States Department of Commerce
National Institute of Standards and Technology

NVLAP®

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 200978-0

Pro V&V
Huntsville, AL

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Voting System Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).

2020-03-26 through 2021-03-31
Effective Dates

For the National Voluntary Laboratory Accreditation Program

11. VSTL's are VERY important because equipment vulnerabilities allow for deployment of algorithms and scripts to intercept, alter and adjust voting tallies.
12. There are only TWO accredited VSTLs (VOTING SYSTEM TEST LABORATORIES). In order to meet its statutory requirements under HAVA §15371(b), the EAC has developed the EAC's Voting System Test Laboratory Accreditation Program. The procedural requirements of the program are established in the proposed information collection, the EAC **Voting System Test Laboratory Accreditation Program Manual**. Although participation in the program is voluntary, adherence to the program's procedural requirements is mandatory for participants. The procedural requirements of this Manual will supersede any prior laboratory accreditation requirements issued by the EAC. This manual shall be read in conjunction with the EAC's **Voting System Testing and Certification Program Manual** (OMB 3265-0019).

MICHIGAN

State Participation:	**Requires Testing by an Independent Testing Authority.** MI requires that voting systems are certified by an independent testing authority accredited by NASED and the board of state canvassers.
Applicable Statute(s):	"An electronic voting system shall not be used in an election unless it is approved by the board of state canvassers … and unless it meets 1 of the following conditions: (a) Is certified by an independent testing authority accredited by the national association of state election directors and by the board of state canvassers. (b) In the absence of an accredited independent testing authority, is certified by the manufacturer of the voting system as meeting or exceeding the performance and test standards referenced in subdivision (a) in a manner prescribed by the board of state canvassers." MICH. COMP. LAWS ANN § 168.795a (2009).
Applicable Regulation(s):	MI does not have a regulation regarding the federal certification process.
State Certification Process:	The Secretary of State accepts requests from persons/corporations wishing to have their voting system examined. The requestor must pay the Secretary of State an application fee of $1,500.00, file a report listing all of the states in which the voting system has been approved and any reports that these states have made regarding the performance of the voting system. The Board of State Canvassers conducts a field test involving Michigan electors and election officials in simulated election day conditions. The Board of State Canvassers shall approve the voting system if it meets all of the state requirements. MICH. COMP. LAWS ANN § 168.795a (2009).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://www.michigan.gov/sos/0,1607,7-127-1633_8716_45458---,00.html

13.

WISCONSIN

State Participation:

Requires Testing by a Federally Accredited Laboratory. WI requires that its voting systems receive approval from an independent testing authority accredited by NASED verifying that the voting systems meet all of the recommended FEC standards.

Applicable Statute(s):

"No ballot, voting device, automatic tabulating equipment or relating equipment and materials to be used in an electronic voting system may be utilized in this state unless it is approved by the board [of election commissioners]." WIS. STAT.ANN. § 5.91 (West 2009).

Applicable Regulation(s):

"An application for approval of an electronic voting system shall be accompanied by all of the following … [r]eports from an independent testing authority accredited by the national association of state election directors (NASED) demonstrating that the voting system conforms to all the standards recommended by the federal elections commission." WIS. ADMIN. CODE GAB § 7.01 (2009).

State Certification Process:

The Board of Election Commissioners accepts applications for the approval of electronic voting systems. Once the application is completed, the vendor must set up the voting system for three mock elections using; (1) offices, (2) referenda questions and (3) candidates. A panel of local election officials can assist the Board in the review of the voting system. The Board conducts the test using a mock election for the partisan primary, general election, and nonpartisan election. The Board may also require that the voting system be used in an actual election as a condition of the approval. WIS. ADMIN. CODE GAB §§ 7.01, 7.02 (2009).

Fielded Voting Systems:

[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].
http://elections.state.wi.us/section.asp?linkid=643&locid=47

14.

U.S. Election Assistance Commission

GEORGIA

State Participation:	**Requires Federal Certification.** GA requires that its voting systems are tested to EAC standards by EAC accredited labs and certified by the EAC.
Applicable Statute(s):	"Any person or organization owning, manufacturing, or selling, or being interested in the manufacture or sale of, any voting machine may request the Secretary of State to examine the machine. Any ten or more electors of this state may, at any time, request the Secretary of State to reexamine any voting machine previously examined and approved by him or her. Before any such examination or reexamination, the person, persons, or organization requesting such examination or reexamination shall pay to the Secretary of State the reasonable expenses of such examination; provided, however, that in the case of a request by ten or more electors the examination fee shall be $ 250.00. The Secretary of State may, at any time, in his or her discretion, reexamine any voting machine." GA CODE ANN. § 21-2-324 (2008).
Applicable Regulation(s):	"Prior to submitting a voting system for certification by the State of Georgia, the proposed voting system's hardware, firmware, and software must have been issued Qualification Certificates from the EAC. These EAC Qualification Certificates must indicate that the proposed voting system has successfully completed the EAC Qualification testing administered by EAC approved ITAs. If for any reason, this level of testing is not available, the Qualification tests shall be conducted by an agency designated by the Secretary of State. In either event, the Qualification tests shall comply with the specifications of the *Voting Systems Standards* published by the EAC." GA. COMP. R. & RES. 590-8-1-.01 (2009).
State Certification Process:	After the voting system has passed EAC Qualification testing, the vendor of the voting system submits a letter to the Office of the Secretary of State requesting certification for the voting system along with a technical data package to the certification agent. An evaluation proposal is created by the certification agent after a preliminary view of the Technical Data Package and sent to the vendor. Any additional EAC ITA testing identified in the evaluation proposal is arranged by the vendor and the certification agent will perform all other tests identified in the evaluation proposal. The certification agent submits a report of their findings to the Secretary of State. Based on these findings the Secretary of State will make a final determination on whether to certify the voting system. GA. COMP. R. & RES. 590-8-1-.01 (2009).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://www.sos.georgia.gov/Elections/

15.

PENNSYVANIA

State Participation:	**Requires Testing by a Federally Accredited Laboratory.** PA requires that its voting systems are approved by a federally recognized independent testing laboratory as meeting federal voting system standards.
Applicable Statute(s):	"Any person or corporation owning, manufacturing or selling, or being interested in the manufacture or sale of, any electronic voting system, may request the Secretary of the Commonwealth to examine such system if the voting system has been examined and approved by a federally recognized independent testing authority and if it meets any voting system performance and test standards established by the Federal Government." 25 PA. CONS. STAT. ANN. Code § 3031.5 (West 2008).
Applicable Regulation(s):	PA does not have a regulation regarding the federal certification process.
State Certification Process:	The Secretary of State examines voting systems, upon request, once the voting systems have received approval by a federally recognized independent testing authority. The person(s) requesting the examination of the voting system are responsible for the cost of the examination. After the examination, the Secretary of State issues a report stating whether or not the voting systems are safe and compliant with state and federal requirements. If the voting systems are deemed safe and compliant by the Secretary of State then the systems may be adopted and approved for use in elections by each county through a majority vote of its qualified electors. 25 PA. CONS. STAT. ANN. Code §§ 3031.5, 3031.2 (West 2008).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://www.votespa.com/HowtoVote/tabid/74/language/en-US/Default.aspx

16.

U.S. Election Assistance Commission

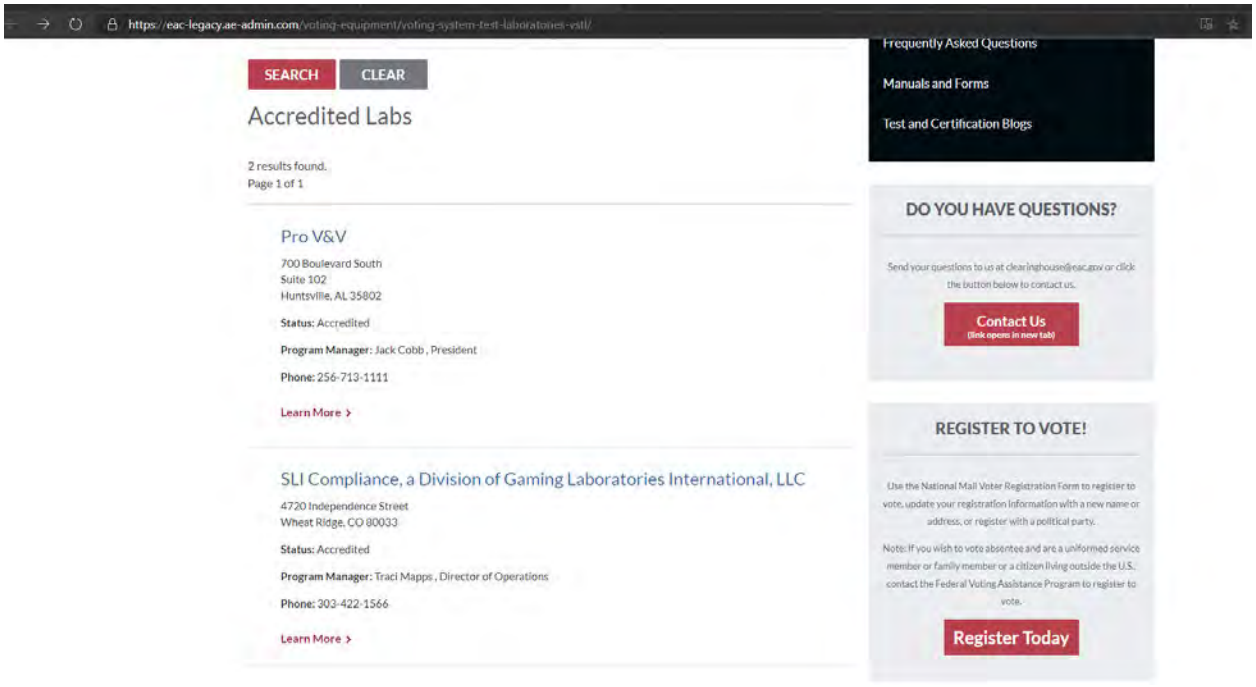
ARIZONA

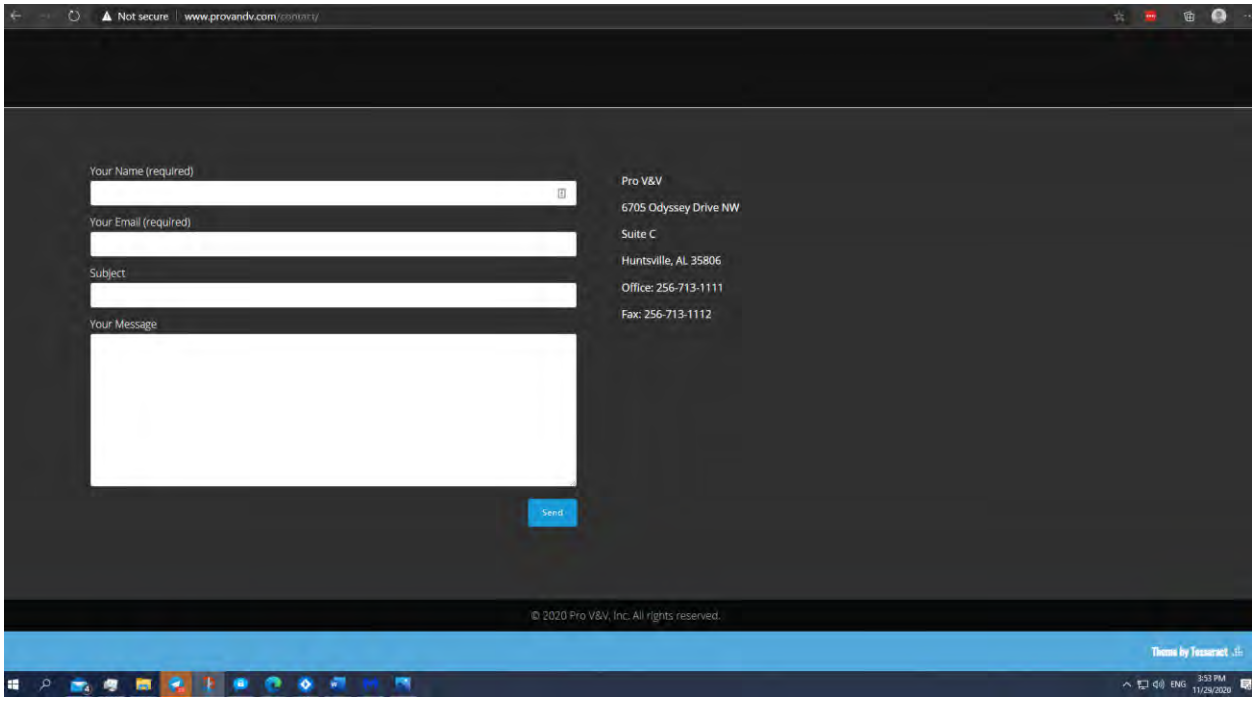
State Participation:	**Requires Testing by a Federally Accredited Laboratory.** AZ requires that its voting systems are HAVA compliant and approved by a laboratory that is accredited pursuant to HAVA.
Applicable Statute(s):	"On completion of acquisition of machines or devices that comply with HAVA, machines or devices used at any election for federal, state or county offices may only be certified for use in this state and may only be used in this state if they comply with HAVA and if those machines or devices have been tested and approved by a laboratory that is accredited pursuant to HAVA." ARIZ. REV. STAT. § 16-442(B) (2008).
Applicable Regulation(s):	AZ does not have a regulation regarding the federal certification process.
State Certification Process:	The Secretary of State appoints a committee of three people that test different voting systems. This committee is required to submit their recommendations to the Secretary of State who then makes the final decision on which voting system(s) to adopt. ARIZ. REV. STAT. § 16-442(A) and (C) (2008).
Fielded Voting Systems:	*[After the EAC completes and issues the 2008 Election Administration and Voting Survey, information about fielded voting systems will be added to this document. In the meantime, readers may find information on the voting systems at the following website (if available)].* http://www.azsos.gov/election/equipment/default.htm

17.

18. **Pro V& V** and **SLI Gaming** both lack evidence of EAC Accreditation as per the Voting System Testing and Certification Manual.

19. **Pro V& V** is owned and Operated by Jack Cobb. Real name is Ryan Jackson Cobb. The company ProV&V was founded and run by Jack Cobb who formerly worked under the entity of Wyle Laboratories which is an AEROSPACE DEFENSE CONTRACTING ENTITY. The address information on the EAC, NIST and other entities for Pro V& V are different than that of what is on ProV&V website. The EAC and NIST (ISO CERT) issuers all have another address.





20. VSTLs are the most important component of the election machines as they examine the use of COTS (Commercial Off–The-Shelf)
21. "Wyle became involved with the testing of electronic voting systems in the early 1990's and has tested over 150 separate voting systems. Wyle was the first company to obtain accreditation by the National Association of State Election Directors (NASED). Wyle is accredited by the Election Assistance Commission (EAC) as a Voting System Testing Laboratory (VSTL). Our scope of accreditation as a VSTL encompasses all aspects of the hardware and software of a voting machine. Wyle also received NVLAP accreditation to ISO/IEC 17025:2005 from NIST." Testimony of Jack Cobb 2009
22. COTS are preferred by many because they have been tried and tested in the open market and are most economic and readily available. COTS are also the SOURCE of vulnerability therefore VSTLs are VERY important. COTS components by voting system machine manufacturers can be used as a "Black Box" and changes to their specs and hardware make up change continuously. Some changes can be simple upgrades to make them more efficient in operation, cost efficient for production, end of life (EOL) and even complete reworks to meet new standards. They key issue in this is that MOST of the COTS used by Election Machine Vendors like Dominion, ES&S, Hart Intercivic, Smartmatic and others is that such manufacturing for COTS have been outsourced to China which if implemented in our Election Machines make us vulnerable to BLACK BOX antics and backdoors due to hardware changes that can go undetected. This is why VSTL's are VERY important.
23. The proprietary voting system software is done so and created with cost efficiency in mind and therefore relies on 3rd party software that is AVAILABLE and HOUSED on the HARDWARE. This is a vulnerability. Exporting system reporting using software like Crystal Reports, or PDF software allows for vulnerabilities with their constant updates.
24. As per the COTS hardware components that are fixed, and origin may be cloaked under proprietary information a major vulnerability exists since once again third-party support software is dynamic and requires FREQUENT updates. The hardware components of the computer components, and election machines that are COTS may have slight updates that can be overlooked as they may be like those designed that support the other third -party software. COTS origin is important and the US Intelligence Community report in 2018 verifies that.
25. The Trump Administration made it clear that there is an absence of a major U.S. alternative to foreign suppliers of networking equipment. This highlights the growing dominance of

Chinese manufacturers like Huawei that are the world's LARGEST supplier of telecom and other equipment that endangers national security.

26. China, is not the only nation involved in COTS provided to election machines or the networking but so is Germany via a LAOS founded Chinese linked cloud service company that works with SCYTL named Akamai Technologies that have offices in China and are linked to the server that Dominion Software.

28. L3 Level Communications is federal contractor that is partially owned by foreign lobbyist George Soros. An article that AP ran in 2010 – spoke out about the controversy of this that has been removed. (LINK) "As for the company's other political connections, it also appears that none other than George Soros, the billionaire funder of the country's liberal political infrastructure, owns 11,300 shares of OSI Systems Inc., the company that owns Rapiscan. Not surprisingly, OSI's stock has appreciated considerably over the course of the year. Soros certainly is a savvy investor." Washington Examiner re-write.

31. **L-3 Communication** Systems-East designs, develops, produces and integrates communication systems and support equipment for space, air, ground, and naval applications, including C4I systems and products; integrated Navy communication systems; integrated space communications and RF payloads; recording systems; secure communications, and information security systems. In addition, their site claims that MARCOM is an integrated communications system and The Marcom® is the foundation of the Navy's newest digital integrated voice / data switching system for affordable command and control equipment supporting communications and radio room automation. The MarCom® uses the latest **COTS** digital technology and open systems standards to offer the command and control user a low cost, user friendly, solution to the complex voice, video and data communications needs of present and future joint / allied missions. Built in reliability, rugged construction, and fail-safe circuits ensure your call and messages will go through. Evidently a HUGE vulnerability.

32. Michigan's government site is thumped off Akamai Technologies servers which are housed on **TELIA AB** a foreign server located in Germany.
33. Scytl, who is contracted with AP that receives the results tallied BY Scytl on behalf of Dominion – During the elections the AP reporting site had a disclaimer.
    AP – powered by SCYTL.

34. “Scytl was selected by the Federal Voting Assistance Program of the U.S. Department of Defense to provide a secure online ballot delivery and onscreen marking systems under a program to support overseas military and civilian voters for the 2010 election cycle and beyond. Scytl was awarded 9 of the 20 States that agreed to participate in the program (New York, Washington, Missouri, Nebraska, Kansas, New Mexico, South Carolina, Mississippi and Indiana), making it the provider with the highest number of participating States.” PDF
35. According to DOMINION : 1.4.1Software and Firmware The software and firmware employed by Dominion D-Suite 5.5-Aconsists of 2 types, custom and commercial off the shelf (COTS). COTS applications were verified to be pristine or were subjected to source code review for analysis of any modifications and verification of meeting the pertinent standards.
36. The concern is the HARDWARE and the NON – ACCREDITED VSTLs as by their own admittance use COTS.
37. The purpose of VSTL’s being accredited and their importance in ensuring that there is no foreign interference/ bad actors accessing the tally data via backdoors in equipment software. The core software used by ALL SCYTL related Election Machine/Software manufacturers ensures “anonymity” .
38. Algorithms within the area of this “shuffling” to maintain anonymity allows for setting values to achieve a desired goal under the guise of “encryption” in the trap-door.
39. The actual use of trapdoor commitments in Bayer-Groth proofs demonstrate the implications for the verifiability factor. This means that no one can SEE what is going on during the process of the “shuffling” therefore even if you deploy an algorithms or manual scripts to fractionalize or distribute pooled votes to achieve the outcome you wish – you cannot prove they are doing it! See STUDY : “The use of trapdoor commitments in Bayer-Groth proofs and the implications for the verifiability of the Scytl-SwissPost Internet voting system”
40. **Key Terms**
41. **UNIVERSAL VERIFIABILITY**: Votes cast are the votes counted and integrity of the vote is verifiable (the vote was tallied for the candidate selected) . **SCYTL FAILS UNIVERSAL VERIFIABILITY** because no mathematical proofs can determine if any votes have been manipulated.
42. **INDIVIDUAL VERIFIABILITY**: Voter cannot verify if their ballot got correctly counted. Like, if they cast a vote for ABC they want to verify it was ABC. That notion clearly discounts the need for anonymity in the first place.

43. To understand what I observed during the 2020 I will walk you through the process of one ballot cast by a voter.
44. STEP 1 |Config Data | All non e-voting data is sent to Scytl (offshore) for configuration of data. All e-voting is sent to CONFIGURATION OF DATA then back to the e-voting machine and then to the next phase called CLEANSING. **CONCERNS**: Here we see an "OR PROOF" as coined by mathematicians – an "or proof" is that votes that have been pre-tallied parked in the system and the algorithm then goes back to set the outcome it is set for and seeks to make adjustments if there is a partial pivot present causing it to fail demanding manual changes such as block allocation and narrowing of parameters or self-adjusts to ensure the predetermined outcome is achieved.
45. STEP 2|CLEANSING | The Process is when all the votes come in from the software run by Dominion and get "cleansed" and put into 2 categories: invalid votes and valid votes.
46. STEP 3|Shuffling /Mixing | This step is the most nefarious and exactly where the issues arise and carry over into the decryption phase. Simply put, the software takes all the votes, literally mixes them a and then re-encrypts them. This is where if ONE had the commitment key- TRAPDOOR KEY – one would be able to see the parameters of the algorithm deployed as the votes go into this mixing phase, and how algorithm redistributes the votes.
47. This published PAPER FROM University College London depicts how this shuffle works. In essence, when this mixing/shuffling occurs, then one doesn't have the ability to know that vote coming out on the other end is actually their vote; therefore, ZERO integrity of the votes when mixed.

48.

Background - ElGamal encryption

- Setup: Group $\mathcal{G}$ of prime order q with generator g
- Public key: $pk = y = g^x$
- Encryption: $\mathcal{E}_{pk}(m; r) = (g^r, y^r m)$
- Decryption: $\mathcal{D}_x(u, v) = vu^{-x}$
- Homomorphic:

$$\mathcal{E}_{pk}(m; r) \times \mathcal{E}_{pk}(M; R) = \mathcal{E}_{pk}(mM; r + R)$$

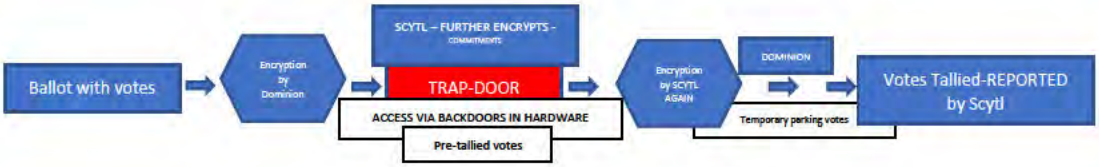
- Re-encryption:

$$\mathcal{E}_{pk}(m; r) \times \mathcal{E}_{pk}(1; R) = \mathcal{E}_{pk}(m; r + R)$$

UCL

49. When this mixing/shuffling occurs, then one doesn't have the ability to know that vote coming out on the other end is actually their vote; therefore, ZERO integrity of the votes.
50. When the votes are sent to Scytl via Dominion Software EMS (Election Management System) the Trap Door is accessed by Scytl or TRAP DOOR keys (Commitment Parameters).

51.



52. The encrypted data is shifted into Scytl's platform in the form of ciphertexts – this means it is encrypted and a key based on commitments is needed to read the data. The ballot data can only be read if the person has a key that is set on commitments.
53. A false sense of security is provided to both parties that votes are not being "REPLACED" during the mixing phase. Basically, Scytl re-encrypts the ballot data that comes in from Dominion (or any other voting software company) as ciphertexts. Scytl is supposed to prove that votes A, B, C are indeed X, Y, Z under their new re-encryption when sending back the votes that are tallied coding them respectively. This is done by Scytl and the Election Software company that agrees to certain

"Generators" and therefore together build "commitments."

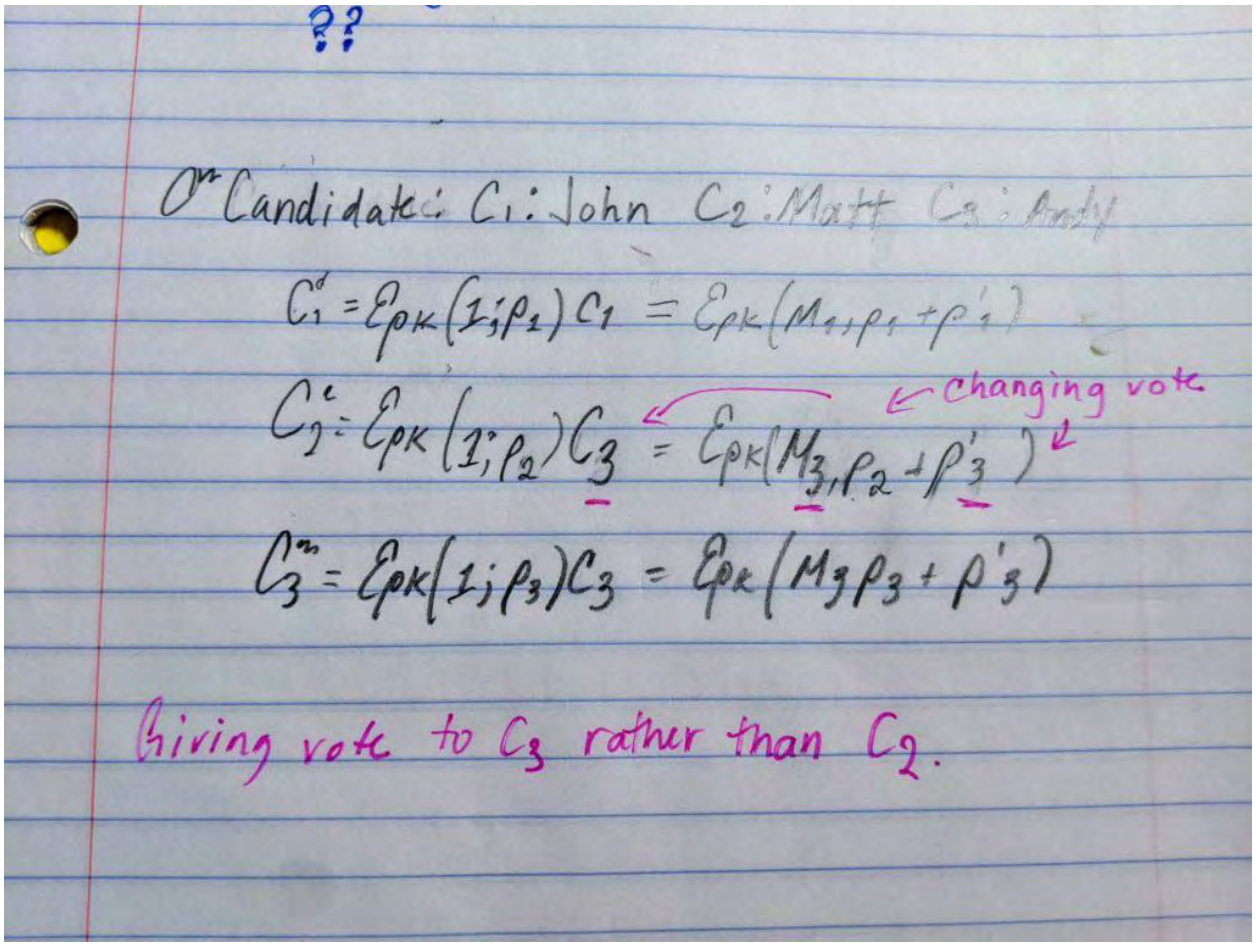
```
public CommitmentParams(final ZpSubgroup group, final int n) {
    group = group;
    h = GroupTools.getRandomElement(group);
    commitmentlength = n;
    g = GroupTools.getVectorRandomElement(group,
this.commitmentlength);
    }

    // from getRandomElement(group)
Exponent randomExponent = ExponentTools.getRandomExponent(group.getQ());
return group.getGenerator().exponentiate(randomExponent);
```

54. Scytl and Dominion have an agreement – only the two would know the parameters. This means that access is able to occur through backdoors in hardware if the parameters of the commitments are known in order to alter the range of the algorithm deployed to satisfy the outcome sought in the case of algorithm failure.
55. Trapdoor is a cryptotech term that describes a state of a program that knows the commitment parameters and therefore is able change the value of the commitments however it likes. In other words, Scytl or anyone that knows the commitment parameters can take all the votes and give them to any one they want. If they have a total of 1000 votes an algorithm can distribute them among all races as it deems necessary to achieve the goals it wants. (Case Study: Estonia)

56. 
57. Within the trapdoor this is how the algorithm behaves to move the goal posts in elections without being detected by this proof . During the mixing phase this is the algorithm you would use to

"reallocate" votes via an algorithm to achieve the goal set.



58. STEP 4|Decryption would be the decryption phase and temporary parking of vote tallies before reporting. In this final phase before public release the tallies are released from encrypted format into plain text. As previously explained, those that know the trapdoor can easily change any votes that the randomness is applied and used to generate the tally vote ciphertext. Thus in this case, Scytl who is the mixer can collude with their vote company clients or an agency (-------) to change votes and get away with it. This is because the receiver doesn't have the decryption key so they rely solely on Scytl to be ***honest*** or free from any foreign actors within their backdoor or the Election Company (like Dominion) that can have access to the key.
59. In fact, a study from the University of Bristol made claim that interference can be seen when there is a GREAT DELAY in reporting and finalizing numbers University of Bristol : How not to Prove Yourself: Pitfalls of the Fiat-Shamir Heuristic and Applications to Helios
60. "Zero-knowledge proofs of knowledge allow a prover to convince a verifier that she holds information satisfying some desirable properties without revealing anything else." David Bernhard, Olivier Pereira,and Bogdan Warinschi.

61. Hence, you can't prove anyone manipulated anything. The TRAP DOOR KEY HOLDERS can offer you enough to verify to you what you need to see without revealing anything and once again indicating the inability to detect manipulation. **ZERO PROOF of INTEGRITY OF THE VOTE.**
62. Therefore, if decryption is challenged, the administrator or software company that knows the trap door key can provide you proof that would be able to pass verification (blind). This was proven to be factually true in the case study by The University of Melbourne in March. White Hat Hackers purposely altered votes by knowing the parameters set in the commitments and there was no way to prove they did it – or any way to prove they didn't.
63. IT'S THE PERFECT THREE CARD MONTY. That's just how perfect it is. They fake a proof of ciphertexts with KNOWN "RANDOMNESS" .This rolls back to the integrity of the VOTE. The vote is not safe using these machines not only because of the method used for ballot "cleansing" to maintain anonymity but the EXPOSURE to foreign interference and possible domestic bad actors.
64. In many circumstances, manipulation of the algorithm is NOT possible in an undetectable fashion. This is because it is one point heavy. Observing the elections in 2020 confirm the deployment of an algorithm due to the BEHAVIOR which is indicative of an algorithm in play that had no pivoting parameters applied.
65. The behavior of the algorithm is that one point (B) is the greatest point within the allocated set. It is the greatest number within the A B points given. Point A would be the smallest. Any points outside the A B points are not necessarily factored in yet can still be applied.
66. The points outside the parameters can be utilized to a certain to degree such as in block allocation.
67. The algorithm geographically changed the parameters of the algorithm to force blue votes and ostracize red.
68. Post block allocation of votes the two points of the algorithm were narrowed ensuring a BIDEN win hence the observation of NO Trump Votes and some BIDEN votes for a period of time.

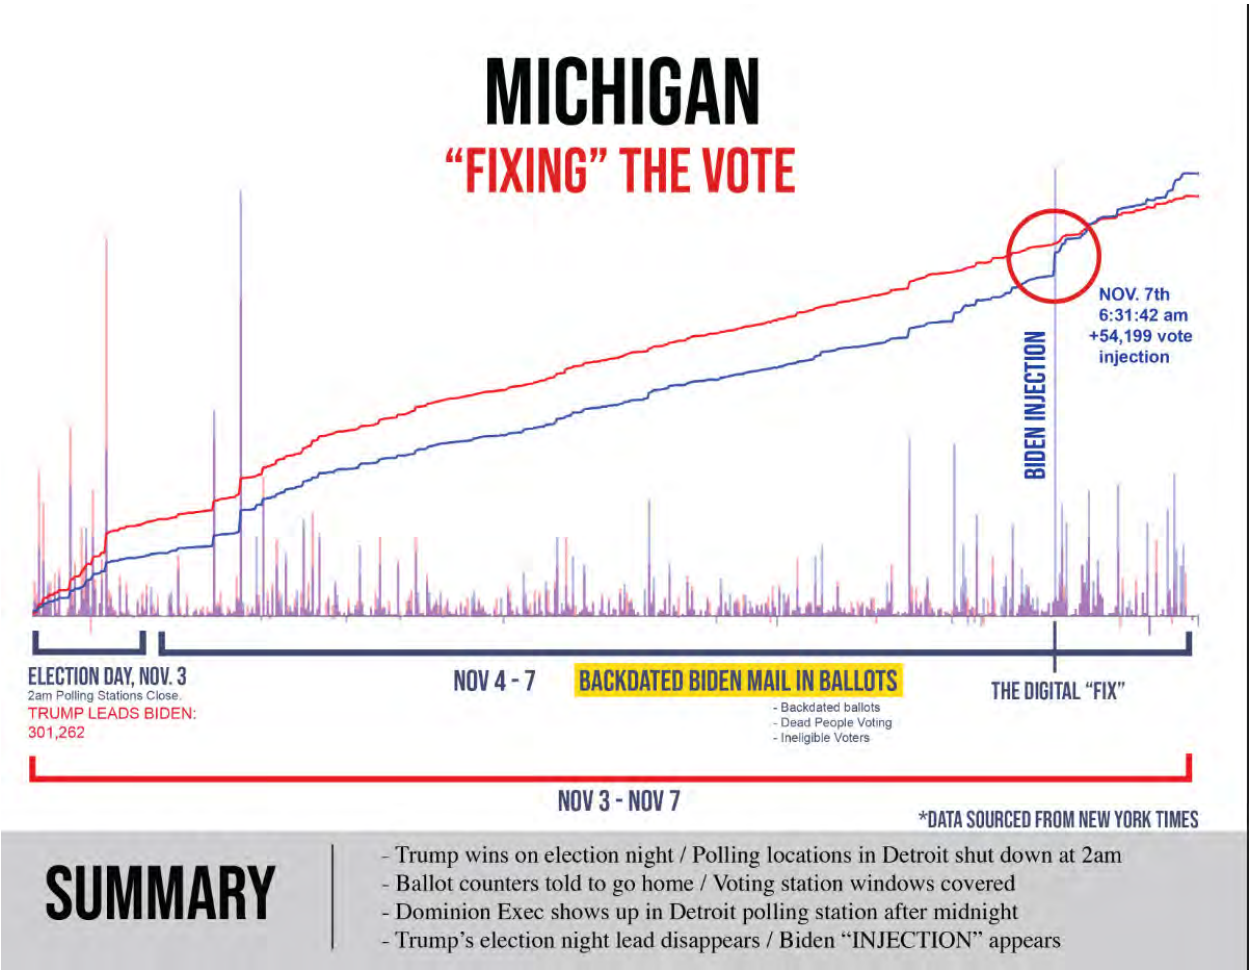
+143,100 votes
(Maricopa & Pima)
NUMBER OF VOTES PROCESSED & THE TIME AT WHICH THEY PROCESSED
ELECTION DAY
NOV 4 - 10
NOV 3 - NOV 10
*DATA SOURCED FROM NEW YORK TIMES
SUMMARY
- Mathematical evidence of the seeding "injection" of votes at the beginning
- A spike means that a large number of votes were injected into the totals
- A normal vote pattern would look like a natural progression – smooth without extreme jumps

70. Gaussian Elimination without pivoting explains how the algorithm would behave and the election results and data from Michigan confirm FAILURE of algorithm.



71. The "Digital Fix" observed with an increased spike in VOTES for Joe Biden can be determined as evidence of a pivot. Normally it would be assumed that the algorithm had a Complete Pivot. Wilkinson's demonstrated the guarantee as :

$$\frac{\|U\|_\infty}{\|A\|_\infty} \leq n^{\frac{1}{2}\log(n)}$$

72.

73. Such a conjecture allows the growth factor the ability to be upper bound by values closer to n. Therefore, complete pivoting can't be observed because there would be too many floating points. Nor can partial as the partial pivoting would overwhelm after the "injection" of votes. Therefore, external factors were used which is evident from the "DIGITAL FIX"

74. Observing the elections, after a review of Michigan's data a spike of 54,199 votes to Biden. Because it is pushing and pulling and keeping a short distance between the 2 candidates; but then a spike, which is how an algorithm presents; - and this spike means there was a pause and an insert was made, where they insert an algorithm. Block spikes in votes for JOE BIDEN were NOT paper

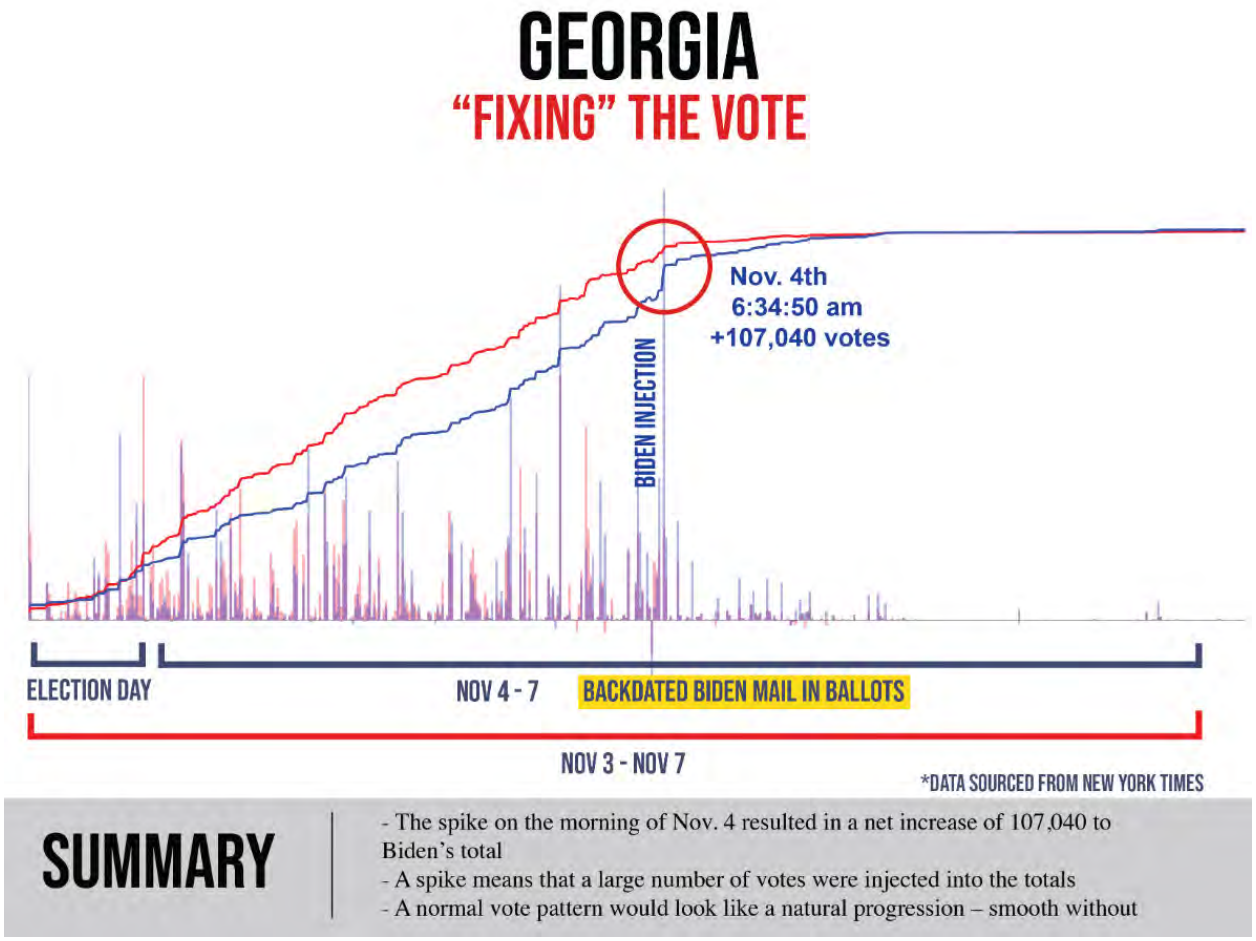
ballots being fed or THUMB DRIVES. The algorithm block adjusted itself and the PEOPLE were creating the evidence to BACK UP the block allocation.

75. I have witnessed the same behavior of the election software in countries outside of the United States and within the United States. In -------, the elections conducted behaved in the same manner by allocating BLOCK votes to the candidate "chosen" to win.

76. Observing the data of the contested states (and others) the algorithm deployed is identical to that which was deployed in 2012 providing Barack Hussein Obama a block allocation to win the 2012 Presidential Elections.

77. The algorithm looks to have been set to give Joe Biden a 52% win even with an initial 50K+ vote block allocation was provided initially as tallying began (as in case of Arizona too). In the am of November 4, 2020 the algorithm stopped working, therefore another "block allocation" to remedy the failure of the algorithm. This was done manually as ALL the SYSTEMS shut down NATIONWIDE to avoid detection.

78.



79. In Georgia during the 2016 Presidential Elections a failed attempt to deploy the scripts to block allocate votes from a centralized location where the "trap-door" key lay an attempt by someone using

the DHS servers was detected by the state of GA. The GA leadership assumed that it was "Russians" but later they found out that the IP address was that of DHS.

80. In the state of Wisconsin, we observed a considerable BLOCK vote allocation by the algorithm at the SAME TIME it happened across the nation. All systems shut down at around the same time.

81. 
82. In Wisconsin there are also irregularities in respect to BALLOT requests. (names AND address Hidden for privacy)

FACT SHEET: U.S. Crisis Support Package for Ukraine

President Obama and Vice President Biden have made U.S. support for Ukraine an urgent priority as the Ukrainian government works to establish security and stability, pursue democratic elections and constitutional reform, revive its economy, and ensure government institutions are transparent and accountable to the Ukrainian people. Ukraine embarks on this reform path in the face of severe challenges to its sovereignty and territorial integrity, which we are working to address together with Ukraine and our partners in the international community. The United States is committed to ensuring that Ukrainians alone are able to determine their country's future without intimidation or coercion from outside forces. To support Ukraine, we are today announcing a new package of assistance totaling **$50 million** to help Ukraine pursue political and economic reform and strengthen the partnership between the United States and Ukraine.

90.

91. Right before the ----- elections it was alleged that CyberBerkut a pro-Russia group infiltrated --- central election computers and **deleted key files**. These actions supposedly rendered the vote-tallying system inoperable.
92. In fact, the KEY FILES were the Commitment keys to allow Scytl to tally the votes rather than the election machines. The group had disclosed emails and other documents proving that their election was rigged and that they tried to avoid a fixed election.
93. The elections were held on May 25, 2014 but in the early AM hours the election results were BLOCKED and the final tally was DELAYED flipping the election in favor of -----.
94. The claim was that there was a DDoS attack by Russians when in actual fact it was a mitigation of the algorithm to inject block votes as we observed was done for Joe Biden because the KEYS were unable to be deployed. In the case of -----, the trap-door key was "altered"/deleted/ rendered ineffective. In the case of the US elections, representatives of Dominion/ ES&S/ Smartmatic/ Hart Intercivic would have to manually deploy them since if the entry points into the systems seemed to have failed.
95. The vote tallying of all states NATIONWIDE stalled and hung for days – as in the case of Alaska that has about 300K registered voters but was stuck at 56% reporting for almost a week.
96. This "hanging" indicates a failed deployment of the scripts to block allocate remotely from one location as observed in ------ on May 26, 2014.
97. This would justify the presence of the election machine software representatives making physical appearances in the states where the election results are currently being contested.
98. A Dominion Executive appeared at the polling center in Detroit after midnight.
99. Considering that the hardware of the machines has NOT been examined in Michigan since 2017 by Pro V& V according to Michigan's own reporting. COTS are an avenue that hackers and bad actors seek to penetrate in order to control operations. Their software updates are the reason vulnerabilities to foreign interference in all operations exist.
100. The importance of VSTLs in underrated to protect up from foreign interference by way of open access via COTS software. Pro V& V who's EAC certification EXPIRED on 24 FEB 2017 was contracted with the state of WISCONSIN.
101. In the United States each state is tasked to conduct and IV& V (Independent Verification and Validation) to provide assurance of the integrity of the votes.
102. If the "accredited" non-federal entities have NOT received EAC accreditation this is a failure of the states to uphold their own states standards that are federally regulated.
103. In addition, if the entities had NIST certificates they are NOT sufficing according the HAVA ACT 2002 as the role of NIST is clear.
104. Curiously, both companies PRO V&V and SLI GAMING received NIST certifications OUTSIDE the 24 month scope.

105. PRO V& V received a NIST certification on 26MAR2020 for ONE YEAR. Normally the NIST certification is good for two years to align with that of EAC certification that is good for two years.

106.

NVLAP®

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 200978-0

Pro V&V
Huntsville, AL

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Voting System Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).

2020-03-26 through 2021-03-31
Effective Dates

DEPARTMENT OF COMMERCE * UNITED STATES OF AMERICA

For the National Voluntary Laboratory Accreditation Program

107. The last PRO V& V EAC accreditation certificate (Item 8) of this declaration expired in February 2017 which means that the IV & V conducted by Michigan claiming that they were accredited is false.

108. The significance of VSTLs being accredited and examining the HARDWARE is key. COTS software updates are the avenues of entry.

109. As per DOMINION'S own petition, the modems they use are COTS therefore failure to have an accredited VSTL examine the hardware for points of entry by their software is key.

*Compact Flash Cards	***SanDisk Ultra: SDCFHS-004G SDCFHS-008G RiData: CFC-14A RDF8G-233XMCB2-1 RDF16G-233XMCB2-1 RDF32G-233XMCB2-1 SanDisk Extreme: SDCFX-016G SDCFX-032G SanDisk: SDFAA-008G		Memory device for ICP and ICE tabulators.
*Modems	Verizon USB Modem Pantech UMW190NCD USB Modem MultiTech MT9234MU CellGo Cellular Modem E-Device 3GPUSUS AT&T USB Modem MultiTech GSM MTD-H5 Fax Modem US Robotics 56K V.92.		Analog and wireless modems for transmitting unofficial election night results.

110.

111. For example and update of Verizon USB Modem Pantech undergoes multiple software updates a year for it's hardware. That is most likely the point of entry into the systems.

112. During the 2014 elections in ---- it was the modems that gave access to the systems where the commitment keys were deleted.

113. SLI Gaming is the other VSTL "accredited" by the EAC BUT there is no record of their accreditation. In fact, SLI was NIST ISO Certified 27 days before the election which means that PA IV&V was conducted without NIST cert for SLI being valid.

Effective Dates

For the National Voluntary Laboratory Accreditation Program

115. In fact SLI was NIST ISO Certified for less than 90 days.

116. I can personally attest that high-level officials of the Obama/Biden administration and large private contracting firms met with a software company called GEMS which is ultimately the software ALL election machines run now running under the flag of DOMINION.

117. GEMS was manifested from SOE software purchased by SCYTL developers and US Federally Funded persons to develop it.

118. The only way GEMS can be deployed across ALL machines is IF all counties across the nation are housed under the same server networks.

119. GEMS was tasked in 2009 to a contractor in Tampa, Fl.

120. GEMS was also fine-tuned in Latvia, Belarus, Serbia and Spain to be localized for EU deployment as observed during the Swissport election debacle.

121. John McCain's campaign assisted in FUNDING the development of GEMS web monitoring via WEB Services with 3EDC and Dynology.

123.

124. AKAMAI Technologies services SCYTL.

125. AKAMAI Technologies Houses ALL foreign government sites. (Please see White Paper by Akamai.)

126. AKAMAI Technologies houses ALL .gov state sites. (ref Item 123 Wisconsin.gov Example)

127. 

128. Wisconsin has EDGE GATEWAY port which is AKAMAI TECHNOLOGIES based out of GERMANY.

129. Using AKAMAI Technologies is allowing .gov sites to obfuscate and mask their systems by way of HURRICANE ELECTRIC (he.net) Kicking it to anonymous (AKAMAI Technologies) offshore servers.

130. 
131. AKAMAI Technologies has locations around the world.

132. AKAMAI Technologies has locations in China (ref item 22)

133. AKAMAI Technologies has locations in Iran as of 2019.

134. AKAMAI Technologies merged with UNICOM (CHINESE TELECOMM) in 2018.

135. AKAMAI Technologies house all state .gov information in GERMANY via TELIA AB.

136. In my professional opinion, this affidavit presents unambiguous evidence:

137. That there was Foreign interference, complicit behavior by the previous administrations from 1999 up until today to hinder the voice of the people and US persons knowingly and willingly colluding with foreign powers to steer our 2020 elections that can be named in a classified setting.

138. Foreign interference is present in the 2020 election in various means namely,

139. Foreign nationals assisted in the creation of GEMS (Dominion Software Foundation)

140. Akamai Technologies merged with a Chinese company that makes the COTS components of the election machines providing access to our electronic voting machines.

141. Foreign investments and interests in the creation of the GEMS software.

142. US persons holding an office and private individuals knowingly and willingly oversaw fail safes to secure our elections.

143. The EAC failed to abide by standards set in HAVA ACT 2002.

144. The IG of the EAC failed to address complaints since their appointment regarding vote integrity

145. Christy McCormick of the EAC failed to ensure that EAC conducted their duties as set forth by HAVA ACT 2002

146. Both Patricia Layfield (IG of EAC) and Christy McCormick (Chairwoman of EAC) were appointed by Barack Hussein Obama and have maintained their positions since then.

147. The EAC failed to have a quorum for over a calendar year leading to the inability to meet the standards of the EAC.

148. AKAMAI Technologies and Hurricane Electric raise serious concerns for NATSEC due to their ties with foreign hostile nations.

149. For all the reasons above a complete failure of duty to provide safe and just elections are observed.

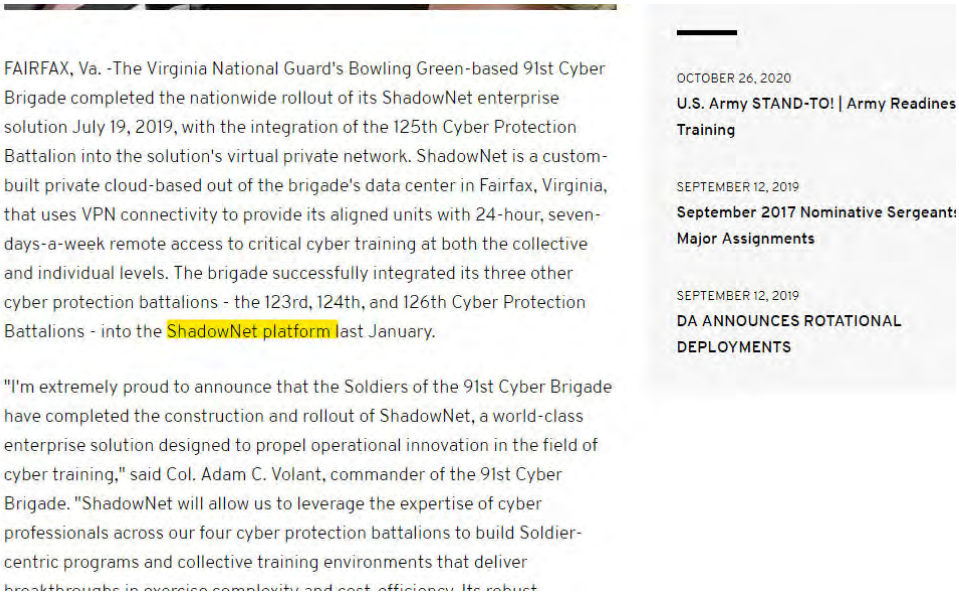
150. For the people of the United States to have confidence in their elections our cybersecurity standards should not be in the hands of foreign nations.

151. Those responsible within the Intelligence Community directly and indirectly by way of procurement of services should be held accountable for assisting in the development, implementation and promotion of GEMS.

152. GEMS ------- General Hayden.

153. In my opinion and from the data and events I have observed ---------- with the assistance of SHADOWNET under the guise of L3-Communications which is MPRI. This is also confirmed by us.army.mil making the statement that shadownet has been deployed to 30 states which all

happen to be using Dominion Machines.



FAIRFAX, Va. -The Virginia National Guard's Bowling Green-based 91st Cyber Brigade completed the nationwide rollout of its ShadowNet enterprise solution July 19, 2019, with the integration of the 125th Cyber Protection Battalion into the solution's virtual private network. ShadowNet is a custom-built private cloud-based out of the brigade's data center in Fairfax, Virginia, that uses VPN connectivity to provide its aligned units with 24-hour, seven-days-a-week remote access to critical cyber training at both the collective and individual levels. The brigade successfully integrated its three other cyber protection battalions - the 123rd, 124th, and 126th Cyber Protection Battalions - into the ShadowNet platform last January.

"I'm extremely proud to announce that the Soldiers of the 91st Cyber Brigade have completed the construction and rollout of ShadowNet, a world-class enterprise solution designed to propel operational innovation in the field of cyber training," said Col. Adam C. Volant, commander of the 91st Cyber Brigade. "ShadowNet will allow us to leverage the expertise of cyber professionals across our four cyber protection battalions to build Soldier-centric programs and collective training environments that deliver

I declare under penalty of perjury that the forgoing is true and correct to the best of my knowledge. Executed this November 29th, 2020.

DECLARATION OF RONALD WATKINS

I, Ronald Watkins, hereby state the following:

1. My name is Ronald Watkins. I am a United States citizen currently residing in Japan.

2. I am an adult of sound mind. All statements in this declaration are based on my personal knowledge and are true and correct. I am making this statement voluntarily and on my own initiative. I have not been promised, nor do I expect to receive, anything in exchange for my testimony and giving this statement. I have no expectation of any profit or reward and understand that there are those who may seek to harm me for what I say in this statement.

3. I make this declaration because I want to alert the public and let the world know the truth about the insecurity of actual voting tabulation software used in various states for administering the 2020 Presidential and other elections. The software is designed, whether with malicious intent or through plain incompetence, in such a way so as to facilitate digital ballot stuffing via simple vote result manipulation and abuse of the digital adjudication manual review system. Specifically, the Dominion Democracy Suite both enables voter fraud by unethical officials out to undermine the will of the people and facilitates tabulation errors by honest officials making simple, nearly untraceable mistakes.

4. I believe voting is a fundamental manifestation of our right to self-government, including our right to free speech. Under no circumstance should we allow a conspiracy of people and companies to subvert and destroy our most sacred rights.

5. I am a network and information security expert with nine years of experience as a network and information defense analyst and a network security engineer. In my nine years of network and information security experience, I have successfully defended large websites and complex networks against powerful cyberattacks. I have engaged in extensive training and education and learned through experience how to secure websites and networks.

6. In preparation for making this declaration, I have reviewed extensive technical materials relating to the Dominion Voting Democracy Suite, including those cited herein.

7. The Dominion Voting Systems ImageCast Central system is a software and hardware workstation system designed to work with just a common "Windows 10 Pro"[12] computer

tabulates votes in real-time. Information about scanned ballots can be tracked inside the "ImageCast Central" software application.[7]

9. After all of the ballots loaded into the scanner's feed tray have been through the scanner, the "ImageCast Central" operator will remove the ballots from the tray and then will have the option to "Accept Batch" on the scanning menu.[8] Accepting the batch saves the results into the local file system within the "Windows 10 Pro" machine.[9] Any "problem ballots" that may need to be examined or adjudicated at a later time can be found as ballot scans saved as image files into a standard Windows folder named "NotCastImages".[10] These "problem ballots" are automatically detected during the scanning phase and digitally set aside for manual review based on exception criteria.[11] Examples of exceptions may include: overvotes, undervotes, blank contests, blank ballots, write-in selections, and marginal

marks."[12] Customizable outstack conditions and marginal mark detection lets [Dominion's Customers] decide which ballots are sent for Adjudication.[13]

10. During the ballot scanning process, the "ImageCast Central" software will detect how much of a percent coverage of the oval was filled in by the voter.[14] The Dominion customer determines the thresholds of which the oval needs to be covered by a mark in order to qualify as a valid vote.[1516] If a ballot has a marginal mark which did not meet the specific thresholds set by the customer, then the ballot is considered a "problem ballot" and may be set aside into a folder named "NotCastImages."[17] "The ImageCast Central's advanced

settings allow for adjustment of the scanning properties to "[set] the clarity levels at which the ballot should be scanned at." Levels can be set as a combination of brightness and contrast values, or as a gamma value."[18]

11. Based on my review of these materials, I conclude the system is designed in such a way that it allows a dishonest or otherwise unethical election administrator to creatively tweak the oval coverage threshold settings and advanced settings on the ImageCast Central scanners to set thresholds in such a way that a non-trivial amount of properly-marked ballots are marked as "problem ballots" and sent to the "NotCastImages" folder.

12. The administrator of the ImageCast Central work-station may view all images of scanned ballots which were deemed "problem ballots" by simply navigating via the standard "Windows File Explorer" to the folder named "NotCastImages" which holds ballot scans of "problem ballots."[1920] Under this system, it is possible for an administrator of the "ImageCast Central" workstation to view and delete any individual ballot scans from the "NotCastImages" folder by simply using the standard Windows delete and recycle bin functions provided by the Windows 10 Pro operating system. Adjudication is "the process of examining voted ballots to determine, and, in the judicial sense, adjudicate voter intent."[21]

[20] Calhoun County, MI, ImageCast Central (ICC) 5.5 Operations, p27, [online document], https://cms5.revize.com/revize/calhouncountymi/Clerk%20&%20Register%20of%20Deeds/local%20clerk%20resources/5_5_icc_operations_manual.pdf (accessed November 23, 2020), https://web.archive.org/web/20200802003507/https://cms5.revize.com/revize/calhouncountymi/Clerk%20&%20Register%20of%20Deeds/local%20clerk%20resources/5_5_icc_operations_manual.pdf [archive].

[21] Dominion Voting, Democracy Suite® Use Procedures, p9, [online document] https://votingsystems.cdn.sos.ca.gov/vendors/dominion/ds510-use-proc-jan.pdf (Accessed November 23, 2020),

13. Based on my review of these materials, I conclude that a biased poll worker without sufficient and honest oversight could abuse the adjudication system to fraudulently switch votes for a specific candidate.

14. After the tabulation process, the ImageCast Central software saves a copy of the tabulation results locally to the "Windows 10 Pro" machine's internal storage. The results data is located in an easy-to-find path which is designed to easily facilitate the uploading of tabulation results to flash memory cards. The upload process is just a simple copying of a "Results" folder containing vote tallies to a flash memory card connected to the "Windows 10 Pro" machine. The copy process uses the standard drag-and-drop or copy/paste mechanisms within "Windows File Explorer."[22] It is my conclusion that while this is a simple procedure, the report results process is subject to user errors and is very vulnerable to corrupt manipulation by a malicious administrator. It is my conclusion that, before delivering final tabulation results to the county, it is possible for an administrator to mistakenly copy the wrong "Results" folder or even maliciously copy a false "Results" folder, which could contain a manipulated data set, to the flash memory card and deliver those false "Results" as the outcome of the election.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed in Japan on November 24, 2020.

Congress of the United States

Washington, DC 20515

October 6, 2006

Henry M. Paulson, Jr.
Secretary
Department of the Treasury
1500 Pennsylvania Ave., N.W.
Washington, D.C. 20220

Dear Mr. Secretary:

I am writing to follow up on my letter of May 4, 2006, to Secretary Snow, seeking review by the Committee on Foreign Investment in the United States of the acquisition of Sequoia Voting Systems by Smartmatic, a foreign-owned company. I believe this transaction raises exactly the sort of foreign ownership issues that CFIUS is best positioned to examine for national security concerns. As discussed below, publicly reported information about Smartmatic's ownership and about the vulnerability of electronic voting machines to tampering raises serious concerns. I strongly urge CFIUS to independently verify the information provided to American officials and the public by Sequoia/Smartmatic, and to take all appropriate measures to safeguard our national security.

It is undisputed that Smartmatic is foreign-owned and it has acquired Sequoia, one of the three major voting machine companies doing business in the U.S. According to a Sequoia press release in May 2006 (copy attached) Sequoia voting machines were used to record over 125 million votes during the 2004 Presidential election in the United States. As we confront another election, Americans deserve to know that the Administration has made sure that any foreign ownership of voting machines poses no national security threat.

Although many press reports have tried, it appears that it is not possible to discern the true owners of Smartmatic from information available to the public. Smartmatic now acknowledges that Antonio Mugica, a Venezuelan businessman, has a controlling interest in Smartmatic, but the company has not revealed who all the other Smartmatic owners are. According to the press, Smartmatic's owners are hidden through a web of off-shore private entities. (See attached articles.)

The opaque nature of Smartmatic's ownership is particularly troubling since Smartmatic has been associated by the press with the Venezuelan government led by Hugo Chavez, which is openly hostile to the United States. According to press reports, Smartmatic shared a founder, officers, directors and a principal place of business with Bizta, a company in which, according to Smartmatic, the Venezuelan government previously held a 28% stake. Mugica is also a director of Bizta.

According to Smartmatic press releases, (copies attached) Smartmatic and Bizta were part of the consortium that received the government contract to provide the voting machines for the 2004 referendum election to recall Chavez as Venezuela's president, and have since been awarded other contracts by the Venezuelan government.

Smartmatic's possible connection to the Venezuelan government poses a potential national security concern in the context of its acquisition of Sequoia because electronic voting machines are susceptible to tampering and insiders are in the best position to engage in such tampering. The 2005 Government Accountability Office Report on electronic voting, GAO-05-956, and other private sector studies consistently support this conclusion. Thus, the reports that Sequoia brought Venezuelan nationals to the United States to work on the Chicago 2006 primary election raises questions about whether these individuals are subject to direction from a foreign interest that might pose a threat to the integrity of the election. Similarly, the use of Smartmatic software and machines developed in Venezuela, such as the HAAT software that was at issue in Chicago, raises questions as to whether this software is susceptible to manipulation by its unknown creators. Reportedly, Smartmatic may soon be introducing into the United States the type of electronic voting machines that were used (with Bizta software) in the controversial 2004 Venezuelan recall election, under the label AVC Edge II Plus.

In reviewing the Smartmatic acquisition of Sequoia, it is important that CFIUS understand the products and services that are of Venezuelan origin and evaluate Smartmatic's ownership to determine who could have influence and control over these and other Sequoia products and services that are in use or intended for use in U.S. elections. In light of Smartmatic's failure fully to answer these questions to date, this issue demands the most thorough independent investigation by CFIUS.

Thank you for your consideration of this letter.

Sincerely,

Carolyn B. Maloney

Carolyn B. Maloney
Member of Congress

Congress of the United States

Washington, DC 20510

December 6, 2019

Sami Mnaymneh
Founder and Co-Chief Executive Officer
H.I.G. Capital, LLC
[redacted]

Tony Tamer
Founder and Co-Chief Executive Officer
H.I.G. Capital, LLC
[redacted]

Dear Messrs. Mnaymneh and Tamer:

We are writing to request information regarding H.I.G. Capital's (H.I.G.) investment in Hart InterCivic Inc. (Hart InterCivic) one of three election technology vendors responsible for developing, manufacturing and maintaining the vast majority of voting machines and software in the United States, and to request information about your firm's structure and finances as it relates to this company.

Some private equity funds operate under a model where they purchase controlling interests in companies and implement drastic cost-cutting measures at the expense of consumers, workers, communities, and taxpayers. Recent examples include Toys "R" Us and Shopko.[1] For that reason, we have concerns about the spread and effect of private equity investment in many sectors of the economy, including the election technology industry—an integral part of our nation's democratic process. We are particularly concerned that secretive and "trouble-plagued companies,"[2] owned by private equity firms and responsible for manufacturing and maintaining voting machines and other election administration equipment, "have long skimped on security in favor of convenience," leaving voting systems across the country "prone to security problems."[3] In light of these concerns, we request that you provide information about your firm, the portfolio

[2] ProPublica, "The Market for Voting Machines Is Broken. This Company Has Thrived in It.," Jessica Huseman, October 28, 2019, https://www.propublica.org/article/the-market-for-voting-machines-is-broken-this-company-has-thrived-in-it.

[3] Associated Press News, "US Election Integrity Depends on Security-Challenged Firms," Frank Bajak, October 28, 2019, https://apnews.com/f6876669cb6b4e4c9850844f8e015b4c.

companies in which it has invested, the performance of those investments, and the ownership and financial structure of your funds.

Over the last two decades, the election technology industry has become highly concentrated, with a handful of consolidated vendors controlling the vast majority of the market. In the early 2000s, almost twenty vendors competed in the election technology market.[4] Today, three large vendors—Election Systems & Software, Dominion Voting Systems, and Hart InterCivic—collectively provide voting machines and software that facilitate voting for over 90% of all eligible voters in the United States.[5] Private equity firms reportedly own or control each of these vendors, with very limited "information available in the public domain about their operations and financial performance."[6] While experts estimate that the total revenue for election technology vendors is about $300 million, there is no publicly available information on how much those vendors dedicate to research and development, maintenance of voting systems, or profits and executive compensation.[7]

Concentration in the election technology market and the fact that vendors are often "more seasoned in voting machine and technical services contract negotiations" than local election officials, give these companies incredible power in their negotiations with local and state governments. As a result, jurisdictions are often caught in expensive agreements in which the same vendor both sells or leases, and repairs and maintains voting systems–leaving local officials dependent on the vendor, and the vendor with little incentive to substantially overhaul and improve its products.[8] In fact, the Election Assistance Commission (EAC), the primary federal body responsible for developing voluntary guidance on voting technology standards, advises state and local officials to consider "the cost to purchase or lease, operate, and maintain a voting system over its life span … [and to] know how the vendor(s) plan to be profitable" when signing contracts, because vendors typically make their profits by ensuring "that they will be around to maintain it after the sale." The EAC has warned election officials that "[i]f you do not manage the vendors, they will manage you."[9]

Election security experts have noted for years that our nation's election systems and infrastructure are under serious threat. In January 2017, the U.S. Department of Homeland Security designated the United States' election infrastructure as "critical infrastructure" in order to prioritize the protection of our elections and to more effectively assist state and local election

officials in addressing these risks.[10] However, voting machines are reportedly falling apart across the country, as vendors neglect to innovate and improve important voting systems, putting our elections at avoidable and increased risk.[11] In 2015, election officials in at least 31 states, representing approximately 40 million registered voters, reported that their voting machines needed to be updated, with almost every state "using some machines that are no longer manufactured."[12] Moreover, even when state and local officials work on replacing antiquated machines, many continue to "run on old software that will soon be outdated and more vulnerable to hackers."[13]

In 2018 alone "voters in South Carolina [were] reporting machines that switched their votes after they'd inputted them, scanners [were] rejecting paper ballots in Missouri, and busted machines [were] causing long lines in Indiana."[14] In addition, researchers recently uncovered previously undisclosed vulnerabilities in "nearly three dozen backend election systems in 10 states."[15] And, just this year, after the Democratic candidate's electronic tally showed he received an improbable 164 votes out of 55,000 cast in a Pennsylvania state judicial election in 2019, the county's Republican Chairwoman said, "[n]othing went right on Election Day. Everything went wrong. That's a problem."[16] These problems threaten the integrity of our elections and demonstrate the importance of election systems that are strong, durable, and not vulnerable to attack.

H.I.G. reportedly owns or has had investments in Hart InterCivic, a major election technology vendor. In order to help us understand your firm's role in this sector, we ask that you provide answers to the following questions no later than December 20, 2019.

1. Please provide the disclosure documents and information enumerated in Sections 501 and 503 of the *Stop Wall Street Looting Act*.[17]

2. Which election technology companies, including all affiliates or related entities, does H.I.G. have a stake in or own? Please provide the name of and a brief description of the services each company provides.

Michael McCarthy
Chairman
McCarthy Group, LLC
[redacted]

Dear Mr. McCarthy:

We are writing to request information regarding McCarthy Group, LLC's (McCarthy Group) investment in Election Systems & Software (ES&S), one of three election technology vendors responsible for developing, manufacturing and maintaining the vast majority of voting machines and software in the United States, and to request information about your firm's structure and finances as it relates to this company.

Some private equity funds operate under a model where they purchase controlling interests in companies and implement drastic cost-cutting measures at the expense of consumers, workers, communities, and taxpayers. Recent examples include Toys "R" Us and Shopko.[1] For that reason, we have concerns about the spread and effect of private equity investment in many sectors of the economy, including the election technology industry—an integral part of our nation's democratic process. We are particularly concerned that secretive and "trouble-plagued companies,"[2] owned by private equity firms and responsible for manufacturing and maintaining voting machines and other election administration equipment, "have long skimped on security in favor of convenience," leaving voting systems across the country "prone to security problems."[3] In light of these concerns, we request that you provide information about your firm, the portfolio companies in which it has invested, the performance of those investments, and the ownership and financial structure of your funds.

Over the last two decades, the election technology industry has become highly concentrated, with a handful of consolidated vendors controlling the vast majority of the market. In the early

a. Which election technology companies, including all affiliates or related entities, has Staple Street had a stake in or owned in the past twenty years? Please provide the name of and a brief description of the services each company provides or provided.

b. For each election technology company Staple Street had a stake in or owned in the past twenty years, including all affiliates or related entities, please provide the following information for each year that the firm has had a stake in or owned this company and the five years preceding the firm's investment.
   i. The name of the company
   ii. Ownership stake
   iii. Total revenue
   iv. Net income
   v. Percentage of revenue dedicated to research and development
   vi. Total number of employees
   vii. A list of all state and local jurisdictions with which the company has a contract to provide election related products or services
   viii. Other private-equity firms that own a stake in the company

3. Has any election technology company, including all affiliates or related entities, in which Staple Street has an ownership stake or has had an ownership stake in the last twenty years, been found to have been in noncompliance with the EAC's Voluntary Voting System Guidelines? If so, please provide a copy of each EAC noncompliance notice received by the company and a description of what steps the company took to resolve each issue.

4. Has any election technology company, including all affiliates or related entities, in which Staple Street has an ownership stake or has had an ownership stake in the last twenty years, been found to have been in noncompliance with any state or local voting system guidelines or practices? If so, please provide a list of all such instances and a description of what steps the company took to resolve each issue.

5. Has any election technology company, including all affiliates or related entities, in which Staple Street has an ownership stake or has had an ownership stake in the last twenty years, been found to have violated any federal or state laws or regulations? If so, please provide a complete list, including the date and description, of all such violations.

6. Has any election technology company, including all affiliates or related entities, in which Staple Street has an ownership stake or has had an ownership stake in the last twenty years, reached a settlement with any federal or state law enforcement entity related to a potential violation of any federal or state laws or regulations? If so, please provide a complete list, including the date and description, of all such settlements.

7. Has any election technology company, including all affiliates or related entities, in which Staple Street has an ownership stake or has had an ownership stake in the past twenty years, reached a settlement with any state or local jurisdiction related to a potential violation of or breach of contract? If so, please provide a complete list, including the date and description, of all such settlements.

Thank you for your attention to this matter.

Sincerely,

Elizabeth Warren
United States Senator

Amy Klobuchar
United States Senator

Ron Wyden
United States Senator

Mark Pocan
Member of Congress

Declaration of Russell James Ramsland, Jr.

1. My name is Russell James Ramsland, Jr., and I am a resident of Dallas County, Texas. I make this declaration pursuant to 28 USC sec 1746. I am over 18 years of age. I hold an MBA from Harvard University, and a political science degree from Duke University. I have worked with the National Aeronautics and Space Administration (NASA) and the Massachusetts Institute of Technology (MIT), among other organizations, and have run businesses all over the world, many of which are highly technical in nature. I have served on technical government panels.

2. I am part of the management team of Allied Security Operations Group, LLC, (ASOG). ASOG is a group of globally engaged professionals who come from various disciplines to include Department of Defense, Secret Service, Department of Homeland Security, and the Central Intelligence Agency. It provides a range of security services, but has a particular emphasis on cybersecurity, open source investigation and penetration testing of networks. We employ a wide variety of cyber and cyber forensic analysts. We have patents pending in a variety of applications from novel network security applications to SCADA (Supervisory Control and Data Acquisition) protection and safe browsing solutions for the dark and deep web. For this report, I have relied on these experts and resources.

3. In November 2018, ASOG analyzed audit logs for the central tabulation server of the ES&S Election Management System (EMS) for the Dallas, Texas, General Election of 2018. Our team was surprised at the enormous number of error messages that should not have been there. They numbered in the thousands, and the operator ignored and overrode all of them. This led to various legal challenges in that election, and we provided evidence and analysis in some of them.

4. As a result, ASOG initiated an 18-month study into the major EMS providers in the United States, among which is Election Systems and Software ("ES&S") that provides EMS services for Wisconsin. We did thorough background research of the literature and discovered there is confirmed evidence from both Democrat and Republican stakeholders in the vulnerability of ES&S. Next, we began doing passive penetration testing into the vulnerabilities described in the literature and confirmed for ourselves that in many cases, past vulnerabilities already identified were still left open to exploit in the November 2020 elections. We also noticed a striking similarity between the approach to software and EMS systems of ES&S and Dominion. This was logical since they share a common ancestry in the Diebold voting system.

5. Over the past three decades, almost all of the states have shifted from a relatively low-technology format to a high-technology format that relies heavily on a handful of private services companies. These private companies supply the hardware and software, often handle voter registrations, hold the voter records, partially manage the elections, program counting the votes and report the outcomes. Wisconsin is one of those states.

6. These systems contain a large number of known vulnerabilities to hacking and tampering, both when voters express their voting intention by marking an electronic ballot using ballot marking devices (BMDs), and at the back end where the votes are stored, tabulated, and reported by election officials. These vulnerabilities are well known, and experts in the field have written extensively about them.. This is not surprising as there are no federal standards for security in voting system software. EAC 2.0 was to be written to address this issue, but was never done.

7. Below is a screenshot from the ES&S Security Test Report Electionware 5.2.1.0 – 8/28/17 – Freeman, Craft, McGregor Group. It shows an incredible number of vulnerabilities in the system by which inside and external threats can manipulate the outcomes in a variety of ways.

Recently ES&S moved many of its systems into the cloud behind cloudfare, but ASOG determined that this protection can still be easily circumvented by gaining access through its FTP site ESSVotes.

7. Election Systems and Software ("ES&S") is a privately held company that provides election technologies and services to government jurisdictions. Almost all the counties of Wisconsin use the ES&S Election Management System with the exception of Sheboygan County. ES&S systems have options to be an electronic, paperless voting system with no permanent record of the voter's choices, or a paper ballot-based system or hybrid of those two.

9. The overwhelming vulnerabilities of the ES&S system were on full display in Dallas County where ES&S is used, during the 2020 General Election. Data has been provided by the Dallas County Election Department. The Voter Registration Database was received October 13, 2020 following an Open Records Request by The Dallas Examiner. The Mail-In and Early Voting Rosters were downloaded daily from the County's computers. All Texas counties are required by law to publish daily voting rosters.

10. In that election, the voter records during early voting were captured each day for those voters who cast ballots either in person or by mail-in and catalogued using the hash totals to provide an absolute unique identifier. As required by state law, the Dallas County Elections Department published the Daily Vote Roster for all voters who cast ballots during Absentee and In-Person Early Voting. The Roster contained the VoterID, name, address, type of vote, and various dates associated with every Early-Voting vote cast.

Dallas County claims its source of roster data was the In-Person Electronic Poll Books, and the Absentee Ballot scanners. Dallas County has claimed that entry into the Vote Roster can only be done by a registered Dallas County voter who either appeared In-Person or by Absentee Ballot. The computer that generated the roster was apparently hacked between October 7 and October 30. During that period tens of thousands of vote records were purged, added, or edited from the ES&S generated Vote Roster.

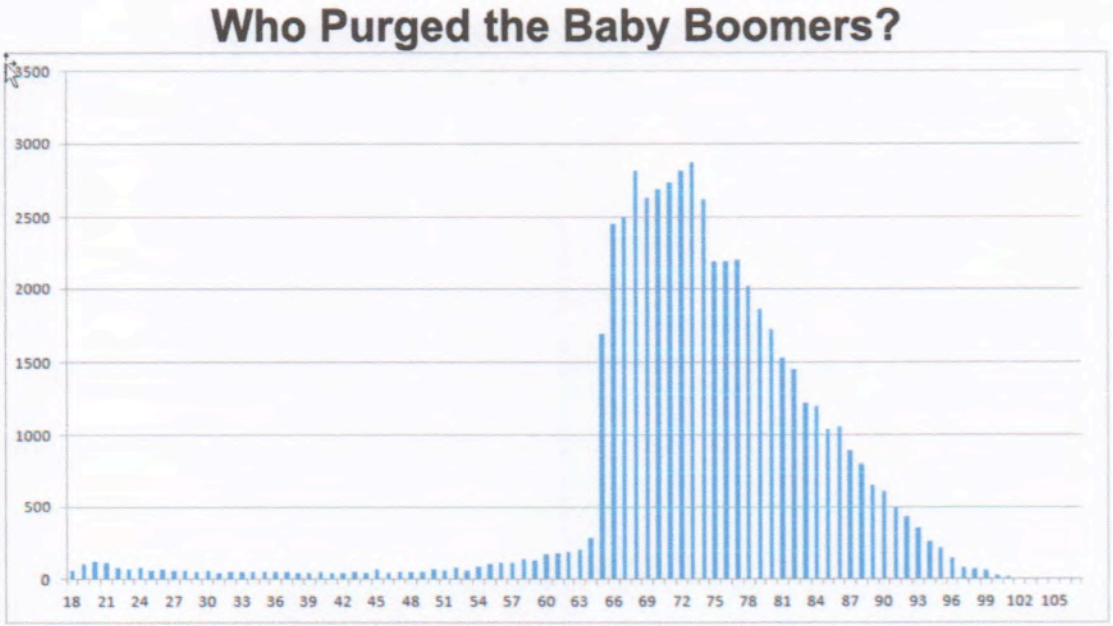
Specifically, over this period, 56,974 voter records had their hash identifier changed, meaning the vote was tampered with after it was cast and recorded in the system. In most cases, this tampering took the form of purging the vote, and then re-constituting it in some form or fashion, but with a change in the hash total meaning the vote was somehow changed. Currently it appears 5,690 votes disappeared completely after voting in person. All in all, this translates into approximately 107,000 hacked votes in Dallas County alone for ES&S. Ten blocks of voters on Westminster Street in Highland Park had their votes purged and then some of them were selectively re-instated at a later date with changes. People who double voted were catalogued as well as dead people who voted, people with no VUID voted (approximately 800 of them), unregistered university students voted, and *people living abroad who claim a Dallas Residence for voting purposes, but who, in a spot check are unknown to the residences they list* in the ES&S system. A short list of them includes:

Country	Voters Who Voted
Mexico	118
Guatemala	9
Nicaragua	4
Kenya	18
Canada	154
Ireland	34
China	62
Australia	105

In plain English, at the instant before a voter casts a ballot there is a one-to-one relationship between the voter and their ballot as well as a one-to-one association between the voter and their votes.

At the instant that ballot is cast, the one-to-one relationship between the voter and ballot still exist, but the relationship between the voter and their votes is gone. No one can know how they voted. The key security check on voting integrity is the absolute match between the number of voters in the Vote Roster and the number of ballots counted in that voting district or precinct. If these numbers do not match, either physical ballots were added or removed from the Ballot Counter or "voters" were added or removed from the Vote Roster. In either case, the election has been compromised and the election is nothing more than a lottery. With tens of thousands of Vote Roster entries purged and other tens of thousand of entries apparently created out of thin air, using the ES&S EMS system, Dallas County Elections Department is definitely in the lottery business.

11. Equally troubling with the ES&S System is the apparent ease of targeting within the system of certain groups for purging. In Dallas, over 92% of PURGED In-Person and Absentee voters were over 65. This is statistically impossible and makes clear the system is easily manipulated by inside or outside actors.



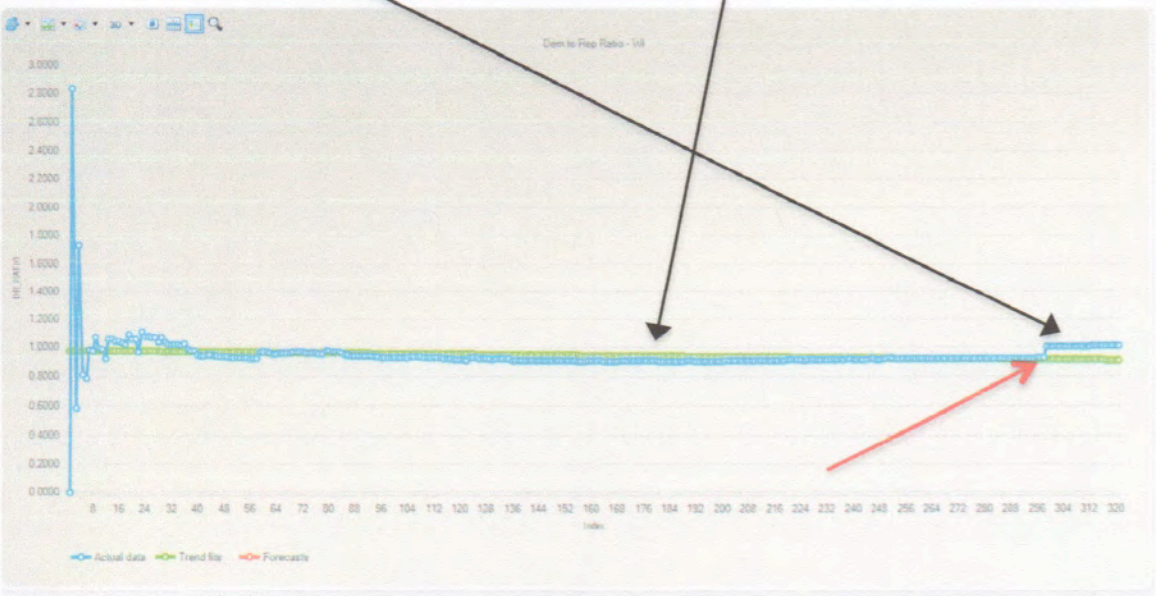
Purged Voters by Age *Source: Dallas County Election Department Vote Rosters Oct 7-Oct 30*

12. My colleagues and I at ASOG have studied the information that is publicly available concerning the November 3, 2020, election results from Wisconsin. Based on the significant anomalies and red flags that we have observed, I believe to a reasonable degree of professional certainty that election results have been

manipulated within the ES&S system in Wisconsin. We list below a few of the red flags that our team has uncovered.

13. Where ES&S is concerned, a statistically unlikely event (red arrow) occurred in the Wisconsin General Election at 09:42:30 Z (3:42 AM local) on 11/4/2020 according to Edison data reported to the NYT. For this analysis we focused on the key ratio of the cumulative Democrat (Biden) votes divided by the cumulative Republican (Trump) votes.

1. A ratio greater than 1.00 is an indicator of Democrat victory
2. A ratio less than 1.00 is an indicator of Republican victory
3. The time series plot shows the trend over time of the cumulative votes.
4. The trend analysis shows the time series but adds a statistically estimated trend line (in green)
5. Where anomalies are observed, the record is pulled out and a proportion test included that tests the probability that that batch of votes was drawn at random from the population of that state, based on the final counts.
6. Randomization is a reasonable assumption because the mail system acts as a randomizer as it mixes the ballots, and the later votes are the mail ballots.
7. The event outline below shifted what had been a settled, unarguable D/R ratio (cumulative to this point) of .912. Suddenly, this event occurs and is of such magnitude it shifts the entire election ratio to 1.0123.



Preview Record

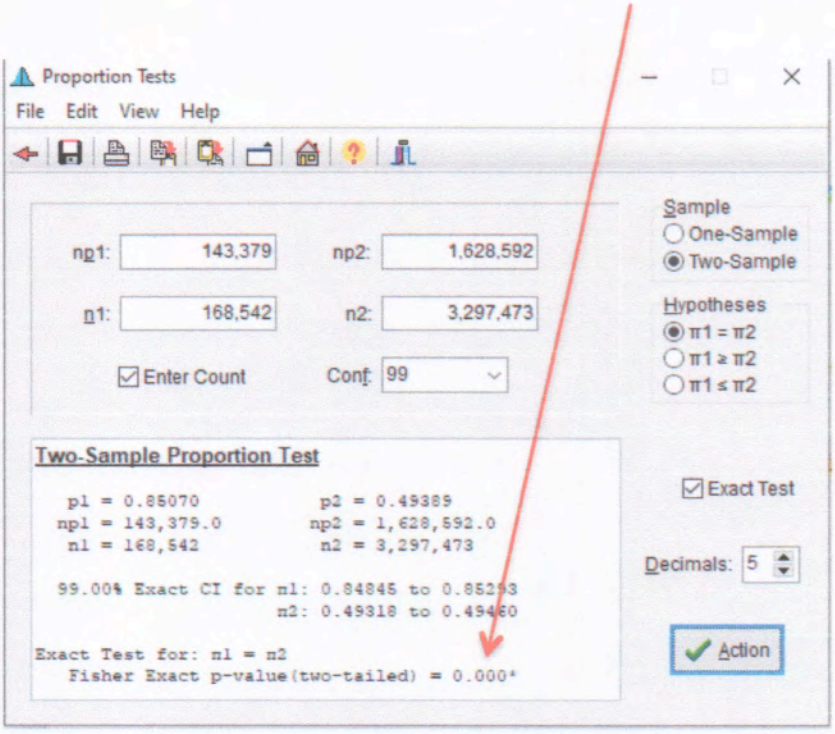
Preview Record

	RECNUM	STATE	TIMESTAMP	VOTES	EEVP	TRUMPD	BIDENJ	TRUMP_CUM	BIDEN_CUM	DATE	TIME	DR_RATIO	D_VOTES	R_VOTES	LOG_D	LOG_R
1	8721	wisconsin	2020-11-04T09:42:20Z	3186598	89	0.490	0.493	1561433	1570993	2020-11-04	09:42:20	1.0061	143379	25163	5.1565	4.4008

P-Test (two-sample proportion test) shows that there is a 0.0% probability that this vote drop came from a random population of Wisconsin votes as shown in the outcome screenshot below. As shown above, Biden suddenly gets 143,379 votes out of 168,542 or 85%, which itself is outside any percentage before or after.



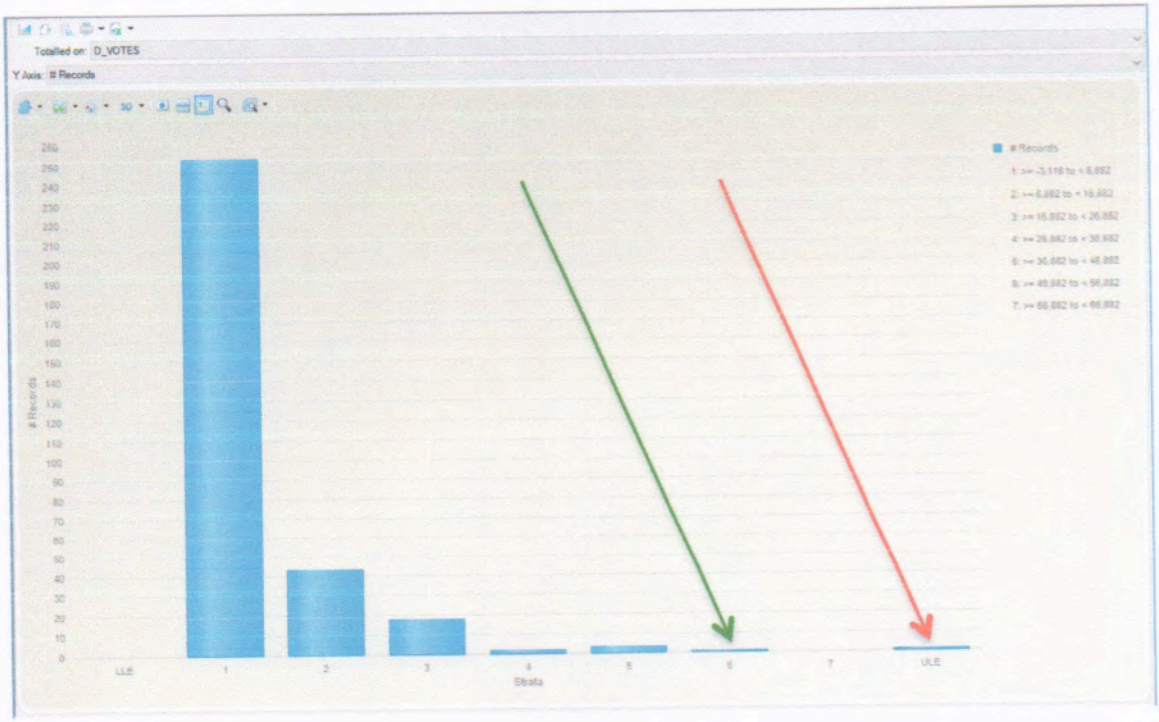
This event changed the final outcome. If this statistically impossible event were removed, the final outcome would be:

Biden:	1,485,573
Trump:	1,584,004

This reveals a shift of approximately 119,430 votes from Biden to Trump would be expected were the election not tampered with.

14. A further red flag is raised when an analysis is done by voting batch. Here we can clearly see the magnitude of the Wisconsin batch dropped at 09:42:30Z on 11/4/2020 vastly exceeds every other Democrat vote total.

This batch shows up as an upper limit exception, meaning it is outside the realm of any expected outcome. A stratification bar chart (below) will indicate visually where the probabilities lie relevant to this event. At 6 standard deviations the chart shows very little chance of this occurring (green arrow). However, in this case, the event occurs at 12.93 standard deviations from the mean (red arrow), showing the probability even smaller at less than 3 in 1,000. Any fraud examiner would instantly flag this for a fraud audit and our Internal Auditor contractor did so immediately.



All of these are clear indications of fraud.

15. Another key red flag appears after inspecting voter turnout figures by county. Out of 72 counties, 69 of them exhibited voter turnout figures higher than 80%, a threshold generally considered to be the maximum expected. An amazing 59 of them were above 90%. When the public data votes were normalized to 80% turnout, the excess votes are at least 384,085 over the maximum that could be expected. A sample of this is shown in the table below.

County	Turnout %
Sheboygan County	270%
Shawano County	195%
Taylor County	95%
Marquette County	95%
Price County	94%

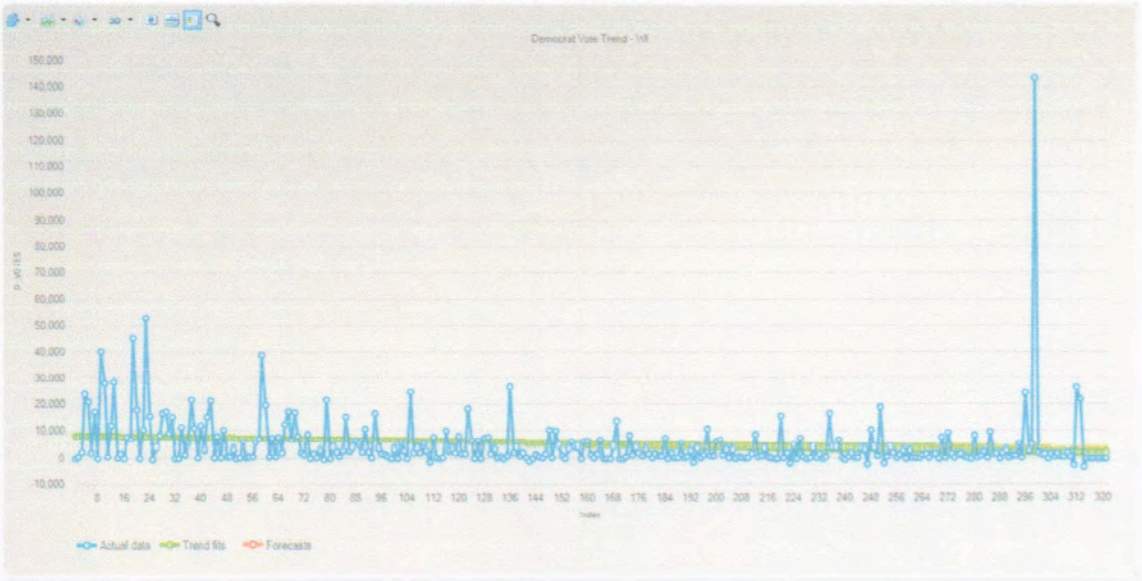
15. Returning to the spike chart presented earlier, a time series crossed with a location specific analysis would determine whether the equipment on hand at any location would have even been capable of processing this many votes in the time represented. In Michigan, we have already observed this phenomenon and the analysis made clear it was physically impossible for the equipment on hand to process this many votes in the time represented.

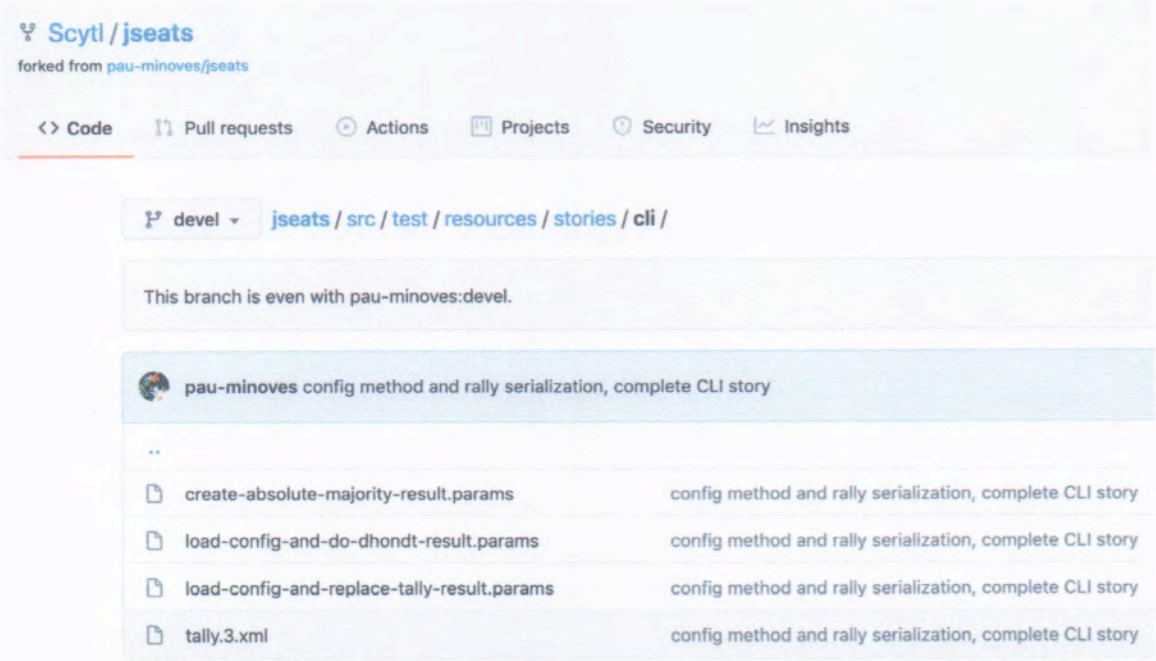


Preview Record

	RECNUM	STATE	TIMESTAMP	VOTES	EEVP	TRUMPD	BIDENJ	TRUMP_CUM	BIDEN_CUM	DATE	TIME	DR_RATIO	D_VOTES	R_VOTES	LOG_D	LOG_R
1	8721	wisconsin	2020-11-04T09:42:20Z	3186598	89	0.490	0.493	1561433	1570993	2020-11-04	09:42:20	1.0061	143379	25163	5.1565	4.4008

This spike, cast largely for Biden, (143,379-Biden, 25,163-Trump) could easily be produced in the ES&S EMS control system by pre-loading batches of blank ballots in files such as Write-Ins or other adjudication-type files then casting them almost all for Biden using the Override Procedure (to cast Write-In, Blank, or Error ballots) that is available to the operator of the system.

16. ES&S uses Scytl via Clarity Elections to accomplish the actual tabulation. Scytl has in its source code the ability to use a common, additive electoral seat allocation algorithm (JSeats) in order to award points based on percentages that are input into the system by the operator in order to determine (or appoint) a winner, as opposed to simply counting votes. Various parameters, weighting percentages, etc. can be set up. Thus, the winner is selected based on "points" that the algorithm computes, not actual voter votes. Below is a screenshot



The fact that we observed raw vote data coming directly that includes decimal places establishes selection by an algorithm, and not individual voter's choice. Otherwise, votes would be solely represented as whole numbers (votes cannot possibly be added up and have decimal places reported). Below is an excerpt from the direct feed to news outlets showing actual calculated votes with decimals.

state	timestamp	eevp	trump	biden	TV	BV
wisconsin	2020-11-04T03:22:01Z	32	0.511	0.472	593876.535	548551.32

wisconsin	2020-11-04T03:27:32Z	34	0.5	0.483	615621.5	594690.369

wisconsin	2020-11-04T03:28:57Z	35	0.5	0.483	635870.5	614250.903
wisconsin	2020-11-04T03:30:09Z	35	0.5	0.483	636620.5	614975.403
wisconsin	2020-11-04T03:30:28Z	36	0.502	0.481	649562.9	622389.95
wisconsin	2020-11-04T03:30:52Z	36	0.503	0.481	651861.844	623350.988
wisconsin	2020-11-04T03:35:25Z	37	0.503	0.48	661114.026	630884.16

14. Based on the foregoing, I believe these statistical anomalies and impossibilities compels the conclusion to a reasonable degree of professional certainty that the vote count in Wisconsin, in particular for candidates for President, contain at least 119,430 (Para. 13) up to 384,085 (Para. 15) illegal votes that must be disregarded. In my opinion, it is not possible at this time to determine the true results of the Wisconsin vote for President of the United States.

I declare, under the penalty of perjury, that the forgoing is correct.

Russell James Ramsland, Jr.

JOINT
CYBERSECURITY
ADVISORY

TLP:WHITE

Product ID: AA20-304A

October 30, 2020

Iranian Advanced Persistent Threat Actor Identified Obtaining Voter Registration Data

SUMMARY

This advisory uses the MITRE Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK®) framework. See the ATT&CK for Enterprise framework for all referenced threat actor techniques.

This joint cybersecurity advisory was coauthored by the Cybersecurity and Infrastructure Security Agency (CISA) and the Federal Bureau of Investigation (FBI). CISA and the FBI are aware of an Iranian advanced persistent threat (APT) actor targeting U.S. state websites—to include election websites. CISA and the FBI assess this actor is responsible for the mass dissemination of voter intimidation emails to U.S. citizens and the dissemination of U.S. election-related disinformation in mid-October 2020.[1] (Reference FBI FLASH message ME-000138-TT, disseminated October 29, 2020). Further evaluation by CISA and the FBI has identified the targeting of U.S. state election websites was an intentional effort to influence and interfere with the 2020 U.S. presidential election.

TECHNICAL DETAILS

Analysis by CISA and the FBI indicates this actor scanned state websites, to include state election websites, between September 20 and September 28, 2020, with the Acunetix vulnerability scanner (*Active Scanning: Vulnerability Scanning* [T1595.002]). Acunetix is a widely used and legitimate web scanner, which has been used by threat actors for nefarious purposes. Organizations that do not regularly use Acunetix should monitor their logs for any activity from the program that originates from IP addresses provided in this advisory and consider it malicious reconnaissance behavior.

Additionally, CISA and the FBI observed this actor attempting to exploit websites to obtain copies of voter registration data between September 29 and October 17, 2020 (*Exploit Public-Facing*

[1] See FBI FLASH, ME-000138-TT, disseminated 10/29/20, https://www.ic3.gov/Media/News/2020/201030.pdf. This disinformation (hereinafter, "the propaganda video") was in the form of a video purporting to misattribute the activity to a U.S. domestic actor and implies that individuals could cast fraudulent ballots, even from overseas. https://www.odni.gov/index.php/newsroom/press-releases/item/2162-dni-john-ratcliffe-s-remarks-at-press-conference-on-election-security.

Exhibit 18

Application [T1190]). This includes attempted exploitation of known vulnerabilities, directory traversal, Structured Query Language (SQL) injection, web shell uploads, and leveraging unique flaws in websites.

CISA and the FBI can confirm that the actor successfully obtained voter registration data in at least one state. The access of voter registration data appeared to involve the abuse of website misconfigurations and a scripted process using the cURL tool to iterate through voter records. A review of the records that were copied and obtained reveals the information was used in the propaganda video.

CISA and FBI analysis of identified activity against state websites, including state election websites, referenced in this product cannot all be fully attributed to this Iranian APT actor. FBI analysis of the Iranian APT actor's activity has identified targeting of U.S. elections' infrastructure (*Compromise Infrastructure* [T1584]) within a similar timeframe, use of IP addresses and IP ranges – including numerous virtual private network (VPN) service exit nodes – which correlate to this Iran APT actor (*Gather Victim Host Information* [T1592])), and other investigative information.

Reconnaissance

The FBI has information indicating this Iran-based actor attempted to access PDF documents from state voter sites using advanced open-source queries (*Search Open Websites and Domains* [T1539]). The actor demonstrated interest in PDFs hosted on URLs with the words "vote" or "voter" and "registration." The FBI identified queries of URLs for election-related sites.

The FBI also has information indicating the actor researched the following information in a suspected attempt to further their efforts to survey and exploit state election websites.

- YOURLS exploit
- Bypassing ModSecurity Web Application Firewall
- Detecting Web Application Firewalls
- SQLmap tool

Acunetix Scanning

CISA's analysis identified the scanning of multiple entities by the Acunetix Web Vulnerability scanning platform between September 20 and September 28, 2020 (*Active Scanning: Vulnerability Scanning* [T1595.002]).

The actor used the scanner to attempt SQL injection into various fields in `/registration/registration/details` with status codes 404 or 500:

```

Exfiltration

Obtaining Voter Registration Data

Following the review of web server access logs, CISA analysts, in coordination with the FBI, found instances of the cURL and FDM User Agents sending GET requests to a web resource associated with voter registration data. The activity occurred between September 29 and October 17, 2020. Suspected scripted activity submitted several hundred thousand queries iterating through voter

identification values, and retrieving results with varying levels of success [*Gather Victim Identity Information* (T1589)]. A sample of the records identified by the FBI reveals they match information in the aforementioned propaganda video.

Requests

The actor used the following requests.

```
2020-10-17 13:07:51 x.x.x.x GET /x/x voterid=XXXX1 443 - x.x.x.x curl/7.55.1 - 200 0 0 1406
```

```
2020-10-17 13:07:55 x.x.x.x GET /x/x voterid=XXXX2 443 - x.x.x.x curl/7.55.1 - 200 0 0 1390
```

```
2020-10-17 13:07:58 x.x.x.x GET /x/x voterid=XXXX3 443 - x.x.x.x curl/7.55.1 - 200 0 0 1625
```

```
2020-10-17 13:08:00 x.x.x.x GET /x/x voterid=XXXX4 443 - x.x.x.x curl/7.55.1 - 200 0 0 1390
```

Note: incrementing `voterid` values in `cs_uri_query field`

User Agents

CISA and FBI have observed the following user agents.

```
FDM+3.x
```

```
curl/7.55.1
```

```
Mozilla/5.0+(Windows+NT+6.1;+WOW64)+AppleWebKit/537.21+(KHTML,+like+Gecko)+Chrome/41.0.2228.0+Safari/537.21 - 500 0 0 0
Mozilla/5.0+(X11;+U;+Linux+x86_64;+en-US;+rv:1.9b4)+Gecko/2008031318+Firefox/3.0b4
```

See figure 1 below for a timeline of the actor's malicious activity.

Recommendations

The following list provides recommended self-protection mitigation strategies against cyber techniques used by advanced persistent threat actors:

- Validate input as a method of sanitizing untrusted input submitted by web application users. Validating input can significantly reduce the probability of successful exploitation by providing

Exhibit 18

protection against security flaws in web applications. The types of attacks possibly prevented include SQL injection, Cross Site Scripting (XSS), and command injection.

- Audit your network for systems using Remote Desktop Protocol (RDP) and other internet-facing services. Disable unnecessary services and install available patches for the services in use. Users may need to work with their technology vendors to confirm that patches will not affect system processes.
- Verify all cloud-based virtual machine instances with a public IP, and avoid using open RDP ports, unless there is a valid need. Place any system with an open RDP port behind a firewall and require users to use a VPN to access it through the firewall.
- Enable strong password requirements and account lockout policies to defend against brute-force attacks.
- Apply multi-factor authentication, when possible.
- Maintain a good information back-up strategy by routinely backing up all critical data and system configuration information on a separate device. Store the backups offline, verify their integrity, and verify the restoration process.
- Enable logging and ensure logging mechanisms capture RDP logins. Keep logs for a minimum of 90 days and review them regularly to detect intrusion attempts.
- When creating cloud-based virtual machines, adhere to the cloud provider's best practices for remote access.
- Ensure third parties that require RDP access follow internal remote access policies.
- Minimize network exposure for all control system devices. Where possible, critical devices should not have RDP enabled.
- Regulate and limit external to internal RDP connections. When external access to internal resources is required, use secure methods, such as a VPNs. However, recognize the security of VPNs matches the security of the connected devices.
- Use security features provided by social media platforms; use strong passwords, change passwords frequently, and use a different password for each social media account.
- See CISA's Tip on Best Practices for Securing Election Systems for more information.

General Mitigations

Keep applications and systems updated and patched

Apply all available software updates and patches and automate this process to the greatest extent possible (e.g., by using an update service provided directly from the vendor). Automating updates and patches is critical because of the speed of threat actors to create new exploits following the release of a patch. These "N-day" exploits can be as damaging as zero-day exploits. Ensure the authenticity and integrity of vendor updates by using signed updates delivered over protected links. Without the rapid and thorough application of patches, threat actors can operate inside a defender's patch cycle.[2]

Exhibit 18

Additionally, use tools (e.g., the OWASP Dependency-Check Project tool[3]) to identify the publicly known vulnerabilities in third-party libraries depended upon by the application.

Scan web applications for SQL injection and other common web vulnerabilities

Implement a plan to scan public-facing web servers for common web vulnerabilities (e.g., SQL injection, cross-site scripting) by using a commercial web application vulnerability scanner in combination with a source code scanner.[4] Fixing or patching vulnerabilities after they are identified is especially crucial for networks hosting older web applications. As sites get older, more vulnerabilities are discovered and exposed.

Deploy a web application firewall

Deploy a web application firewall (WAF) to prevent invalid input attacks and other attacks destined for the web application. WAFs are intrusion/detection/prevention devices that inspect each web request made to and from the web application to determine if the request is malicious. Some WAFs install on the host system and others are dedicated devices that sit in front of the web application. WAFs also weaken the effectiveness of automated web vulnerability scanning tools.

Deploy techniques to protect against web shells

Patch web application vulnerabilities or fix configuration weaknesses that allow web shell attacks, and follow guidance on detecting and preventing web shell malware.[5] Malicious cyber actors often deploy web shells—software that can enable remote administration—on a victim's web server. Malicious cyber actors can use web shells to execute arbitrary system commands commonly sent over HTTP or HTTPS. Attackers often create web shells by adding or modifying a file in an existing web application. Web shells provide attackers with persistent access to a compromised network using communications channels disguised to blend in with legitimate traffic. Web shell malware is a long-standing, pervasive threat that continues to evade many security tools.

Use multi-factor authentication for administrator accounts

Prioritize protection for accounts with elevated privileges, remote access, or used on high-value assets.[6] Use physical token-based authentication systems to supplement knowledge-based factors such as passwords and personal identification numbers (PINs).[7] Organizations should migrate away from single-factor authentication, such as password-based systems, which are subject to poor user

Exhibit 18

choices and more susceptible to credential theft, forgery, and password reuse across multiple systems.

Remediate critical web application security risks

First, identify and remediate critical web application security risks. Next, move on to other less critical vulnerabilities. Follow available guidance on securing web applications.[8,9,10]

How do I respond to unauthorized access to election-related systems?

Implement your security incident response and business continuity plan

It may take time for your organization's IT professionals to isolate and remove threats to your systems and restore normal operations. In the meantime, take steps to maintain your organization's essential functions according to your business continuity plan. Organizations should maintain and regularly test backup plans, disaster recovery plans, and business continuity procedures.

Contact CISA or law enforcement immediately

To report an intrusion and to request incident response resources or technical assistance, contact CISA (Central@cisa.gov or 888-282-0870) or the FBI through a local field office or the FBI's Cyber Division (CyWatch@ic.fbi.gov or 855-292-3937).

Declaration of [redacted] Ph.D

November 30, 2020

Pursuant to 28 U.S.C Section 1746, I, [redacted], make the following declaration.

1. I am over the age of 21 years and I am under no legal disability, which would prevent me from giving this declaration.
2. [redacted] has a Ph.D in Electrical Engineering from the University of California at Davis and a Masters degree in Mathematics from the University of California at Berkeley. I have been employed, for over 28 years, in the signal processing and wireless signal processing domain, with an emphasis on statistical signal processing. I have published numerous journal and conference articles. Additionally, I have held Top Secret and SAP clearances and I am an inventor of nearly 30 patents, one of which has over 1000 citations in the field of MIMO communications (Multiple Input Multiple Output).
3. I reside at [redacted].
4. Given the data sources referenced in this document, I assert that in Georgia, Pennsylvania and the city of Milwaukee, a simple statistical model of vote fraud is a better fit to the sudden jump in Biden vote percentages among absentee ballots received later in the counting process of the 2020 presidential election. It is also a better fit when constrained to a single large Metropolitan area such as Milwaukee..
5. Given the same data sources, I also assert that Milwaukee precincts exhibit statistical anomalies that are not normally present in fair elections.. The fraud model hypothesis in Milwaukee has a posterior probability of 100% to machine precision. This model predicts 105,639 fraudulent Biden ballots in Milwaukee.
6. I assert that the data suggests aberrant statistical anomalies in the vote counts in Michigan, when observed as a function of time.

Signature:

Supporting evidence for the assertions in (4) and 5 is provided in the following pages.

1 Impact of Fraud on the Election

In the analysis that follows, it is possible to obtain rough estimates on how vote fraud could possibly have effected the election. In Georgia, there is evidence that votes were actually switched from Trump to Biden. As many as 51,110 Biden votes were fraudulent and as many as 51,110 votes could be added to Trump. An audit to determine vote switching will be more difficult, since it is likely the Trump ballots have been destroyed in Georgia, based on reports of ballots being shredded there. If instead we presume that Bidens fraudulent votes were simply added to the totals, then we estimate that 104,107 ballots should be removed from Biden's totals.

In Pennsylvania, from just one batch of absentee ballots, approximately 72668 of them are estimated to be fraudulent Biden votes. Our analysis of Milwaukee shows that 105,639 Biden ballots could be fraudulent. Moreover there is evidence of vote switching here, which might give as many as 42365 additional ballots to Trump, and remove the same from Biden.

Michigan yields an estimate of 237,140 fraudulent Biden votes added to the total, using conservative estimates of the Biden percentage among the new ballots.

2 Statistical Model

The simplest statistical model for computing the probabilities for an election outcome is a binomial distribution, which assigns a probability p for a given person within the population to select a candidate. If we assume that each person chooses their candidate independently, then we obtain the Binomial distribution in the form,

$$P(k|N) \equiv {}_NC_k p^k \left(1-p\right)^{N-k}, \tag{1}$$

where $P(k|N)$ is the probability that you observe k votes for a candidate in a population of N voters, and where ${}_NC_k$ is the number of ways to choose k people out of a group of N people.

For larger N, the binomial distribution can be approximated by a Gaussian distribution, which is used in the election fraud analysis in [1]. The chief reason for this is the difficulty of computing $P(k|N)$ for large N and k. However this problem can be overcome by computing the probabilities in the log domain and using the log beta function to compute ${}_NC_k$.

For this analysis it is more useful to compute the probabilities as a function of f the observed fraction of the candidate's votes. In this formulation we have $k = Nf$, and $N - k = N\left(1-f\right)$, and therefore we define the fractional probability as,

$$B_N(f) \equiv {}_NC_{Nf}\, p^{Nf} \left(1-p\right)^{N(1-f)}. \tag{2}$$

2.1 Fraud Model

To model voting fraud we assume a fixed fraction α of votes are given to the cheater. The pool of available voters who actually voted is now $N(1-\alpha)$. The fraction who actually voted for the cheater is given by $f-\alpha$. The probability that the fraction f voters reported for the cheater, with the fraction α stolen, can therefore be written as,

$$C_{N,\alpha}(f) \equiv B_{N(1-\alpha)}(f-\alpha). \tag{3}$$

This is similar to the fraud model used in the election fraud analysis given in [1]. We use the Binomial distribution directly, rather than the Gaussian distribution, since it should be more accurate for small N, k or f.

2.2 Posterior Probability of Fraud Model

A hypothesis test can now be set up between the standard voting statistics of (2) vs the statistics of the fraud model (3). If we use Bayesian inference we can compute an estimate of the posterior probability of the fraud model. This can be written as,

$$P(F|f) = \frac{C_{N,\alpha}(f)p_F}{C_{N,\alpha}(f)p_F + B_N(f)(1-p_F)},$$

where p_F is the prior probability of fraud. In our investigation we assume fraud is unlikely and set $p_F = 0.01$.

3 Analysis of Absentee Ballots in the 2020 Election

For this analysis we extracted data from the all_states_timeseries.csv file, which can be found at the internet url: https://wiki.audittheelection.com/index.php/Datasets. We look at the absentee ballot results near the beginning of the time series and then compare it to the end or the middle of the period, after a sufficient enough ballots were added.

For the models in Section 2 we assign the probability p of a Biden vote using the final data. This assumption is actually more favorable to the cheater. As mentioned earlier we set the prior probability of fraud to $p_F = 0.01$, and the cheating fraction, α, is set to $\alpha = f - p$, where f is the observed Biden fraction in the newly added ballots. This isolates the statistics of the added ballots from the final observed statistics.

We focus on the absentee ballots, because they are dominated by large democratic cities and there is no obvious reason why those statistics should change appreciably over time. Furthermore it should be noted that the start time for this data, mid day Nov. 4., was well after some of the larger absentee ballot dumps occured.

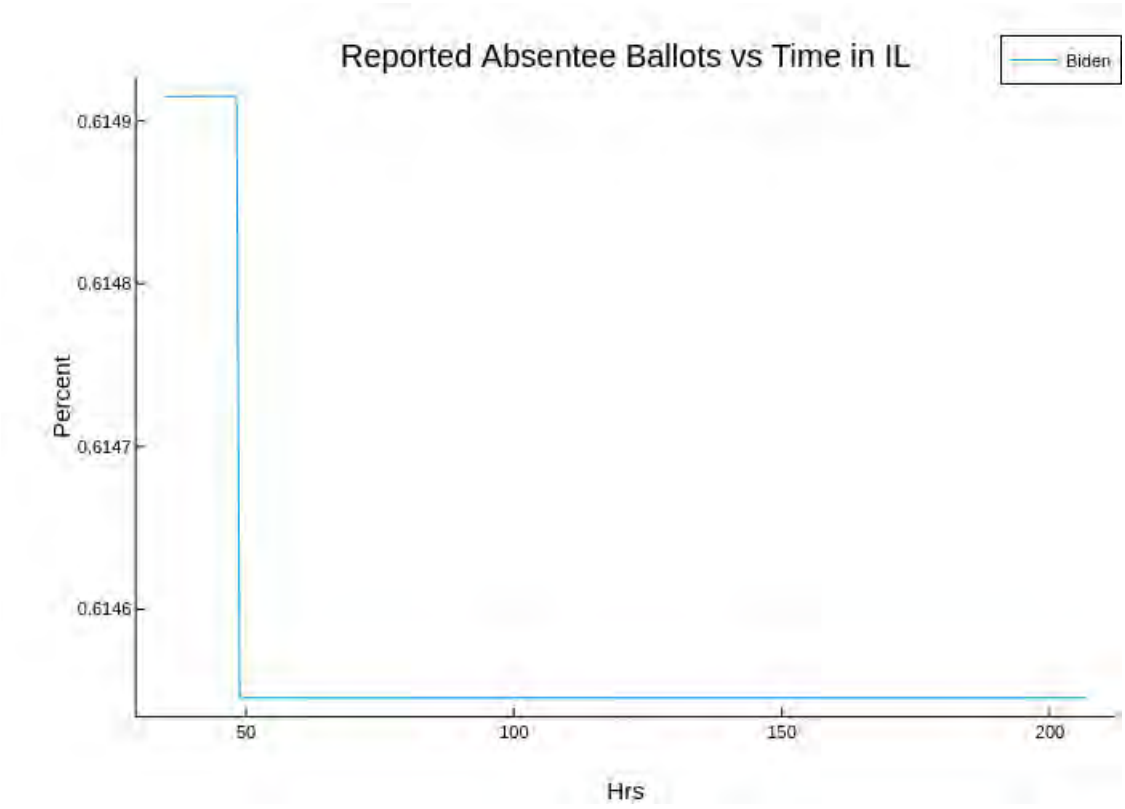

Figure 1: Reported Biden Fraction In Illinois vs Time

3.1 Control Case Illinois

We choose Illinois as a control case, since it has a significant number of absentee ballots that were counted later and provides a fairly clean baseline. The reported Biden fraction vs time is given in Figure 1.

As we can see there is not much change in the Biden statistics from the initial 601,714 absentee ballots when compared with the 54,117 ballots that were added. This is further shown by the bar chart in Figure 2.

Using our formula for the posterior probability of fraud in (3) we obtain the probability that the fraud model is correct of 6.5%. This lends good support to the idea that the Illinois absentee ballots were counted fairly.

3.2 Analysis of Georgia Absentee Ballots

The Georgia absentee ballot count started at 3,701,005 and 303,988 ballots were added. The Biden fraction among absentee ballots as a function of time is shown in Figure (3). This plot shows a statistical abnormality in that the

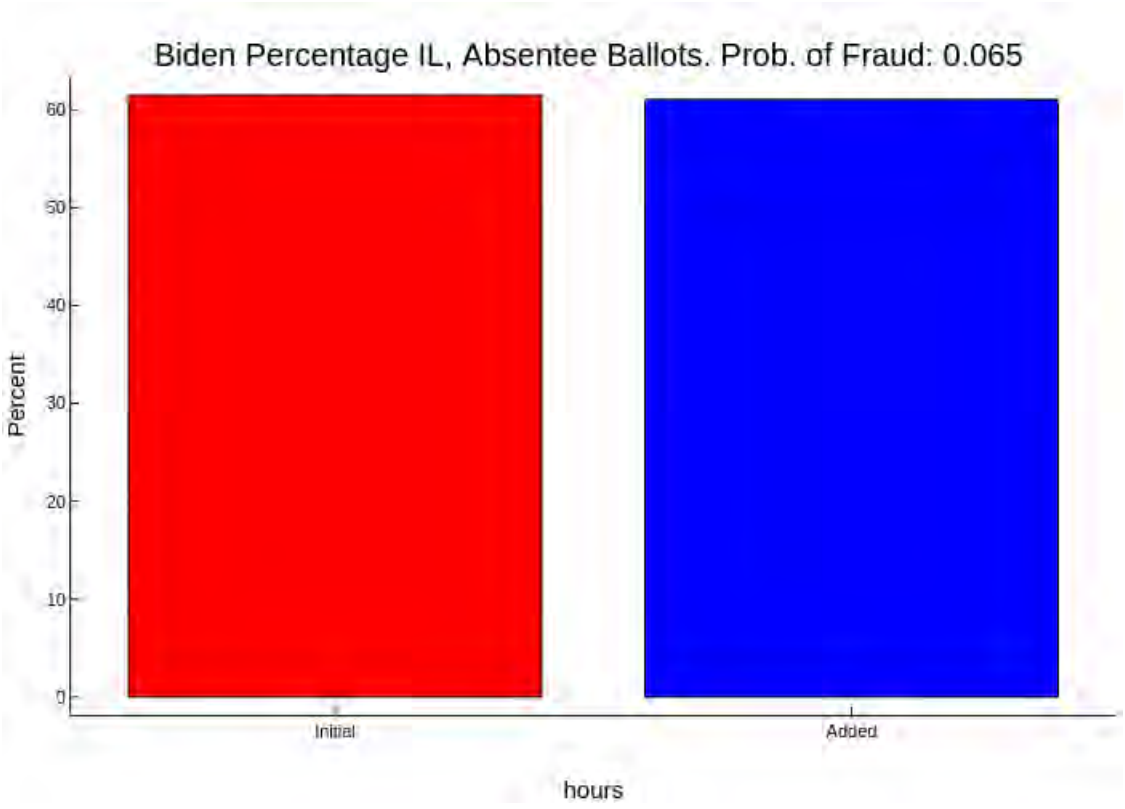

Figure 2: Before and Added Biden Fraction

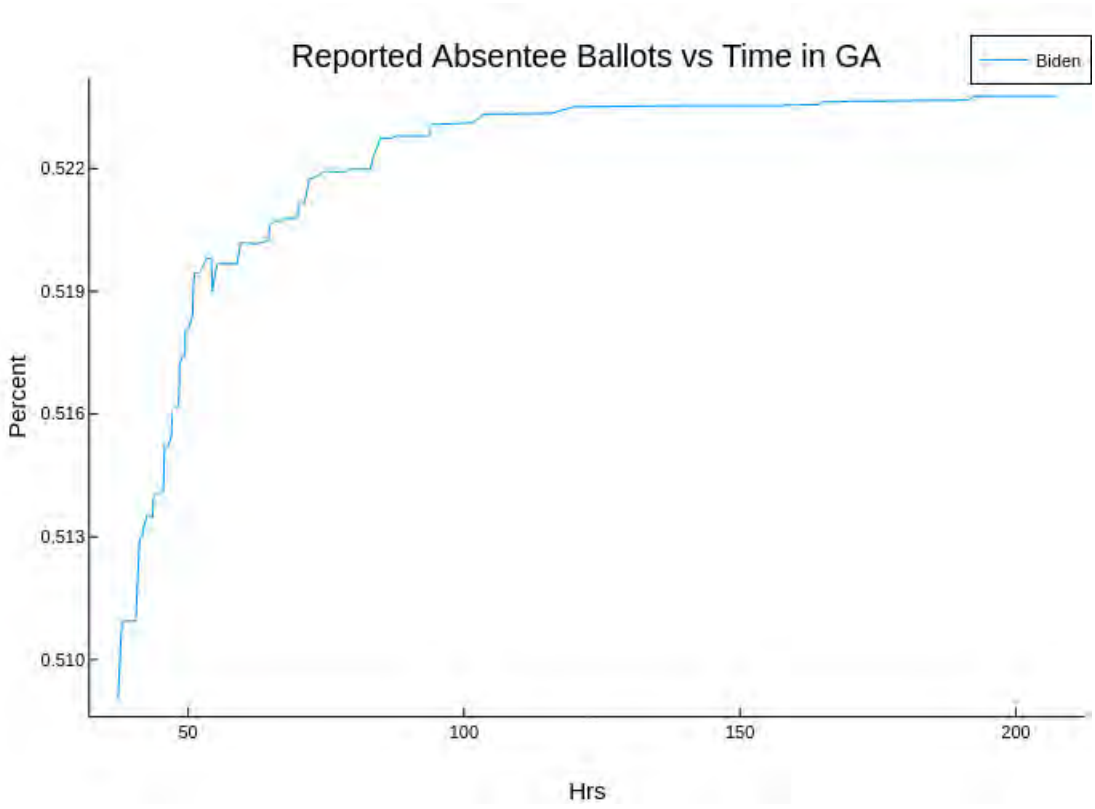

Figure 3: Georgia Absentee Ballots vs Time: (Biden Fraction)

Biden fraction appears to always be increasing. This is statistically unlikely and is not typically seen in fair elections. Normally you would see a mixture of votes of Biden and his opponents, and would see random deviation around the asymptote.

We investigate this phenomenon more fully in Figure (4). The added ballots have a Biden percentage of around 70%, while the initial statitics were at 50%. This is a very large jump for such a large sample size and seems very unlikely. Indeed the probability that the fraud model is correct is 100%, up to the precision of double floating point arithmetic.

Assuming that the prior absentee ballot distribution is the correct one, we can form a simple prediction for how many of Biden's ballots were fraudulent. Let $N_1 = 303,988$, the number of ballots added, and let $B = 189,497$ be the number of Biden votes in this new batch. If the fraction of Biden votes should actually be $f = 0.509$. Let x be the proposed number of fraudulent Biden votes,

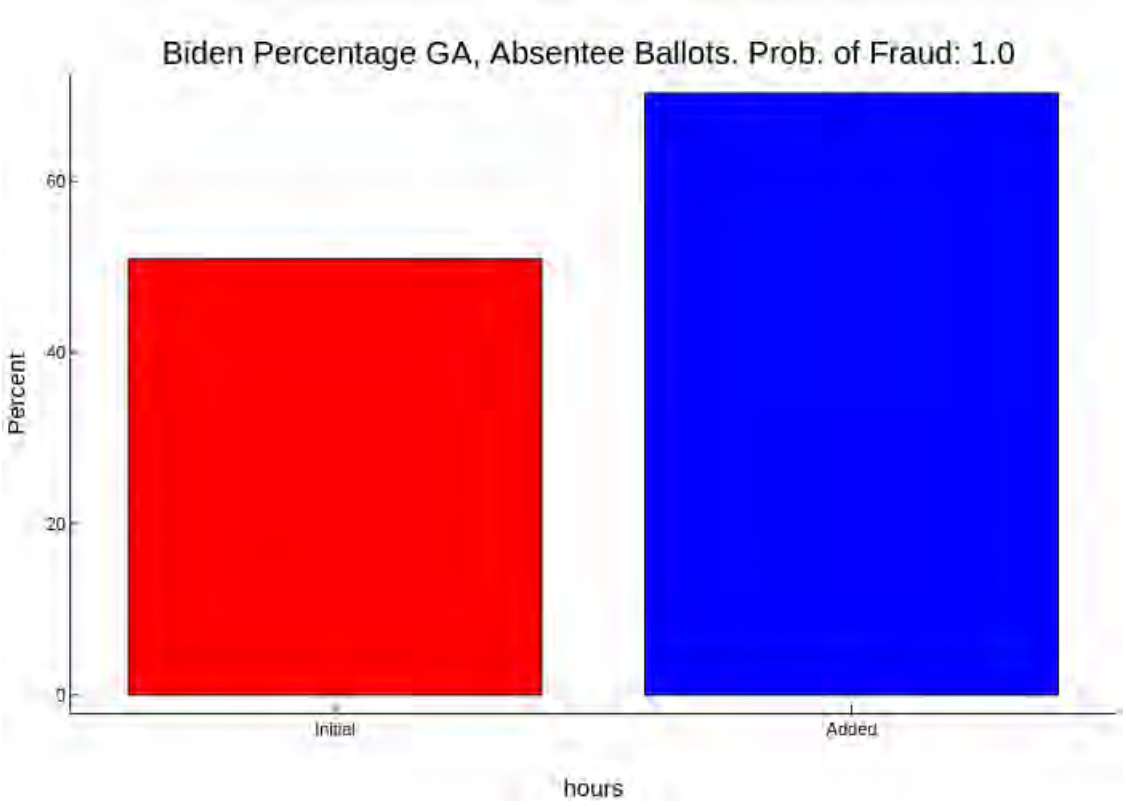

Figure 4: Before and After Biden Fraction in Georgia

then we have,

$$\frac{B-x}{N_1-x} = f$$
$$x = \frac{B-N_1 f}{1-f}. \tag{4}$$

In the case that votes were actually switched from Trump to Biden, then the formula becomes,

$$\frac{B-x}{N_1} = f$$
$$x = B - N_1 f$$

This would suggest that 104,107 ballots were fraudulently manufactured for Biden. If we presume that actually those ballots were switched from Trump to Biden then as many as 19% of the new absentee ballots for Biden were fraudulent, which totals around 51,110 ballots that should be removed from Biden's totals and added to Trump. We shall see in Section 6, that there is substantial evidence that some Trump votes were actually switched to Biden votes.

3.3 Analysis of Pennsylvania Absentee Ballots

The Pennsylvania absentee ballot count started at 785,473 and 319,741 ballots were added at 39 hours after the start of the data record. The Biden fraction among absentee ballots as a function of time is shown in Figure (5). This plot shows some oddities in that the Biden fraction fluctuates with large deviations.

In Figure (6) we see the initial Biden percentage compared with the Biden percentage of the added ballots over the first 39 hours. The added ballots have a Biden percentage of around 83%, while the initial statistics were at 78%. This is a very large jump for such a large sample size and seems very unlikely. Indeed the probability that the fraud model is correct is 100%, up to the precision of double floating point arithmetic.

If we just examine the initial large batch of votes among the absentee ballots, we see an unexplained jump of 5% for Biden. Although it is likely that most of the fraud, if any, occurred earlier in the vote count, just this batch of ballots suggests that approximately 72668 Biden ballots are fraudulent. If we presume that the votes were stolen from Trumps votes, then 15987 Biden ballots are fraudulent and should be added to Trump's total.

4 Analysis of Milwaukee County in Wisconsin

We now switch our analysis to a data set that contains precinct data for Milwaukee county. The data was obtained from the twitter acount of @shylockh, who derived his sources from the New York Times and in some cases from

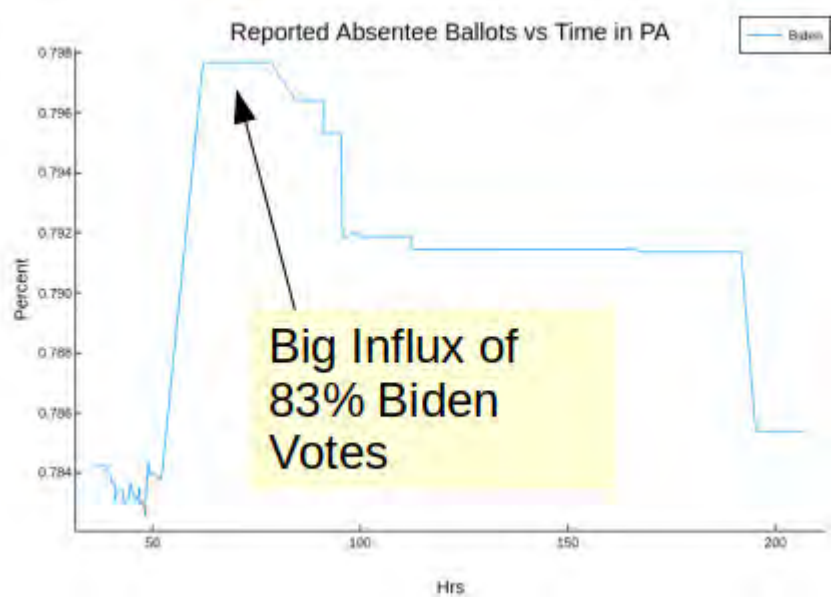

Figure 5: Pennsylvania Absentee Ballots vs Time: (Biden Fraction)

the unofficial precinct reports from the Wisconsin elections commision website. We examine vote percentages for ballots added between Wednesday morning, 11/04/2020 and Thursday night 11/05/2020.

This data set gives the total vote count by party affiliation. Because the data set is confined to Milwaukee, we can assume that the statistics should not be time varying. The voting pool here is highly partisan in favor of democrats and we don't expect any significant difference in the voting percentage, especially since a large number of absentee ballots were already counted by Wednesday morning.

4.1 Analysis of Milwaukee County Democrat results

The percentage of democrat voters increases by 15% among the ballots added on Wednesday and Thursday. On Wednesday morning Milwaukee had received 165,776 ballots. By Thursday evening 458,935 ballots were received, adding 293,159 ballots.

In Figure 7 we see the large deviation in democrat percentage between the Wednesday morning and those added by Thursday evening. This too causes the posterior probability of the fraud model to be 100% to machine precision.

Assuming that there was fraud, we estimate that 105,639 fraudulent Biden ballots were added between Wednesday and Thursday of 11/05/2020 in Milwaukee alone. However as we shall see below, many of these votes may well have been switched from Trump to Biden, which would also give Trump an additional

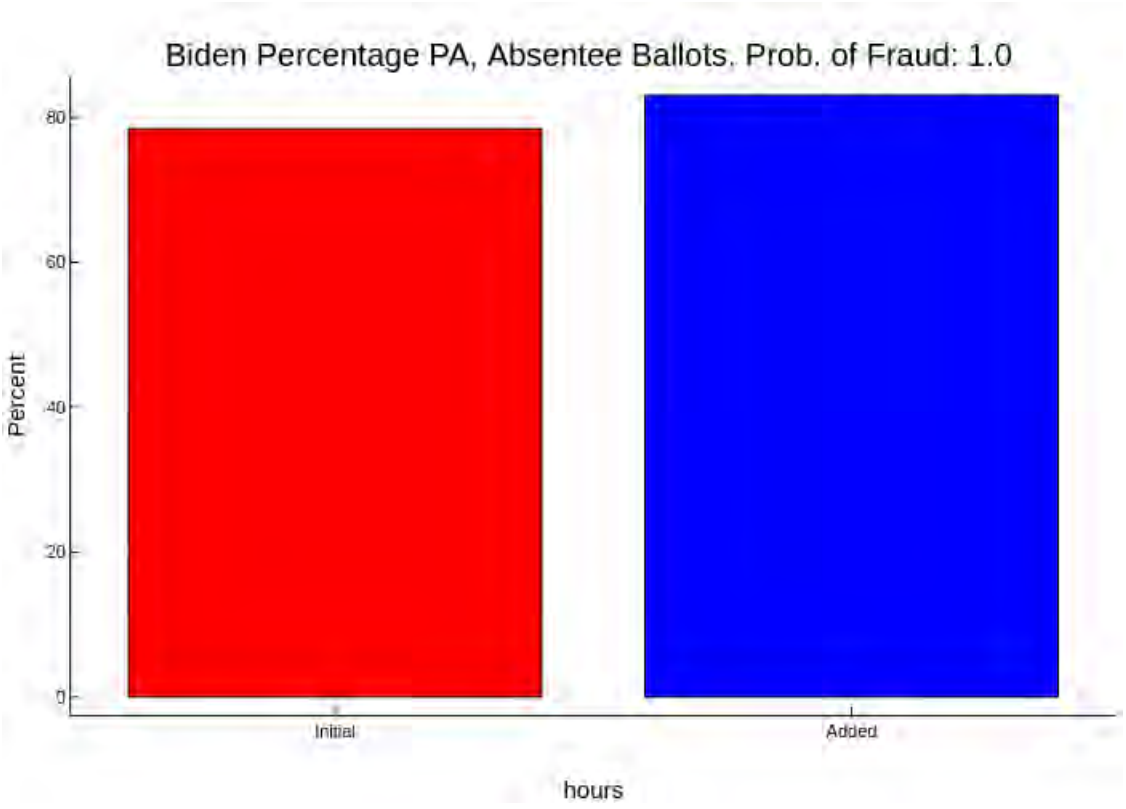

Figure 6: Before and After Biden Fraction in Pennsylvania

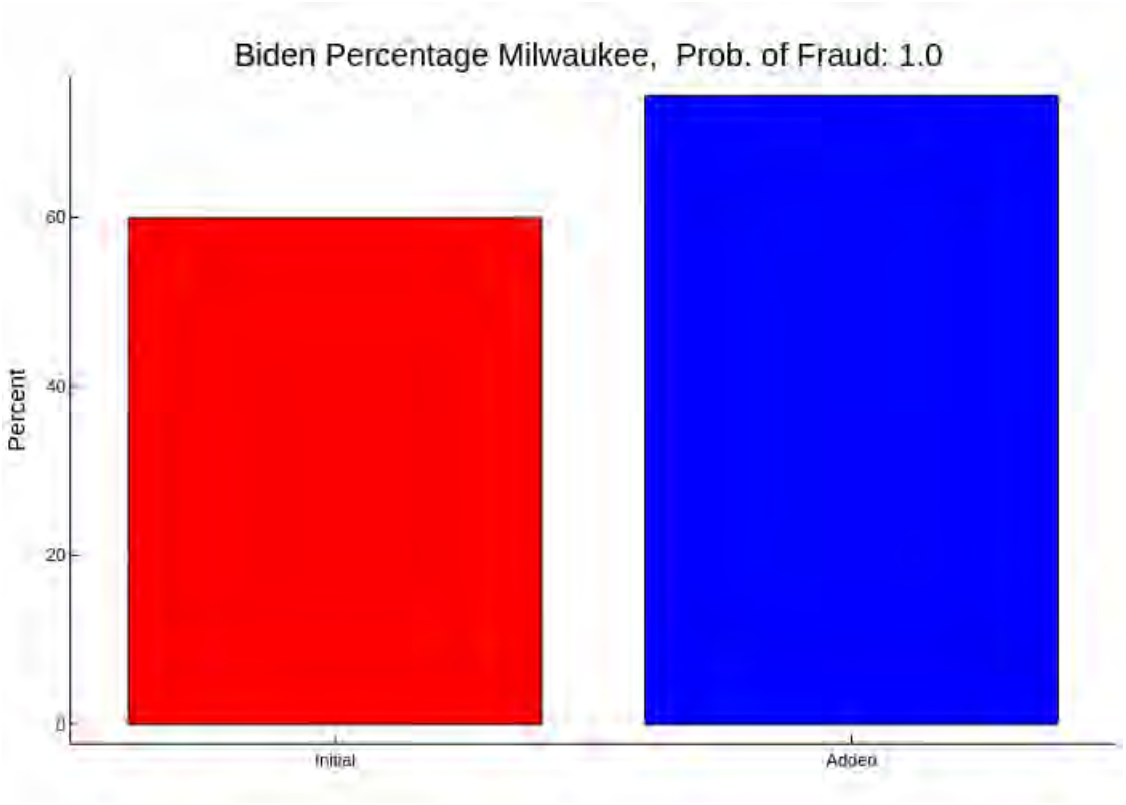

Figure 7: Before and After Democrat Fraction in Milwaukee

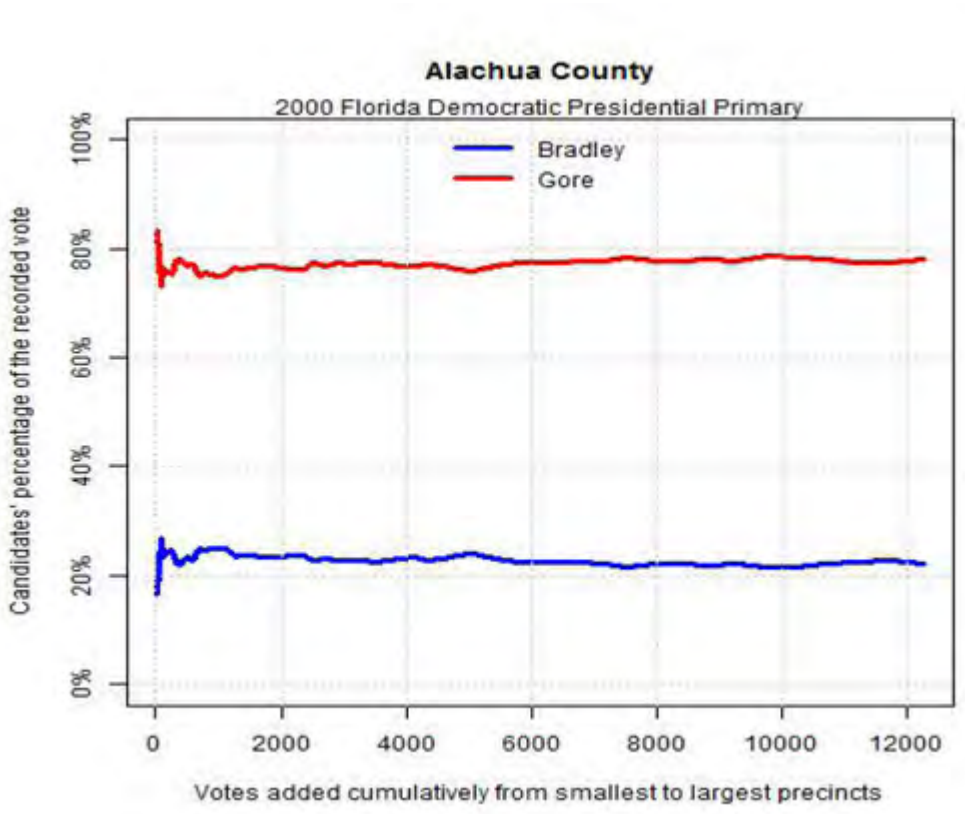

Figure 8: Baseline Cumulative Fractions Sorted by Precinct Size

42365 votes and remove 42365 votes from Biden.

4.2 Candidate Percentages Sorted by Ward Size

Another useful tool for evaluating fraud is to look at the cumulative vote percentages sorted by an independent input factor. An easy factor to use is ward or precinct size. This concept was used throughout the report on voter irregularities in [2]. In that report there was an anomalous dependency on precinct size in many of the 2016 primary elections. The larger precincts had introduced the use of voting machines. But one could also theorize the opportunity for cheaters to cheat in small precincts, where there may be less oversight.

Normally we would expect the cumulative vote percentage to converge to an asymptote, and bounce around the mean until convergence. An example of this can be found from the 2000 Florida Democratic presidential primary between Gore and Bradley. This is shown in Figure 8, and is taken from [2].

However when one sorts the Milwaukee, Thursday night data, by precinct

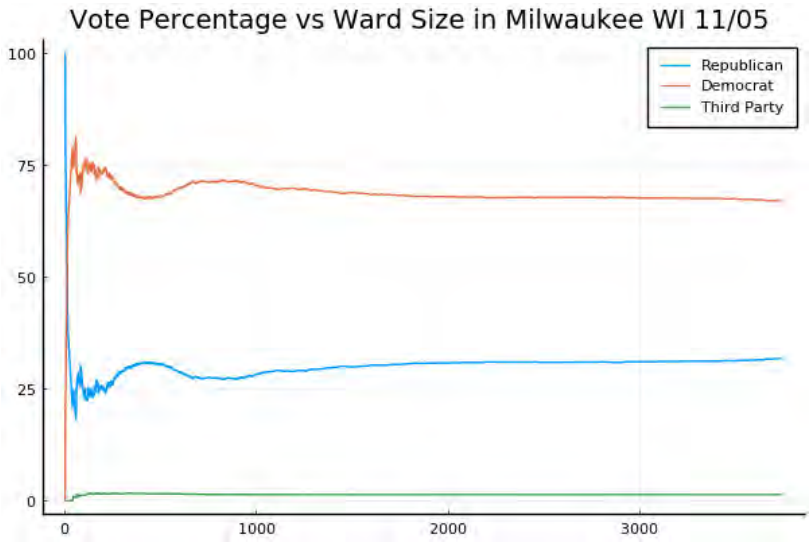

Figure 9: Milwaukee Democrat Ballots Percentage vs Ward Size

size, you will see trendlines that do not converge to an asymptote, as shown in Figure 9. It appears that smaller precincts almost uniformly have higher Democrat percentages. There is no obvious reason for this. It was certainly not seen in the control case in Figure 8. Furthermore the third party percentages quickly converge to their asymptote as would be expected in a fair election. One possible model for this would be vote switching from Trump to Biden, which would show up more strongly in the smaller precincts.

5 Analysis of Third Party Vote Count

Third party voters offer another way to examine a possible fraud mechanism. Votes could either be switched from third party candidates to the cheater, or fraudulent ballots that are added to benefit the cheater, may not include third party choices. For the control example, we look at absentee ballots in the state of Massachusetts. In Massachusetts the initial absentee ballot count was 117,618, and the number of added absentee ballots is 10,281.

The reported 3rd party percentage of absentee ballots vs time in Massachusetts is shown in Figure 10 and the comparison of the inital and added 3rd party ballots in MA is shown in Figure 11. There is only a small change in party preference, relative to the size of the added ballots. Therefore the probability of the fraud model is only 22%.

When we look at the total 3rd party percentages in Milwaukee, between Wednesday morning and Thursday night, we see a significant drop from 1.9 percent to 1.4% for the newly added ballots. But this is among 293,159 added

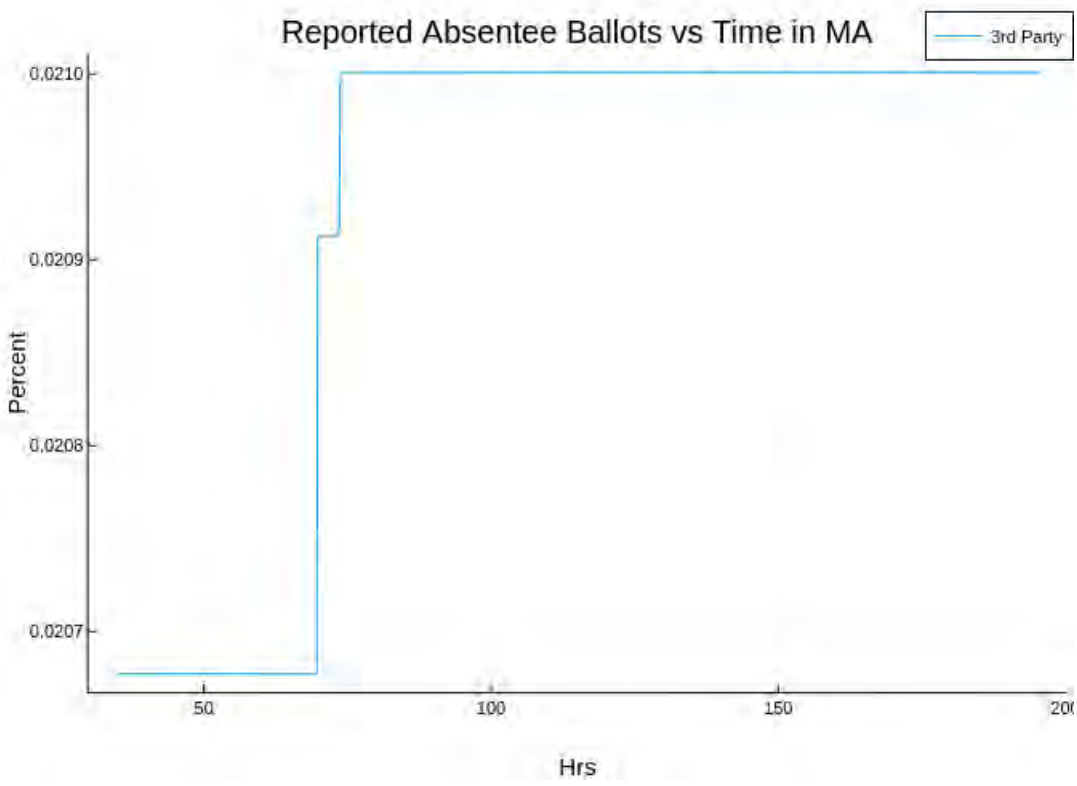

Figure 10: MA 3rd Party Absentee Votes vs Time

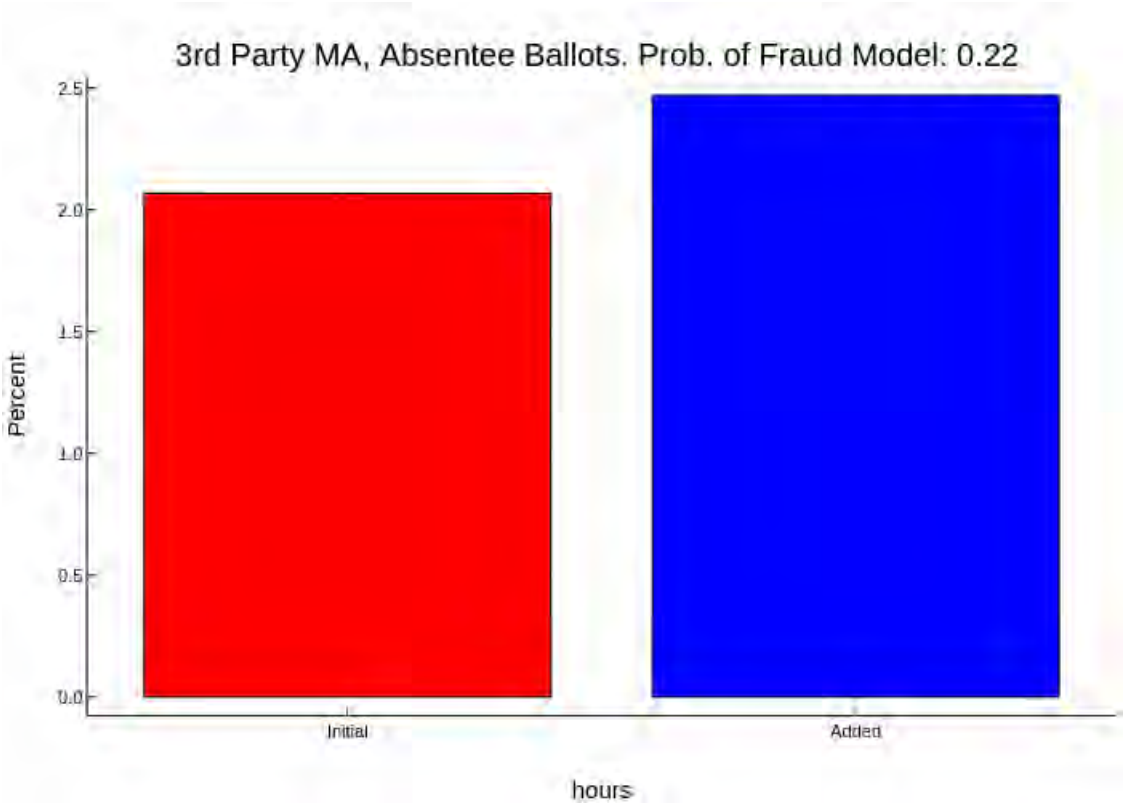

Figure 11: MA 3rd Party Percentage Initial and Added

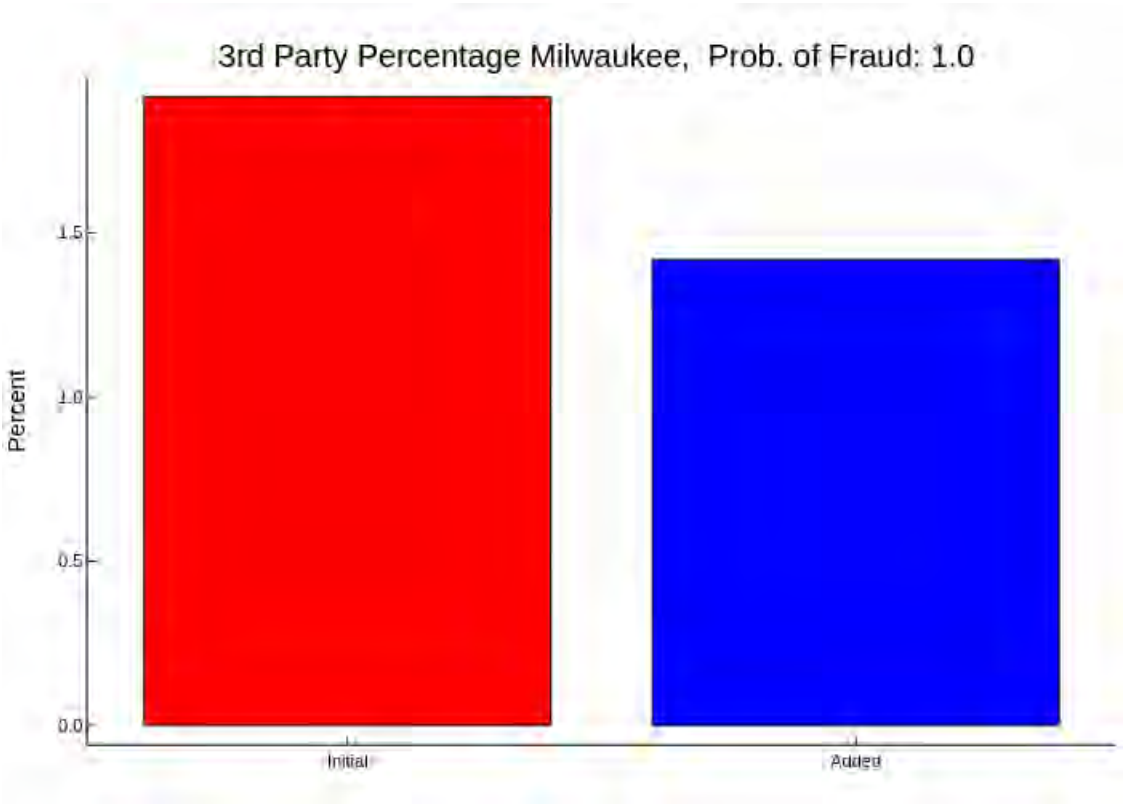

Figure 12: Milwaukee 3rd Party Percentages between Wednesday and Added

ballots. This is illustrated in Figure 12. Again in this case the fraud model has a posterior probability of 100% to machine precision.

6 Analysis of Fulton and DeKalb Counties in Georgia

We perform a precinct level analysis of Fulton and DeKalb counties in Georgia based on an aggregate data set likely culled from the New York Times. The Fulton data was collected on 11/08/2020 and the DeKalb data was collected on 11/09/2020. As in Milwaukee we look at the cumulative vote percentages as a function of precinct size. A plot of this for DeKalb county is shown in Figure 13.

Although there are somewhat concerning trendlines in the beginning, after the size 600 precinct mark, thereafter the overall picture is what one would expect of an election where the voter preferences are not dependent on precinct size. Both DeKalb and Fulton counties are in predominantly urban Atlanta,

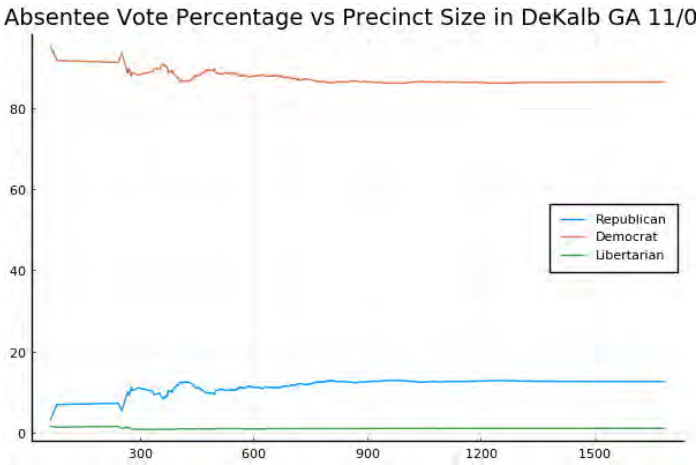

Figure 13: Dekalb County Absentee Ballots: Percentages vs Precinct Size

neighbor one another, and have similar voting preferences across precincts. DeKalb county is still suspect, however, due to the irregularites observed prior to the Ward 600 mark.

A different story emerges when we plot the absentee vote percentages for Fulton county as a function of precinct size, as can be seen in Figure 14. Here the trendlines for the Democrat and Republican percentages are quite pronounced, amounting to a difference of 8 percent from the halfway mark.

We divide the Fulton county data into a group of smaller precincts and larger precincts. One group has precincts less than 308 and another larger than 308. The total absentee ballots for the small group is 24,575, and the large group is 120,029. The small group has a Democrat percentage of 85% and the large group has a percentage of 77%, for a change of 8%. The fraud model is preferred in this scenario again with probability of 100% to machine precision.

One might presume that small precincts generally favor Democrats over large precincts, biasing the results. However take a closer look at the Libertarian party results in Fulton county in Figure 15. The percentages are exactly what we would expect if there were no bias in precinct size. The percentages bounce around a mean, not trending in any direction.

So if there were a bias favoring the democrats in small precincts, we would expect that to effect both the Republican and Libertarian totals. However it appears to only effect Republican totals, as if the Republican ballots were switched over to Democrat in a higher percentage in the smaller precincts. Indeed if a fixed number of ballots are switched in each district, it would have a larger effect in the smaller districts and then show up as trend lines in these percentage plots. At a minimum the data suggests a statistical anomaly that is not normally present in a fair election.

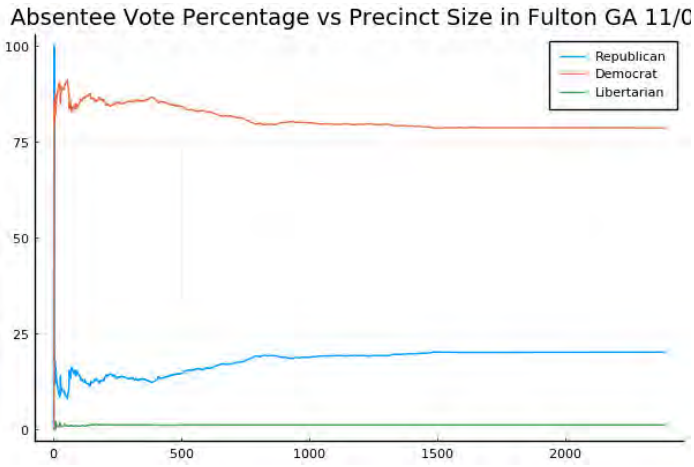

Figure 14: Fulton County Absentee Ballots: Percentages vs Precinct Size

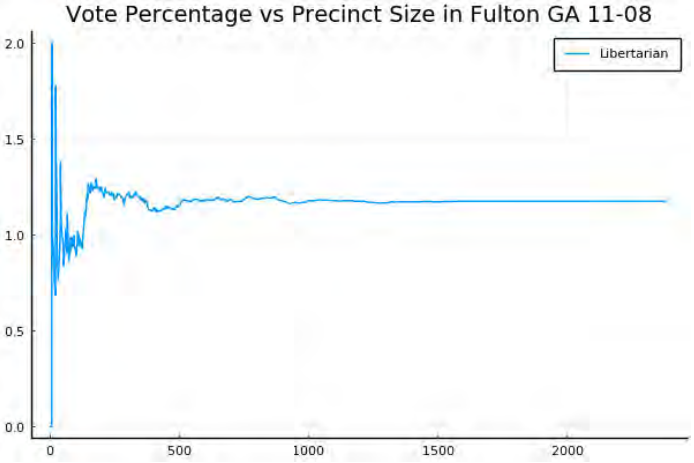

Figure 15: Fulton County Absentee Ballots: Libertarian Percentage vs Precinct Size

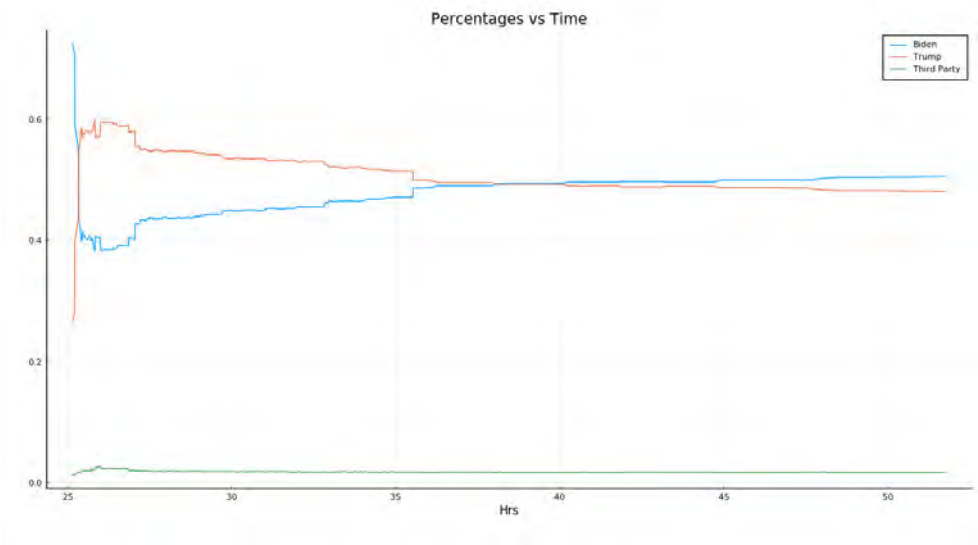

Figure 16: Michigan Vote Percentage vs Time

7 Michigan Analysis

We now due a time series analysis for Michigan. The data was culled from Edison Research. We first show, Trump, Biden and 3rd party voting percentages vs hours after the start of the election in Figure 16. The third party votes shows the proper convergence to an asymptote that we would expect from the law of large numbers. However the Trump and Biden percentages are vastly different You can see large discrete jumps in the percentages as very large Biden ballot dumps occur over time. You also see that the Biden percentages are mostly always increasing after hour 27, which is statistically unlikely in a fair election.

Note also that almost a million of the ballots are received by hour 27, and we use this as our starting point. At that point we have a total of 970,119 votes cast. At the end of 167 hours we have 5,531,222 votes cast. At our initial point the Biden percentage is 38%, but the new ballots have a Biden percentage totaling 53% as seen in Figure 17. The fraud model has posterior likelihood of 100% to machine precision.

For Michigan we compute the estimated amount of fraudulent Biden ballots conservatively, assuming that the 50.5 percent seen at the end of the count should have been the correct percentage among the newly added ballots. From this and (4) we obtain an estimate of 237,140 fraudulent votes added for Biden.

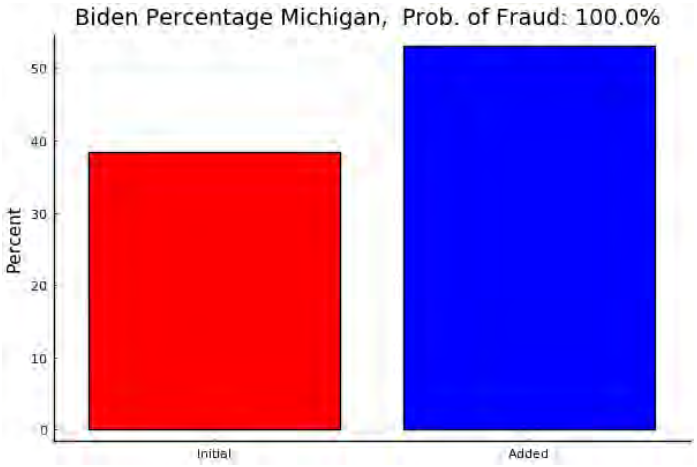

Figure 17: Biden Percentage Before and Added

It'IN THE UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff, **CASE NO. 2:20-cv-1771**

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

PLAINTIFF'S AMENDED MOTION FOR TEMPORARY RESTRAINING ORDER AND PRELIMINARY INJUNCTION TO BE CONSIDERED IN AN EXPEDITED MANNER

COMES NOW Plaintiff, William Feehan by and through his undersigned counsel, and moves for a Temporary Restraining Order (TRO), or in the alternative, a preliminary injunction, to be considered in an expedited manner. This Motion is submitted pursuant to FRCP 65 and Civil L. R. 7.

In support of this Motion, Plaintiff has this day filed his Amended Complaint and supporting Exhibits. Plaintiff further states and shows:

Standards for a TRO and preliminary injunction are the same. *Local Lodge No. 1266, Int'l Ass'n of Machinists & Aerospace Workers, AFL-CIO v. Panoramic Corp.*, 668 F.2d 276, 291 (7th Cir. 1981). Plaintiff must make an initial showing that he (1) is likely to succeed on the merits, (2)

has no adequate remedy at law, and (3) will suffer irreparable harm if injunctive relief is not granted. *See, e.g., Hodgkins ex rel Hodgkins v. Peterson,* 355 F.3d 1048, 1054-55 (7th Cir.2004)**.** The Court then considers (4) whether the balance of harm to Plaintiff if the TRO not correctly granted outweighs the harm to the defendant if the TRO is wrongly granted, and (5) the public interest. *Cooper v. Salazar,* 196 F.3d 809, 813 (7th Cir.1999)**.**

Plaintiff Will Suffer Irreparable Harm If a TRO Is Not Granted

1. Plaintiff brings this action and has filed his Motion for TRO to enjoin Defendants' certification of the November 3, 2020, Presidential election in Wisconsin in order to prevent irreparable harm to Plaintiff and lawful voters of Wisconsin and other states across the nation who would suffer disenfranchisement of their election rights by improper and unlawful certification of the Wisconsin election results in favor of Presidential candidate Joe Biden.

2. An unlawful certification in one state, like Wisconsin, will necessarily harm the State of Wisconsin and all other states and their lawful voters by altering the Presidential election outcome, undermining both confidence in and integrity of the election process.

3. Absent granting the TRO requested, Plaintiff and similarly situated lawful voters will suffer irreparable harm because the conduct of the election and recount contrary to law undermines election integrity, debases and dilutes their votes, and effectively disenfranchises them.

4. Further, any recalibration, reset, wiping, or other alteration or destruction of election data or materials from voting machines, tabulations machines, or other election-related mechanisms, servers, software, voting machines, tabulators, printers, portable media, logs, or processes, and any alteration or destruction of ballot applications, ballot return envelopes, ballot images, paper ballots, registration lists, poll lists, or any other "election materials" referenced in Wisconsin Statutes § 9.01(1)(b)11. related to the November 3, 2020 Wisconsin election, whether pursuant to § 7.23,

Wisconsin Statutes, or otherwise, will make it impossible to conduct a valid inspection by Plaintiff's experts or others.

5. Plaintiff will be irreparably harmed if all such acts affecting election data or materials are not immediately enjoined across the state of Wisconsin pursuant to 52 U.S.C. § 20701 (preservation of voting records) to prevent destruction or alteration of evidence essential to individual and/or forensic examination and audit of the election computer systems and materials.

Plaintiff Is Likely to Prevail on the Merits

6. Plaintiff's Amended Complaint and Motion present material dispositive issues which are questions of law that may be resolved without factual investigation or determination.

7. Plaintiff is more likely to succeed on the merits of his claims than not due to substantial and multiple violations of Wisconsin election laws, including counting of unlawfully cast ballots, resulted in unfair advantage to some voters, discriminating against and denying equal protection to Plaintiff and other lawful Wisconsin voters, effectively disenfranchising them of their lawful rights of suffrage, all as provided in his Amended Complaint.

8. In further support is the WEC's illegal certification of the Statement of Canvas by Chair, Ann S. Jacobs, who directly violated the statutory guarantee of a 5 business day waiting period pursuant to Wis. Stat. § 9.01(6), by failing to wait the required time period and rushed to certify the canvas on the day it was completed November 30, 2020.

9. Governor Evers also illegally certified the *Statement of Canvas* that same day, thus foreclosing any opportunity for a candidate to challenge the recount. Wis. Stat. § 7.70(5)(a), explains "When a valid petition for recount is filed . . . the governor or commission may not issue a certificate of election until the recount has been completed **and the time allowed for filing an appeal has passed . . . .**"

The Balance of Equities Favors Plaintiff

10. The political advantage to either Presidential candidate created by unlawful certification is substantially less significant than the certification of an erroneous Presidential election result and loss of confidence and distrust that will be generated within the public at large if certification is not temporarily enjoined to consider the merits of Plaintiff's allegations of statistical anomalies, unlawful conduct of the election and recount, fraudulent manipulation of software and voting machines employed to tabulate votes, and other unlawful conduct alleged in his Amended Complaint.

11. Granting a TRO to halt the certification to permit consideration and determination of the grave issues presented by Plaintiff will thus prevent an erroneous certification of the Presidential election result and even further erosion of public confidence in the election's integrity and outcome.

Granting the TRO Is in the Public Interest

12. Wisconsin has a substantial obligation to its citizens and the rest of the nation to ensure that its electors are properly elected and legitimately certified. The process by which Wisconsin represents and pledges it electors must comply with state and federal constitutional and statutory requirements and cannot be a rushed, perfunctory, same-day certification.

13. Nothing is more sacred to a representative republic than the integrity of its elections. A TRO is essential to ensure the integrity of this and future elections for Wisconsin and the nation.

Respectfully submitted, this 3st day of December 2020.

JAMES GESBECK'S MOTION TO INTERVENE

I, James Gesbeck, a citizen of the state of Wisconsin am seeking to participate as an intervening defendant in the above-captioned lawsuit pursuant to Federal Rule of Civil Procedure 24. I have a right under Rule 24(a)(2) to intervene for the reasons outlined in the attached memorandum. In the alternative, I seek permissive intervention pursuant to Rule 24(b).

I am a licensed attorney in the State of Wisconsin; however, I am not admitted to practice before the Eastern District Court of Wisconsin. As a result, I am appearing as a pro se party under General Local Rule 83(b) and pursuant to the limitations of General Local Rule 83(e) as I am a natural person. As I am not admitted to practice before the Eastern District Court of Wisconsin, I am filing via paper under General Local Rule 5(a)(2).

I respectfully request an expedited briefing schedule and decision regarding this motion. This request is being made to allow me the opportunity to protect my interests which are directly impacted by this litigation. This is particularly important as the plaintiffs are seeking "emergency injunctive relief"[1]. However, as the court noted in its Order Regarding Amended Motion for

[1] See Dkt. No. 1 titled "Complaint for declaratory, emergency, and permanent injunctive relief" and Dkt. No. 2 titled "Plaintiff's motion for declaratory, emergency and permanent injunctive relief.

Injunctive Relief, while using the word "emergency" neither the motion nor proposed order request the court to move more quickly and explain the basis for such a request.[2]

Therefore, I request that the Court grant me permission to intervene in the above-captioned matter. Further I request that the Court authorize me to file via ECF[3].

COUNT I

102. No response required.

103. Admitted.

104. Admitted.

105. Admitted.

106. I deny that the instances described violate the Wisconsin Election Code.

107. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 107.

108. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 108.

109. I deny that the plaintiffs have no remedy. Challenges to the election should be brought before the Wisconsin Courts, see Wis. Stat. § 9.01(6).

110. I deny the court has the authority to grant such an extreme remedy.

COUNT II

111. No response required.

112. Admitted.

113. Admitted.

114. Admitted to the extent it is theoretical, denied if it is a factual allegation.

115. Admitted.

116. Denied.

117. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 117.

118. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 118.

119. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 119.

120. I admit the remedies requested would be proper if such violations existed.

121. I deny the plaintiffs have no remedy. Challenges to the election should be brought before the Wisconsin Courts, see Wis. Stat. § 9.01(6).

COUNT III

122. No response required.

123. Admitted.

124. Admitted.

125. Admitted.

126. Admitted.

127. Admitted.

128. Admitted.

129. Admitted.

130. Denied.

131. I deny that the requested relief sought is proper. The remedy for the plaintiffs lies in Wis. Stat. § 9.01(6).

COUNT IV

132. No response required.

133. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 133.

134. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 134.

135. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 135.

136. I lack sufficient knowledge or information to form a belief as to the truth of the allegations in Paragraph 136.

137. Admitted.

138. I deny the plaintiffs have no remedy. Challenges to the election should be brought before the Wisconsin Courts, see Wis. Stat. § 9.01(6).

139. I deny that the requested relief sought is proper. The remedy for the plaintiffs lies in Wis. Stat. § 9.01(6).

140. I deny that the requested relief sought is proper. The remedy for the plaintiffs lies in Wis. Stat. § 9.01(6).

141. I deny that the requested relief sought is proper. The remedy for the plaintiffs lies in Wis. Stat. § 9.01(6).

142. I deny that the requested relief sought is proper. This is request seeks to discard my vote.

143. I deny that the requested relief sought is proper

AFFIRMATIVE DEFENSES

I assert the following affirmative defenses.

1. Plaintiffs lack standing to assert their claim.
2. Plaintiffs are not represented by the lawyers filing this action. See https://twitter.com/derrickvanorden?lang=en (last accessed 5:02pm, 12/2/2020).
3. The complaint fails to state a claim upon which relief be granted.
4. The court does not have jurisdiction over this action and the authority to grant the requested relief as it conflicts with the State's authority to regulate elections granted by the U.S. Constitution.

MY REQUEST FOR RELIEF

I request the court acts as follows:

1. Deny the plaintiffs request for wholesale disenfranchisement of Wisconsin voters and me specifically.
2. Dismiss the plaintiff's complaint with prejudice
3. Grant such other and further relief as this Court deems just and proper.

Plaintiff

Case No. 20-cv-1771

v.

Wisconsin Elections Commission, *et al.*,

Defendants

BRIEF IN SUPPORT OF MOTION TO INTERVENE

Pursuant to Federal Rule of Civil Procedure 24, I move to intervene as a defendant in this lawsuit. The relief being sought by the plaintiffs includes, inter alia, "an order directing Governor Evers and the Wisconsin Elections Commission to de-certify the election results" and an "order requiring Governor Evers to transmit certified election results that state that President Donald Trump is the winner of the election". I was a voter in the 2020 General Election in the State of Wisconsin. If the court grants the relief sought by plaintiffs, it will disenfranchise my vote.

BACKGROUND

This litigation centers around the 2020 General Election. As the court is likely aware, there are various theories and arguments being proffered that seek to have the election results in this State and other States rejected. This is one of those cases.

The plaintiffs allege that there is a massive election fraud to the scale that they believe requires this court to order the defendants to de-certify the election results and to order Governor Evers to transmit election results stating that President Donald Trump won the election.

I was a voter during the 2020 General Election in the State of Wisconsin. Specifically, I voted in Dane County, my county of residence, via absentee ballot. Dane County is specifically referenced in Paragraph 2 of the original complaint for having an "especially egregious range of conduct".[1]

ARGUMENT

I am entitled to intervene as a right.

I qualify for intervention as a right under Fed. R. Civ. P. 24(a)(2). I meet the criteria established by case law for intervention that were established by *Driftless Area Land Conservancy v. Huebsch*, 969 F.3d 742, 746 (7th Cir. 2020).

The motion to intervene is timely

This motion is being timely filed. This lawsuit originated on December 1st, 2020. This motion and brief are being drafted on December 2nd, 2020. This motion and brief will be sent to the Clerk via overnight delivery and should arrive December 3rd, 2020. A motion to intervene filed within 2 days of a lawsuit should be considered timely. Additionally, there is not any pending briefing or motion schedule set in the court as of the day and time of drafting this memorandum at 3:40pm on December 2nd, 2020.

I have an interest in the outcome of this litigation

This litigation directly concerns my vote that was cased in the 2020 General Election in Wisconsin. The right to not only vote, but to have that voted counted is fundamental. See *Harper v. Va. State Bd. of Elections*, 383 U.S. 663 (1966) and *Reynolds v. Sims*, 377 U.S. 533, 554 (1964). Further this interest is "individual and personal in nature". *Gill v. Whitford*, 138 S. Ct. 1916, 1930 (2018)

[1] [1] See Dkt. No. 1 titled "Complaint for declaratory, emergency, and permanent injunctive relief" ¶ 2.

This interest would be impaired by disposition of this case

The plaintiff's proposed relief includes an order to the defendants requiring them to "de-certify the election results" and "order requiring Governor Evers to transmit certified election results that state that President Donald Trump is the winner of the election". This would disregard the results of the 2020 General Election in Wisconsin in which my vote was cast. A court order directing the outcome of the election would disenfranchise me by not counting my vote, nor the votes of millions of people. This directly harms and impairs my right to vote as it would exclude my vote from being counted. See *Harper v. Va. State Bd. of Elections*, 383 U.S. 663 (1966) and *Reynolds v. Sims*, 377 U.S. 533, 554 (1964).

My interests are not adequately represented by Defendants

The right to intervene can be denied if my interests are adequately represented by the defendants. This is a liberal rule which is satisfied by showing that the representation may be inadequate and that the burden of this showing should be treated as minimal. *Driftless Area Land Conservancy v. Huebsch*, 969 F.3d 742 (7th Cir. 2020).

My interest in this case is to defend my constitutional right to vote. Neither of the named defendants, Wisconsin Elections Commissions, its members, and Governor Tony Evers are tasked with protecting my right to vote. As a result, the existing Defendants do not and are not responsible for representing my interests.

The defendant's interest in this litigation is defined by their statutory duties and statutory roles. Additionally, the defendants are broadly responsible for representing the entire State of Wisconsin as a whole and not individual voters. See, e.g., *Utah Ass'n of Counties v. Clinton*, 255 F.3d 1246, 1255-56 (10th Cir. 2001).

Additionally, protecting the interest of individual's voter right to vote should not be assumed to be role of either the Governor or the Wisconsin Elections Commission. The right to vote is an individual right. *Gill v. Whitford*, 138 S. Ct. 1916, 1930 (2018). There is no constitutional text nor statute making either the Governor or the Wisconsin Elections Commission responsible for protecting the right to vote. Additionally, at times the interest of those parties may be averse to the individual right to vote as occurs during lawsuits over felon disenfranchisement.

I am also entitled to permissive intervention

I also meet the requirements for permissive intervention under Rule 24(b). The Court has broad discretion to grant a motion for permissive intervention where: (1) the proposed intervenor's claim or defense and the main action have a question of law or fact in common, and (2) the intervention will not unduly delay or prejudice the adjudication of the original parties' rights. See Fed. R. Civ. P. 24(b)(1)(B) and (b)(3); Bond v. Ultreras, 585 F.3d 1061,1070–71 (7th Cir. 2009). Even in cases where courts have found that intervention is not available as a right, courts have allowed permissive intervention. See, e.g., *City of Chicago v. Fed. Emergency Mgmt. Agency*, 660 F.3d 980, 986 (7th Cir. 2011); see also *Solid Waste Agency*, 101 F.3d at 509.

Should my vote be not counted, I would have a cause of action to seek a court order requiring these defendants to honor my vote. Such an additional court action would hamper judicial economy. Additionally, any such action would rely on the same facts and issues of law as this litigation.

I would be prepared and willing to proceed in accordance with any schedule, including expediated schedule that this court may set.

CONCLUSION

For the reasons states above, I am entitled to intervention as a right and in the alternative the court should grant me permissive intervention.

Plaintiffs,

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMANN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

Case No.: 20CV1771

MOTION TO REASIGN CASE PURSUANT TO CIVIL L.R. 3(b)

Defendant Tony Evers respectfully moves to have the foregoing case—*Trump v. Wisconsin Elections Commission, et al.*, No. 20-CV-1785—reassigned, as it is related to the instant action under Civil Local Rule 3(b). While judicial efficiency and a desire to avoid conflicting opinions underscore virtually every request to relate cases, that is especially true here with the federal safe-harbor date approaching on December 8 and the meeting of the Electoral College on December 14. *See* 3 U.S.C. §§ 5, 7 and Wis. Stat. § 7.75.

Civil Local Rule 3(b) provides that the factors to be considered in determining whether the actions are related include whether the actions: (i) arise from substantially the same transaction or events; (ii) involve substantially the same parties or property; or (iii) involve the same patent, trademark or copyright. It further provides that the judge to whom the action with the lower-case number is assigned will resolve any dispute as to whether the actions are related.

Promptly upon learning of the *Trump v. Wisconsin Elections Commission* action late yesterday evening, Defendant's counsel prepared and filed a notice of related case. That notice, which is attached hereto as Exhibit 1, explains that the *Feehan* and *Trump* actions arise form

substantially the same transaction or events (the administration of the November 3, 2020 Presidential election), and involve substantially the same parties (the Wisconsin Elections Commission, Ann S. Jacobs, Mark L. Thomsen, Marge Bostelmann, Dean Knudson, Robert F. Spindell, Jr., and Governor Tony Evers are named defendants in both actions).[1] Both cases also seek similar relief: To overturn the results of the recent election and in so doing deny more than three million Wisconsinites of their fundamental right to vote.

Accordingly, the two cases are related within the meaning of Civil Local Rule 3(b), and Defendant Evers respectfully requests that the latter-filed action be reassigned to this Court.

Respectfully submitted this 3rd day of December 2020.

IN THE UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff, **CASE NO. 2:20-cv-1771**

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

PLAINTIFF'S OPPOSITION TO
DEFENDANT GOV. TONY EVERS' REQUEST TO REASSIGN

Defendant Gov. Tony Evers has filed a motion to reassign *Trump v. Wisconsin Elections Commission, et al.*, Case No. 20-CV-1785 to this action under Civil Local Rule 3(b). Plaintiff William Feehan opposes Defendant Evers' as follows.

1) **Defendant Evers' Seeks to Nullify Through Delay Over 1.6 Million Lawful Wisconsin Votes and Disenfranchise the Voters Who Cast Them.**

With the College of Electors scheduled to meet December 8, there could never be a clearer case of "justice delayed is justice denied."

Defendant proposes a trivial, wooden application of a simple local rule designed for efficiency to achieve exactly the opposite of its purpose, turning the rule on its head to deflect and fatally

delay consideration of the most monumental constitutional rights and issues that will ever come before this Court, disenfranchising Plaintiff and 1.6 Million lawful Wisconsin voters in the process.

Defendant's Motion to reassign is simply a transparent effort to clutter and bog down Plaintiff's action with multiple additional parties, procedural issues, and state law matters, the purpose of which is to consume time, slow-walk Plaintiff's action, and run out the clock.

The additional parties and issues are utterly unnecessary and distracting to consideration of Plaintiff's Amended Complaint and supporting Memorandum and determination of Plaintiff's TRO Motion.

Defendant Evers' Motion should be summarily denied and the Court should immediately order briefing and issue its decision no later than 5 p.m. Sunday evening, December 6 so that Plaintiff may have even a few hours to prepare for and seek whatever further relief may be then available in the one day left before the December 8 meeting of electors.

2) The Pleadings in Case No. 20-CV-1785 Do Not Relate in Any Way to the Gravamen of Plaintiff's Amended Complaint that Plaintiff and Over 1.6 Million Lawful Wisconsin Voters Were Disenfranchised by Massive Fraud, Hacking, Ballot-Stuffing, and Ballot-Changing by Dominion and Other Foreign and Domestic Actors Vehemently Antagonistic to the President.

The issues raised in the President's action in Case No. 20-CV-1785 reflect federal aspects of the state law issues raised in his Petition for Original Action just dismissed by the Wisconsin Supreme Court, *Trump v. Evers*, 2020 AP 001971-OA.

While the President's federal and state claims are obviously related to some of state law issues and actions of state officials that are included in Plaintiff's amended complaint, neither pleading in those cases addresses the central issue of Plaintiff's action here – foreign and domestic actors programming, manipulating, hacking, and tampering with election equipment and software to change votes and "elect" a candidate for which a majority of lawful Wisconsin voters did not cast their ballots.

The detailed technical pleadings and proof alleged by Plaintiff[1] are utterly absent in the President's pleadings, which do not relate whatsoever to the gravamen of Plaintiff's Amended Complaint that over 1.6 Million lawful Wisconsin votes were diluted and debased and that that Plaintiff and the other voters who cost them were effectively disenfranchised by massive electronic fraud, ballot-stuffing, and ballot-changing by Dominion and other foreign and domestic actors vehemently antagonistic to the President.

3) Defendants' Counsel Did Not Agree to or Propose a Briefing Schedule, so the Court Should Immediately Schedule Briefing and Rule on Plaintiff's TRO Motion no later than 5 p.m. Sunday evening, December 6.

As ordered by the Court December 2, the Parties' counsel met and conferred today regarding a briefing schedule. However, Defendants refused to agree to the schedule proposed by Plaintiffs, and in fact, refused to offer a proposed schedule of their own, stating that they were seeking reassignment of Case No. 20-CV-1785, which they have now done.

In fact, when Plaintiff's raised the issue of a stipulated TRO to preserve electronic and physical data, materials, and equipment (voting machines in particular) for inspection by Plaintiff's experts, Defendants asserted that they have no control or influence whatsoever over preservation of evidence by local jurisdictions and elections clerks, apparently implying that Plaintiff must implead all 1,912 individual municipalities that conduct voting operations in order to obtain relief.[2]

---

[1] See Amended Complaint ¶¶ 6-17 (Dominion), 46-58 (statistical analysis by national experts), 60-99 (factual allegations regarding Dominion), 100-110 (statistical analysis), 131-137 (ballot fraud Dominion System); and all federal Exhibits 1 - 19.

[2] Cities, town and villages are individual municipalities charged with administering elections. Secs. 5.02(11), 5.25(2), Stats. According to the Wisconsin League of Municipalities and Wisconsin Dept. of Health Services, there are approximately 1,912 individual such municipalities.
https://www.lwm-info.org/590/Facts-About-Wisconsin-Municipalities;
https://www.lwm-info.org/590/Facts-About-Wisconsin-Municipalities

CONCLUSION

Again, the additional parties, procedural issues and delay proposed by Defendants are utterly unnecessary to consideration of Plaintiff's Amended Complaint and supporting Memorandum and determination of Plaintiff's TRO Motion, and are designed solely to deny through delay Plaintiff's access to the courts and remedies to which he and other lawful Wisconsin voters are entitled.

Plaintiff therefore requests the Court to summarily deny Defendant Evers' Motion, immediately order briefing on Plaintiff's TRO motion, and issue its decision no later than 5 p.m. Sunday evening, December 6 so that Plaintiff may have a few hours to prepare for and seek whatever further relief may be then available in the time left.

Respectfully submitted, this 3st day of December 2020.

UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,
and DERRICK VAN ORDEN,

Plaintiffs,

Case No. 20-cv-1771-pp

v.

WISCONSIN ELECTIONS COMMISSION, *et al.*,

Defendants.

ORDER DENYING MOTION TO REASSIGN CASE PURSUANT TO CIVIL L.R. 3(b) (DKT. NO. 16)

On December 1, 2020, plaintiffs William Feehan and Derrick Van Orden filed the complaint in this case, naming as defendants the Wisconsin Elections Commission, Ann S. Jacobs, Mark L. Thomsen, Marge Bostelman, Julie M. Glancey, Dean Knudson, Robert F. Spindell, Jr. and Governor Tony Evers. Id. at 1, 9. Two days later, before the defendants had answered, an amended complaint was filed naming only Feehan as plaintiff; the amended complaint names the same defendants. Dkt. No. 9.

On December 2, 2020, plaintiff Donald J. Trump filed a complaint in the Eastern District of Wisconsin, naming as defendants the Wisconsin Elections Commission, Ann S. Jacobs, Mark L. Thomsen, Marge Bostelman, Dean Knudson, Robert F. Spindell, Jr., Scott McDonell, George L. Christenson, Julietta Henry, Claire Woodall-Vogg, Tom Barrett, Jim Owczarski, Satya Rhodes-Conway, Maribeth Witzel-Behl, Cory Mason, Tara Coolidge, John

Antaramian, Matt Krauter, Eric Genrich, Kris Teske, Douglas J. La Follette and Tony Evers. Trump v. Wisconsin Elections Commission, *et al.*, Case No. 20-cv-1785 (E.D. Wis.). Section VIII of the Form JS 44 Civil Cover Sheet for Case No. 20-cv-1785 is blank; the plaintiff did not identify any related cases. Id. at Dkt. 1-1. Trump v. Wisconsin Elections Commission, *et al.*, Case No. 20-cv-1785 has been assigned to U.S. District Judge Brett H. Ludwig.

On December 3, 2020, Tony Evers—named as a defendant in both this case and Case No. 20-cv-1785—filed in this case a motion to reassign Case No. 20-cv-1785 to this court, citing Civil Local Rule 3(b) (E.D. Wis.). Dkt. No. 16. The defendant states that judicial efficiency and a desire to avoid conflicting opinions motivate the motion, because the "federal safe-harbor date [is] approaching on December 8 and the meeting of the Electoral College [is scheduled] for December 14." Id. at 1. The defendant refers the court to Civil Local Rule 3(b) for the factors to be considered in determining whether actions are related, noting that the rule provides that "the judge to whom the action with the lower-case number is assigned will resolve any dispute as to whether the actions are related." Id.

The defendant asserts that promptly upon learning late in the day on December 2, 2020 of the filing of Case No. 20-cv-1785, defense counsel in this case prepared and filed a notice of related case. Id. He asserts that the notice (attached to the motion) explains that Case No. 20-cv-1785 and this case arise from substantially the same transaction or events—"the administration of the November 3, 2020 Presidential election"—and involve substantially the same

parties.[1] Id. at 1-2. He asserts that both cases seek to overturn the results of the recent election "and in so doing deny more than three million Wisconsinites of their fundamental right to vote." Id. at 2. The defendant concludes by asserting that the two cases are related "within the meaning of Civil Local Rule 3(b)" and asks that the court reassign Case No. 20-cv-1785 to this court. Id.

The court will deny the motion. Civil L.R. 3 is titled "Commencing an Action." Rule 3(a) requires a party filing an action—the plaintiff—to file a Civil Cover Sheet (the Form JS 44). Rule 3(b) says that "[w]here the Civil Cover Sheet discloses a pending related civil action, the new civil action will be assigned to the same judge." The rule provides guidance to help the party who files the civil cover sheet—the plaintiff—determine whether cases are related; it instructs the plaintiff to consider whether the actions arise from substantially the same transaction or events or whether they involve substantially the same parties or property; it allows the plaintiff to identify on the Civil Cover Sheet any cases the plaintiff believes are related. Once the plaintiff has identified related cases, it provides that the clerk's office "will" assign the related cases to the same judge. It anticipates that some party other than the plaintiff might disagree that the cases are related, and provides that if any such disputes arise, the judge to whom the related cases are assigned will settle them. The rule does *not* provide a mechanism for any party other than the plaintiff to file a motion

[1] The two cases have different plaintiffs; among the twenty-two defendants in Case No. 20-cv-1785 are seven of the eight defendants named in this case.

asking for reassignment of cases based on the party's view that cases are related.

Contrast Criminal Local Rule 13 (E.D. Wis.), titled "Reassignment of Related Criminal Cases," which does provide a mechanism for reassignment. Rule 13(b) states that "[a] motion for reassignment based on relatedness may be filed by any party to a case." It requires the moving party to file the motion with the judge to whom the lowest numbered case of the claimed related set is assigned and requires that judge to decide the motion. Rule 13(a) lays out the conditions precedent to reassignment. While Criminal L.R. 13 expressly authorizes any party to file a motion seeking reassignment of cases that party believes to be related, there is no equivalent civil local rule.

Civil L.R. 3(b) does not authorize the relief the defendant requests.

The court **DENIES** the defendant's motion to reassign case pursuant to Civil L.R. 3(b). Dkt. No. 16.

Dated in Milwaukee, Wisconsin this 3rd day of December, 2020.

No. 2:20-cv-1771

MOTION TO INTERVENE OF PROPOSED INTERVENOR-DEFENDANT DEMOCRATIC SERVICES CORPORATION/DEMOCRATIC NATIONAL COMMITTEE (THE "DNC")

Proposed Intervenor-Defendant Democratic Services Corporation/Democratic National Committee ("DNC") respectfully moves for leave to intervene in this action to defend its interests against the claims asserted by Plaintiffs. For the reasons discussed in the accompanying memorandum in support, the DNC is entitled to intervene in this case as a matter of right under Federal Rule of Civil Procedure 24(a)(2). In the alternative, the DNC requests permissive intervention pursuant to Rule 24(b). In accordance with Rule 24(c), a proposed answer to Plaintiff's complaint is attached as Exhibit 1.

WHEREFORE, the DNC requests that the court grant it leave to intervene in the above-captioned matter.

DEMOCRATIC NATIONAL COMMITTEE,

Proposed Intervenor-Defendants.

PROPOSED INTERVENOR-DEFENDANT DEMOCRATIC NATIONAL COMMITTEE'S PROPOSED ANSWER TO AMENDED COMPLAINT FOR DECLARATORY, EMERGENCY, AND PERMANENT INJUNCTIVE RELIEF

Proposed Intervenor-Defendant Democratic Services Corporation/Democratic National Committee (the "DNC"), by and through its attorneys, answers Plaintiff's amended complaint for declaratory, emergency, and permanent injunctive relief ("complaint") as set forth below. Unless expressly admitted, each allegation in the complaint is denied, and DNC demands strict proof thereof.

Introduction

1. Paragraph 1 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 1.

2. Paragraph 2 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 2.

3. Paragraph 3 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 3.

4. Paragraph 4 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 4.

5. Paragraph 5 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 5.

6. Paragraph 6 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 6.

7. Paragraph 7 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 7.

8. Paragraph 8 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required,

DNC denies the allegations of Paragraph 8.

9. Paragraph 9 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 9.

10. Paragraph 10 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 10.

11. Paragraph 11 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 11.

12. Paragraph 12 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 12.

13. Paragraph 13 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 13.

14. Paragraph 14 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 14.

15. Paragraph 15 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 15.

16. Paragraph 16 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a

response is required, DNC denies the allegations of Paragraph 16.

17. Denied.

Jurisdiction and Venue

18. In response to Paragraph 18 of Plaintiff's complaint, DNC denies that this Court has subject-matter jurisdiction.

19. In response to Paragraph 19 of Plaintiff's complaint, DNC denies that this Court has subject-matter jurisdiction.

20. DNC denies Paragraph 20 of Plaintiff's complaint because the Court lacks subject-matter jurisdiction.

21. DNC denies Paragraph 21 of Plaintiff's complaint because the Court lacks subject-matter jurisdiction.

22. DNC denies that venue is proper in the Eastern District of Wisconsin.

23. Paragraph 23 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 22.

Parties

24. In response to paragraph 24 of Plaintiff's complaint, Intervenor DNC lacks knowledge or information sufficient to form a belief as to the truth of these allegations, and they are therefore denied.

25. DNC admits that Paragraph 24 quotes from *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020). The remainder of Paragraph 24 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the remaining allegations of

Paragraph 25.

26. Denied.

27. DNC admits that the results of the November 2020 Wisconsin election on November 30 indicated a plurality for President-Elect Biden. The remainder of Paragraph 27 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the remainder of allegations of Paragraph 27.

28. DNC admits the allegations of Paragraph 28.

29. DNC admits the allegations of Paragraph 29.

30. DNC admits that the Wisconsin Elections Commission was created in 2015. The remainder of Paragraph 30 contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the remainder of allegations of Paragraph 30.

31. In response to Paragraph 31, DNC admits that Wis Stat. § 7.20 governs the establishment of municipal and county boards of election commissioners in cities over 500,000 population and counties over 750,000 population, respectively. The remainder of Paragraph 31 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the remainder of allegations of Paragraph 31.

Statement of Facts

32. DNC admits that Plaintiff purports to bring this action under 42 U.S.C. §§ 1983 and 1988. The remainder of Paragraph 32 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 32.

33. DNC admits that Paragraph 33 of the complaint accurately quotes the United States constitution. The remainder of Paragraph 33 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 33.

34. Paragraph 34 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 34.

35. DNC denies the allegations of Paragraph 35. The margin of victory for President-Elect Biden was 20,682 votes.

36. Denied.

I. "VIOLATIONS OF WISCONSIN ELECTION CODE"

37. Paragraph 37 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 37.

38. Paragraph 38 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 38.

39. Paragraph 39 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 39.

40. Paragraph 40 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 40.

41. Paragraph 41 of Plaintiff's complaint contains mere characterizations, legal

contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 41.

42. Paragraph 42 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 42. DNC specifically denies that any Wisconsin voter in the 2020 Presidential Election claimed they were indefinitely confined in any way inconsistent with the Wisconsin's election laws.

43. Paragraph 43 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 43.

44. In response to paragraph 44 of Plaintiff's complaint, Intervenor DNC lacks knowledge or information sufficient to form a belief as to the truth of these allegations, and they are therefore denied. In addition, Paragraph 44 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required.

45. In response to paragraph 45 of Plaintiff's complaint, Intervenor DNC lacks knowledge or information sufficient to form a belief as to the truth of these allegations, and they are therefore denied. In addition, Paragraph 45 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required.

II. "EXPERT WITNESS TESTIMONY"

46. In response to paragraph 46 of Plaintiff's complaint, Intervenor DNC lacks knowledge or information sufficient to form a belief as to the truth of these allegations, and they are therefore denied. In addition, Paragraph 46 of Plaintiff's complaint contains mere

characterizations, legal contentions, conclusions, and opinions to which no response is required.

47. Paragraph 47 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 47.

48. Paragraph 48 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 48.

49. Paragraph 49 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 49.

50. Paragraph 50 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 50.

51. In response to Paragraph 51 of Plaintiff's complaint, Intervenor DNC lacks knowledge or information sufficient to form a belief as to the truth of these allegations, and they are therefore denied. In addition, Paragraph 51 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required.

52. In response to Paragraph 52 of Plaintiff's complaint, Intervenor DNC lacks knowledge or information sufficient to form a belief as to the truth of these allegations, and they are therefore denied. In addition, Paragraph 52 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required.

53. In response to Paragraph 53 of Plaintiff's complaint, Intervenor DNC lacks knowledge or information sufficient to form a belief as to the truth of these allegations, and they are therefore denied. In addition, Paragraph 53 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required.

54. Paragraph 54 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 54.

55. Paragraph 55 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 55.

56. Paragraph 56 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 56.

57. Paragraph 57 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 57.

58. Paragraph 58 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 58.

59. Paragraph 59 of Plaintiff's complaint contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 46.

III. "FACTUAL ALLEGATIONS REGARDING DOMINION VOTING SYSTEMS"

60. DNC lacks sufficient information to confirm or deny the contents of Paragraph 60, and they are therefore denied. Paragraph 60 of Plaintiff's complaint otherwise contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 60.

61. Paragraph 61 of Plaintiff's complaint otherwise contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 61.

62. Paragraph 62 of Plaintiff's complaint otherwise contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 62.

63. Paragraph 63 of Plaintiff's complaint otherwise contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 63.

64. DNC lacks sufficient information to confirm or deny the contents of Paragraph 64, and they are therefore denied. Paragraph 64 of Plaintiff's complaint otherwise contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 64.

65. Paragraph 65 of Plaintiff's complaint otherwise contains mere characterizations, legal contentions, conclusions, and opinions to which no response is required. Judge Amy Totenberg's October 11, 2020 Order in the USDC N.D. Ga. case of *Curling, et al. v. Kemp, et. al*, Case No. 1:17-cv-02989 Doc. No. 964, speaks for itself. To the extent a response is required, DNC denies the allegations of Paragraph 65.

66. Paragraph 66 of Plaintiff's complaint attempts to quote, paraphrase, and/or

interpret a judicial order. To the extent Plaintiff's interpretation differs from the text of the order, DNC denies the allegations. Paragraph 66 of Plaintiff's complaint otherwise contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 66.

67. Paragraph 67 of Plaintiff's complaint attempts to quote, paraphrase, and/or interpret a judicial opinion. To the extent Plaintiff's interpretation differs from the text of the opinion, DNC denies the allegations. Paragraph 67 of Plaintiff's complaint otherwise contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 67.

68. Paragraph 68 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 68.

69. Paragraph 69 of Plaintiff's complaint attempts to quote, paraphrase, and/or interpret a "security advisory." To the extent Plaintiff's interpretation differs from the text of the "advisory," DNC denies the allegations. Paragraph 69 of Plaintiff's complaint otherwise contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 67.

70. Paragraph 70 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 70. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 70, and they are therefore denied.

71. Paragraph 71 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is

required, DNC denies the allegations of Paragraph 71. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 71, and they are therefore denied.

72. Paragraph 72 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 72. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 72, and they are therefore denied.

73. Paragraph 73 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 73. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 73, and they are therefore denied.

74. Paragraph 74 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 74. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 74, and they are therefore denied.

75. Paragraph 75 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 75. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 75, and they are therefore denied.

76. Paragraph 76 of Plaintiff's complaint contains mere legal contentions,

characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 76. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 76, and they are therefore denied.

77. Paragraph 77 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 77.

78. DNC denies the allegations of Paragraph 78.

79. Paragraph 79 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 79. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 79, and they are therefore denied.

80. Paragraph 80 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 80. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 80, and they are therefore denied.

81. Paragraph 81 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 81. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 81, and they are therefore denied.

82. Paragraph 82 of Plaintiff's complaint contains mere legal contentions,

characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 82. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 82, and they are therefore denied.

83. Paragraph 83 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 83. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 83, and they are therefore denied.

84. Paragraph 84 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 84. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 84, and they are therefore denied.

85. Paragraph 85 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 85. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 85, and they are therefore denied.

86. Paragraph 86 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 86. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 86, and they are therefore denied.

87. Paragraph 87 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 87. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 87, and they are therefore denied.

88. Paragraph 88 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 88. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 88, and they are therefore denied.

89. Paragraph 89 of Plaintiff's complaint attempts to quote, paraphrase, and/or interpret H.R. 2722. To the extent Plaintiff's quotation differs from the text of the bill DNC denies the allegation in that respect. Paragraph 69 of Plaintiff's complaint otherwise contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 67.

90. Paragraph 90 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 90. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 90, and they are therefore denied.

91. Paragraph 91 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 91. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 91, and

they are therefore denied.

92. Paragraph 92 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 92. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 92, and they are therefore denied.

93. DNC lacks knowledge or information sufficient to form a belief as to the truth of the allegations in paragraph 93, and they are therefore denied.

94. Paragraph 94 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 94. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 94, and they are therefore denied.

95. Paragraph 95 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 95. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 95, and they are therefore denied.

96. Paragraph 96 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 96. DNC lacks knowledge or information sufficient to form a belief as to the truth of the remaining allegations in paragraph 96, and they are therefore denied.

97. Paragraph 97 of Plaintiff's complaint contains mere legal contentions,

characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 97. DNC otherwise lacks knowledge or information sufficient to form a belief as to the truth of the allegations in paragraph 97, and they are therefore denied.

98. Paragraph 98 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 98.

99. DNC denies the allegations of Paragraph 99.

COUNT I

100. DNC reincorporates all preceding paragraphs as if fully set forth herein.

101. Paragraph 101 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

102. Paragraph 102 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

103. Paragraph 103 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

104. DNC denies the allegations of Paragraph 104.

105. Paragraph 105 of Plaintiff's complaint contains mere legal conclusions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 105. DNC specifically denies that any Wisconsin voter in the 2020 Presidential Election claimed they were indefinitely confined in any way inconsistent with the Wisconsin's election laws.

106. Paragraph 106 of Plaintiff's complaint contains mere legal conclusions to which no response is required. To the extent a response is required, DNC denies the allegations of

Paragraph 106. DNC specifically denies that any Wisconsin voter in the 2020 Presidential Election claimed they were indefinitely confined in any way inconsistent with the Wisconsin's election laws.

107. DNC lacks sufficient information to confirm or deny the allegations of Paragraph 107 and therefore denies.

108. Paragraph 108 of Plaintiff's complaint contains mere legal contentions, characterizations, and opinions to which no response is required. To the extent a response is required, DNC denies the allegations of Paragraph 108. DNC otherwise lacks knowledge or information sufficient to form a belief as to the truth of the allegations in paragraph 108, and they are therefore denied.

109. DNC denies the allegations in Paragraph 109.

110. DNC denies the allegations in Paragraph 110.

COUNT II

111. DNC reincorporates all preceding paragraphs as if fully set forth herein.

112. Paragraph 112 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

113. Paragraph 113 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

114. Paragraph 114 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

115. Paragraph 115 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

116. Paragraph 116 of Plaintiff's complaint contains mere legal conclusions to which no response is required. DNC denies the remaining allegations of Paragraph 116.

117. Paragraph 117 of Plaintiff's complaint contains mere legal conclusions to which no response is required. DNC denies the remaining allegations of Paragraph 117.

118. Paragraph 118 of Plaintiff's complaint contains mere legal conclusions to which no response is required. DNC denies that Plaintiff is entitled to any relief.

119. Paragraph 119 of Plaintiff's complaint contains mere legal conclusions to which no response is required. DNC denies the remaining allegations of Paragraph 119.

120. DNC denies that Plaintiff is entitled to any relief.

121. Paragraph 121 of Plaintiff's complaint contains mere legal conclusions to which no response is required. DNC denies the remaining allegations of Paragraph 121. DNC denies that Plaintiff is entitled to any relief.

COUNT III

122. DNC reincorporates all preceding paragraphs as if fully set forth herein.

123. Paragraph 123 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

124. Paragraph 124 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

125. Paragraph 125 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

126. Paragraph 126 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

127. Paragraph 127 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

128. Paragraph 128 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

129. DNC denies the allegations of Paragraph 129.

130. DNC denies the allegations of Paragraph 130.

COUNT III

131. DNC reincorporates all preceding paragraphs as if fully set forth herein.

132. DNC denies the allegations of Paragraph 132.

133. DNC denies the allegations of Paragraph 133.

134. DNC denies the allegations of Paragraph 134.

135. DNC denies the allegations of Paragraph 135.

136. Paragraph 136 of Plaintiff's complaint contains mere legal conclusions to which no response is required.

137. DNC denies the allegations of Paragraph 137.

Prayer for Relief

138-142. To the extent Plaintiff makes any factual allegations in paragraphs 138 to 142, DNC denies such allegations. DNC denies that Plaintiff are entitled to any relief.

AFFIRMATIVE DEFENSES

DNC asserts the following affirmative defenses without accepting any burdens regarding them and reserves the right to assert any further defenses that may become evident during the pendency of this matter:

First Affirmative Defense

Plaintiff lacks standing to assert their claims.

Second Affirmative Defense

The Complaint fails, in whole or in part, to state a claim upon which relief can be granted.

Third Affirmative Defense

Plaintiff's claims are barred by laches.

Fourth Affirmative Defense

The Complaint is barred in whole or in part by the doctrine of abstention.

Fifth Affirmative Defense

The Plaintiff is estopped and/or equitably estopped from bringing some or all of the claims asserted in the action.

Sixth Affirmative Defense

Plaintiff's complaint fails to state a claim for relief that is plausible on its face.

Seventh Affirmative Defense

Plaintiff's claims are barred by the doctrine of illegality.

Eighth Affirmative Defense

Plaintiff's have waived the right to bring some or all of their claims.

Ninth Affirmative Defense

Plaintiff's unclean hands preclude relief.

Tenth Affirmative Defense

Plaintiff's claims are barred in whole or in part by the doctrine of res judicata.

PROPOSED INTERVENOR'S REQUEST FOR RELIEF

Having answered Plaintiff's complaint, DNC requests that the Court:

1. Deny Plaintiff is entitled to any relief;
2. Dismiss Plaintiff's complaint in its entirety with prejudice;
3. Award DNC its costs and attorneys' fees incurred in defending against Plaintiff's claims in accordance with 42 U.S.C. § 1988; and
4. Grant such other and further relief as this Court deems just and proper.

DATED: December 4, 2020

Respectfully Submitted,

s/ Michelle M. Umberger

CERTIFICATE OF SERVICE

I hereby certify that on Friday, December 4, 2020, I filed a copy of the foregoing with the Clerk of the Court using the CM/ECF system, which will send notification of such filing to all counsel of record.

/s/ Michelle M. Umberger
Counsel for Proposed Intervenor

IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff,

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMANN, JULIE M. GLANCEY, DEAN HUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

No. 2:20-cv-1771

[PROPOSED] ORDER GRANTING PROPOSED INTERVENOR-DEFENDANT DEMOCRATIC NATIONAL COMMITTEE'S MOTION TO INTERVENE

Before the Court is Proposed Intervenor-Defendant Democratic Services Corporation/Democratic National Committee's ("DNC") Motion to Intervene. Having reviewed the papers filed in support of and in opposition to (if any) this motion, and being fully advised, the Court finds that that the DNC has satisfied the elements of intervention as of right and the elements of permissive intervention. Accordingly, the DNC is entitled to intervene in this case, and the Court GRANTS the DNC's motion.

It is so **ORDERED.**

BY THE COURT:

HON. PAMELA PEPPER
Chief United States District Judge

UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN, Plaintiff, v. WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMANN, JULIE M. GLANCEY, DEAN HUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity, Defendants.	No. 2:20-cv-1771

PROPOSED INTERVENOR-DEFENDANT DEMOCRATIC NATIONAL COMMITTEE'S BRIEF IN SUPPORT OF MOTION TO INTERVENE

I. Introduction

Pursuant to Federal Rule of Civil Procedure 24, Proposed Intervenor Defendant DNC Services Corporation/Democratic National Committee ("DNC") moves to intervene as a defendant in this lawsuit. Through this lawsuit, Plaintiffs seek to undo Wisconsin's lawful certification of the election results. They base their requested relief on, among other things, speculation, questionable evidence, and flawed legal theories. The DNC represents a diverse group of Democrats, including elected officials, candidates, constituents, and voters. The extraordinary relief Plaintiffs request would deprive the DNC's members and constituents of their rights to have their votes counted, undermine the electoral prospects of the DNC's candidates, and divert the DNC's resources. The DNC's intervention in this lawsuit is necessary to protect those interests.

Pursuant to Rule 24(c) a conditional answer is attached to Exhibit 1.[1]

II. Argument

A. The DNC is entitled to intervene as of right.

The DNC is entitled to intervene as of right because (1) its "motion is timely"; (2) the DNC "has an interest relating to the property or transaction at issue in the litigation"; and (3) "that interest may, as a practical matter, be impaired or impeded by disposition of the case." *Driftless Area Land Conservancy v. Huebsch*, 969 F.3d 742, 746 (7th Cir. 2020). Further, no "existing part[y] adequately represent[s]" the DNC's interests. *Id.* (emphasis omitted).

1. The motion to intervene is timely.

First, this motion is timely. In considering whether a motion to intervene is timely, courts consider, among other things, "(1) the length of time the intervenor knew or should have known of his interest in the case" and "(2) the prejudice caused

[1] The DNC intends to file a motion to dismiss. But to comply with Rule 24(c), and in the event this Court denies the DNC's forthcoming motion to dismiss, the DNC has submitted a proposed, conditional answer.

to the original parties by the delay." *State v. City of Chicago*, 912 F.3d 979, 984 (7th Cir. 2019) (quoting *Grochocinski v. Mayer Brown Rowe & Maw, LLP*, 719 F.3d 785, 797 (7th Cir. 2013)).

In this case, the DNC is filing its motion to intervene just two days after plaintiffs filed this lawsuit. The DNC has thus "move[d] to intervene as soon as it" knew "its interests might be adversely affected by the outcome of the litigation." *Heartwood, Inc. v. U.S. Forest Serv., Inc.*, 316 F.3d 694, 701 (7th Cir. 2003). No defendant has yet filed a response to Plaintiffs' complaint. And the DNC is prepared to proceed in accordance with whatever schedule this Court sets. Thus, intervention by the DNC will neither delay the resolution of this matter nor prejudice any party. Under these circumstances, the motion is timely.

2. The DNC has significant interests at stake in this litigation.

Second, the DNC has a "direct, significant, and legally protectable" interest in this litigation that supports its intervention. *Solid Waste Agency of N. Cook Cty. v. U.S. Army Corps of Engineers*, 101 F.3d 503, 506 (7th Cir. 1996). The rules for mandatory intervention "do[] not define 'interest.'" *Lopez-Aguilar v. Marion Cty. Sheriff's Dep't*, 924 F.3d 375, 391 (7th Cir. 2019). But, the "standing inquiry," gives content to its meaning, as the Seventh Circuit has "required 'more than the minimum Article III interest' for intervention.'" *Planned Parenthood of Wisconsin, Inc. v. Kaul*, 942 F.3d 793, 798 (7th Cir. 2019) (quoting *Flying J, Inc. v. Van Hollen*, 578 F.3d 569, 571 (7th Cir. 2009)). At the same time, the Seventh Circuit has "interpreted 'statements of the Supreme Court as encouraging liberality in the definition of an interest.'" *Lopez-Aguilar*, 924 F.3d at 392 (quoting *Meridian Homes Corp. v. Nicholas W. Prassas & Co.*, 683 F.2d 201, 204 (7th Cir. 1982)).

The DNC has several significant, protectable interests at stake in this lawsuit, each of which justify its intervention. First, Plaintiffs seek to disrupt the certification of Wisconsin's November 3, 2020 Presidential election results and to cast doubt on

the entitlement of the Democratic Party's candidates for President and Vice-President to Wisconsin's ten electoral votes. Interference with a political party's electoral prospects constitutes constitutional injury. *See, e.g.*, *Tex. Democratic Party v. Benkiser*, 459 F.3d 582, 586–87 (5th Cir. 2006) (holding that a "basis for the [Texas Democratic Party's] direct standing is harm to its election prospects" and that "a political party's interest in a candidate's success is not merely an ideological interest"); *Owen v. Mulligan*, 640 F.2d 1130, 1132 (9th Cir. 1981) (holding that "the potential loss of an election" is sufficient injury to confer Article III standing). Courts have permitted political parties to intervene on these grounds. *See, e.g.*, *Issa v. Newsom*, No. 220CV01044MCECKD, 2020 WL 3074351, at *3 (E.D. Cal. June 10, 2020) (granting intervention of state party where "Plaintiffs' success on their claims would disrupt the organizational intervenors' efforts to promote the franchise and ensure the election of Democratic Party candidates" (quoting *Paher v. Cegavske*, No. 320CV00243MMDWGC, 2020 WL 2042365, at *2 (D. Nev. Apr. 28, 2020))).

Further, Plaintiffs' requested relief of de-certifying the election would have significant disenfranchising effects on the DNC's constituents. *See Crawford v. Marion Cty. Election Bd.*, 553 U.S. 181, 189 n.7 (2008) (agreeing with the unanimous view of the Seventh Circuit that the Indiana Democratic Party had Article III standing to challenge a voter identification law that risked disenfranchising its members). This, in turn, would require the DNC to divert resources to safeguard the timely certification of statewide results. *See Crawford v. Marion Cnty. Election Bd.*, 472 F.3d 949, 951 (7th Cir. 2007) (concluding that challenge law "injure[d] the Democratic Party by compelling the party to devote resources" that it would not have needed to devote absent new law), *aff'd*, 553 U.S. 181 (2008); *see also Issa*, 2020 WL 3074351, at *3 (granting intervention and citing this interest).

As a result, the DNC's injuries are direct and significant and support its intervention.

3. Denial of the motion to intervene would impair the DNC's ability to protect its interests.

Next, the DNC's interests "may, as a practical matter, be impaired or impeded by disposition of the case." *Driftless Area Land Conservancy*, 969 F.3d at 746. When, as here, a proposed intervenor has a protectable interest in the outcome of the litigation, courts have "little difficulty concluding" that its interests will be impaired. *Citizens for Balanced Use v. Montana Wilderness Ass'n*, 647 F.3d 893, 898 (9th Cir. 2011) (quoting *California ex rel. Lockyer v. United States*, 450 F.3d 436, 442 (9th Cir. 2006)). When considering this factor, courts examine the "practical consequences" of denying intervention. *Nuesse v. Camp*, 385 F.2d 694, 702 (D.C. Cir. 1967); Advisory Comm. to Fed. R. Civ. P. 24 1966 Amendment ("If an absentee would be substantially affected in a practical sense by the determination made in an action, he should, as a general rule, be entitled to intervene. . . .").

As set forth above, there can be little doubt that if Plaintiffs were to succeed in decertifying the election, the DNC "would be directly rather than remotely harmed." *Flying J, Inc. v. Van Hollen*, 578 F.3d 569, 572 (7th Cir. 2009). The relief Plaintiffs seek—decertification of the election—would threaten the DNC's electoral prospects, disenfranchise the DNC's members, and otherwise harm the DNC's mission. Courts have frequently permitted political parties to intervene in similar circumstances. *See, e.g.*, *Paher v. Cegavske*, No. 20-00243-MMD-WGC, 2020 WL 2042365, at *4 (D. Nev. Apr. 28, 2020) (granting DNC intervention in election case regarding election procedures and recognizing impairment of DNC's interests); *see also Issa*, 2020 WL 3074351, at *3 (recognizing impairment of state party's interests in lawsuit regarding election procedures).

4. The DNC's interests are not adequately represented by the existing parties.

Finally, the DNC's interests are not adequately represented by the existing parties. *Driftless Area Land Conservancy*, 969 F.3d at 747. The Seventh Circuit

employs a tiered approach to "evaluating adequacy of representation." *Id.* at 747. "'The default rule . . . is a liberal one.'" *Id.* (quoting *Planned Parenthood of Wisconsin, Inc.*, 942 F.3d at 799). It requires a 'minimal" burden of showing that representation "'may be' inadequate." *Id.* (quoting *Trbovich v. United Mine Workers of Am.*, 404 U.S. 528, 538 n.10 (1972)). A more stringent showing is required "if the interest of the absentee is identical to that of an existing party, or if a governmental party is charged by law with representing the absentee's interest." *Id.* Ultimately, examination of this factor "calls for a contextual, case-specific analysis, and resolving questions about the adequacy of existing representation requires a discerning comparison of interests." *Id.* at 748.

In this case, the Defendants and the DNC have "interests and objectives that are materially different" from each other. *Id.* at 749. The Defendants have an interest in defending the actions of state officials. The DNC has different objectives: ensuing that the valid ballot of every Democratic voter in Wisconsin is counted and safeguarding the election of Democratic candidates. Ultimately, the DNC has specific interests and concerns—including the Democratic Party's overall electoral prospects and use of their limited resources—that none of the current Defendants share. Considering these material differences in objectives, no heightened burden of showing of inadequacy is required.[2] *Id.* And the DNC has met the "minimal" burden of showing that the Defendants' "representation 'may be' inadequate." *Id.* (quoting *Trbovich*, 404 U.S. at 538 n.10).

[2] Further, the Wisconsin Elections Commission and Governor are not "charged by law with protecting the interests of the proposed intervenors," the DNC. *Planned Parenthood of Wisconsin, Inc.*, 942 F.3d at 799; *see also Wisconsin Educ. Assn Council v. Walker*, 705 F.3d 640, 659 (7th Cir. 2013) (finding that, in challenge to constitutionality of statute related to unions, the Governor and other state officials were "not charged by law" with protecting interests of employees seeking to intervene in defense of the statute).

Indeed, other courts have held that such divergent interests between government defendants and others warrant intervention. *See, e.g.*, *Kleissler v. U.S. Forest Serv.*, 157 F.3d 964, 972 (3d Cir. 1998) (recognizing that intervention may be appropriate when "an agency's views are necessarily colored by its view of the public welfare rather than the more parochial views of a proposed intervenor"); *see also, e.g.*, *Issa*, 2020 WL 3074351, at *3 (granting intervention and observing that the interests of officials were to "properly administer election laws," in contrast to the interests of a state party, which included "ensuring their party members and the voters they represent have the right to vote," "advancing their electoral prospects," and "allocating their limited resources"); *Paher*, 2020 WL 2042365, at *3 (granting intervention as of right where proposed intervenors, including the DNC, "may present arguments about the need to safeguard [the] right to vote that are distinct from [state defendants'] arguments").

B. The DNC is also entitled to permissive intervention.

If the Court does not grant intervention as a matter of right, the DNC respectfully requests that the Court exercise its discretion to allow it to intervene under Rule 24(b). The Court has discretion to grant a motion for permissive intervention when the Court determines that: (1) the proposed intervenor's claim or defense and the main action have a "common question of law or fact," and (2) the intervention will not "unduly delay or prejudice the adjudication of the original parties' rights." Fed. R. Civ. P. 24(b)(1)(B) and (b)(3); *see also Planned Parenthood of Wisconsin, Inc.*, 942 F.3d at 803 (discussing the district court's broad discretion in granting permissive intervention).

The DNC meets the criteria for permissive intervention. The motion to intervene is timely and, given that this litigation is at a very early stage, intervention will not unduly delay or prejudice the adjudication of the original parties' rights. Moreover, the DNC will inevitably raise common questions of law and fact, including

challenging Plaintiffs' claims that the lawful votes of Wisconsin voters should be invalidated. The DNC would contribute to the complete development of the factual and legal issues before this Court and is "uniquely qualified to represent the 'mirror-image' interests" of the Plaintiff. *See Democratic Nat'l Comm. v. Bostelmann,* No. 20-CV-249-WMC, 2020 WL 1505640, at *5 (W.D. Wis. Mar. 28, 2020) (denying Republican National Committee's motion to intervene as a matter of right but granting permissive intervention because the RNC represented "the 'mirror-image' interests" of the plaintiffs).

III. Conclusion

For the reasons stated above, this Court should grant the DNC's motion to intervene as a matter of right. In the alternative, this Court should exercise its direction and grant the DNC permissive intervention.

DATED: December 4, 2020.

Case No.: 20CV1771

DEFENDANT GOVERNOR EVERS'S REPLY TO PLAINTIFF'S PROPOSED BRIEFING SCHEDULE

On Thursday, December 3, 2020, Plaintiff William Feehan filed an Amended Motion for Temporary Restraining Order and Preliminary Injunction To Be Considered in an Expedited Manner (Dkt. 10), which included a Proposed Briefing Schedule (Dkt. 10-1). Several hours later, counsel met and conferred about the proposed schedule but were unable to reach agreement. Subsequent to that meet-and-confer session, one individual and one entity have moved to intervene in this matter.

In the absence of an agreed schedule among the parties, Defendant Tony Evers proposes the following expedited schedule:

Monday, Dec. 7 at 5:00 p.m. Defendants/Intervenors oppositions to TRO motion[1]

[1] Governor Evers's brief will address not only the merits of Plaintiff's motion, but also threshold questions of justiciability.

Tuesday, Dec. 8 at 5:00 p.m.	Plaintiff replies to opposition briefs
At the Court's discretion	Court holds an evidentiary hearing and legal argument (if deemed necessary)

This proposed schedule will significantly expedite resolution of Plaintiff's claims, though Plaintiff has no one to blame but himself for the time-crunch that he cites as justification for imposing impossible deadlines.[2] This proposed schedule also seeks to balance the resources to be devoted to this case with those necessary for litigating the parallel case filed in this Court by President Trump[3] and any state-court proceedings challenging the results of Wisconsin's election ongoing[4] or that may arise.

Should the Court wish to hear more on this topic, counsel for Governor Evers will gladly make themselves available at the Court's convenience for a scheduling conference.

Respectfully submitted this 4th day of December 2020.

Attorneys for Defendant, Governor Tony Evers

[2] Plaintiff asserts that his motion needs to be adjudicated before the electors meet. (Dkt. 18 at *2) Since that meeting is not until December 14, *see* 3 U.S.C. § 7 and Wis. Stat. § 7.75, the Governor's proposed schedule satisfies that measure.

[3] *Trump v. Wis. Elections Comm'n, et al.*, Case No. 2:2020-CV-1785 (E.D. Wis., filed December 2, 2020). Plaintiff in that case has also filed an emergency motion for preliminary injunctive relief. Judge Ludwig is convening a telephonic scheduling conference at 1:00 p.m. on Friday, December 4, 2020, to set deadlines in that matter.

[4] *Wis. Voters Alliance v. Wis. Elections Comm'n, et al.,* Case No. 2020AP1930-OA (Wis.) (petition for original jurisdiction in the Wisconsin Supreme Court pending).

IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff,

v. Case No. 20-CV-1771

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

WISCONSIN ELECTIONS COMMISSION AND ITS MEMBERS' RESPONSE TO PLAINTIFF'S PROPOSED BRIEFING SCHEDULE

Defendants Wisconsin Elections Commission and its members submit this response to Plaintiff's proposed briefing schedule on its motion for a temporary restraining order or, in the alternative, a preliminary injunction. Plaintiff proposes that Defendants be ordered to file a response to the motion by Friday, December 4, at 8:00 p.m., that Plaintiff file a reply by Saturday, December 5, at 8:00 p.m., and that this Court issue a decision by Sunday, December 6, at 5:00 p.m. (Dkt. 10-1; 18.) To justify this incredibly short timeline, Plaintiff asserts that he needs a decision by no later than December

6 so that he can "prepare for and seek whatever further relief may be then available in the one day left before the December 8 meeting of electors." (Dkt. 18:2.)

But, even if that meeting had any relevance to this lawsuit, no such exigency would exist because the meeting of electors does not occur until December 14, 2020. *See* Wis. Stat. § 7.75(1) ("The electors for president and vice president shall meet at the state capitol following the presidential election at 12:00 noon the first Monday after the 2nd Wednesday in December."). In any event, any exigency is of the Plaintiff's own making, as they have chosen to wait to bring their claims until eleventh hour.

A more reasonable timeframe for Defendants to respond to Plaintiffs' voluminous filings—an amended complaint, exhibits, and TRO filings totaling nearly 400 pages—would be as follows:

- Defendants file a response brief by Tuesday, December 8, at 11:59 p.m.
- Plaintiff files a reply brief by Wednesday, December 9, at 11:59 p.m.

That schedule, while still extremely abbreviated, would at least give Defendants a reasonable time to respond to the amended complaint and accompanying documents that Plaintiff filed the morning of December 3, a day before he asks Defendants to file substantive responses.

Dated this 4th day of December, 2020.

v.

WISCONSIN ELECTIONS COMMISSION, *et al.*,

Defendants.

ORDER GRANTING IN PART AND DEFERRING RULING IN PART ON AMENDED MOTION FOR TEMPORARY RESTRAINING ORDER AND PRELIMINARY INJUNCTION TO BE HEARD IN AN EXPEDITED MANNER (DKT. NO. 10)

At 10:30 a.m. on December 3, 2020, the plaintiff filed an "Amended Motion For Temporary Restraining Order And Preliminary Injunction To Be Considered In An Expedited Manner." Dkt. No. 10. The amended motion seeks a temporary restraining order or, in the alternative, a preliminary injunction, "to be considered in an expedited manner." Id. at 1. It states that the motion is being submitted pursuant to Fed. R. Civ. P. 65 "and Civil L.R. 7." Id.

The motion asserts that the plaintiff will suffer irreparable harm if the court does not grant a temporary restraining order. Id. at 2. The plaintiff states that he will suffer irreparable harm if various actions he describes "are not immediately enjoined across the state of Wisconsin pursuant to 52 U.S.C. § 20701 (preservation of voting records)" to prevent destruction or alteration of evidence. Id. at ¶5. He asserts that the amended complaint (Dkt. No. 9, filed

the same day as this motion) and the motion present "material dispositive issues which are questions of law that may be resolved without factual investigation or determination." Id. at ¶6.

The plaintiff attached to the motion a proposed briefing schedule. Dkt. No. 10-1. The schedule indicates that the plaintiff's counsel had conferred with defense counsel (and planned to speak with them again later that day) and anticipated proposing that the defendants file their response to the motion for injunctive relief by 8:00 p.m. on Friday, December 4, 2020, that the plaintiff file his reply by 8:00 p.m. on Saturday, December 5, 2020 and that the schedule conclude with a "[h]earing as directed by the Court. Plaintiff proposes to submit the matter on briefs without argument." Id. at 1. Neither the amended motion nor the briefing schedule indicated whether the plaintiff needed a decision from the court by a date certain.

At 5:13 p.m. on December 3, the plaintiff filed a brief in opposition to defendant Tony Evers's motion to reassign Trump v. Wisconsin Elections Commission, *et al.*, Case No. 20-cv-1785, from U.S. District Court Judge Brett H. Ludwig to this court. Dkt. No. 18. The brief stated that "[w]ith the College of Electors scheduled to meet December 8, there could never be a clearer case of 'justice delayed is justice denied.'" Id. at 1. The plaintiff stated that the court should deny the motion to reassign and "immediately order briefing and issue its decision no later than 5 p.m. Sunday evening, December 6 so that Plaintiff may have even a few hours to prepare for and seek whatever further relief may

be then available in the one day left before the December 8 meeting of electors." Id. at 2.

The plaintiff reported that the parties had met and conferred regarding a briefing schedule for the motion for injunctive relief, but that the defendants had "refused to agree to the schedule proposed by Plaintiffs, and in fact, refused to offer a proposed schedule of their own," indicating that they would be seeking reassignment of Case No. 20-cv-1785. Id. at 3. The plaintiff said the defendants also indicated that they could not stipulate to a TRO "to preserve electronic and physical data, materials, and equipment (voting machines in particular) for inspection by Plaintiff's experts" because the defendants said they had "no control or influence whatsoever over preservation of evidence by local jurisdictions and elections clerks." Id. The plaintiff concluded the brief by reiterating his request that the court immediately order briefing and that the court issue its decision no later than 5:00 p.m. Sunday evening, December 6.

First thing on December 4, 2020, defendant Tony Evers responded to the request for an expedited briefing schedule. Dkt. No. 25. The defendant noted that although the plaintiff had asserted that the court needed to decide the motion before the electors meet, that meeting was not scheduled until December 14. Id. at 2 n.2. The defendant proposed an alternative schedule by which the defendants would file their briefs in opposition to the motion for injunctive relief by 5:00 p.m. on Monday, December 7; the plaintiff would file his reply brief by 5:00 p.m. on Tuesday, December 8; and the court could

exercise its discretion regarding whether to hold an evidentiary hearing or hear argument. Id. at 1-2.

Minutes later, defendants the Wisconsin Elections Commission and its members filed their brief in opposition to the request for an expedited briefing schedule. Dkt. No. 26. They, too, stated that the meeting of electors will not take place until December 14, 2020. Id. at 26. They propose a schedule whereby the defendants will file their opposition briefs to the motion for injunctive relief by 11:59 p.m. on Tuesday, December 8, 2020 and the plaintiff will file his reply brief by 11:59 p.m. on Wednesday, December 9, 2020. Id. at 2,

In seeking an expedited briefing schedule, the plaintiff's December 3, 2020 amended motion for injunctive relief cites Civil Local Rule 7 (E.D. Wis.), but identifies no subsection of that rule. Rule 7(b) gives a non-moving party twenty-one days to respond to a motion and Rule 7(c) gives the moving party fourteen days to reply. Given the plaintiff's repeated use of the word "expedited" and the briefing schedule he proposes, the court concludes that he is asking the court for shorter turnaround time than that provided in Rules 7(b) and (c).

There *is* a provision of Civil L.R. 7 that allows a party to seek expedited briefing. Civil L.R. 7(h), which allows a party to seek non-dispositive relief by expedited motion if the party designates the motion as a "Civil L.R. 7(h) Expedited Non-Dispositive Motion." When the court receives a motion with that designation, it may schedule the motion for a hearing or decide the motion on the papers and may order an expedited motion schedule. Civil L.R. 7(h)(1). The

rule limits such motions to three pages in length, requires the respondent to file its three-page opposition memorandum within seven days unless the court orders otherwise and allows the respondent to attach an affidavit or declaration of no more than two pages. Civil L.R. 7(h)(2).

Although the plaintiff did not designate it as such, the court construes the plaintiff's request for the motion for injunctive relief to be heard in an "expedited manner"—Dkt. No. 10—as a Civil L.R. 7(h) Expedited Non-Dispositive Motion for an Expedited Briefing Schedule. The court will grant that motion (although it will not order the briefing schedule the plaintiff suggests).

The other part of the plaintiff's motion seeks immediate temporary injunctive relief—a temporary restraining order or a preliminary injunction. The motion states that the amended complaint and the motion "present material dispositive issues which are questions of law that may be resolved without factual investigation or determination." Dkt. No. 10 at 3. The plaintiff never has requested a hearing, either in writing or by contacting chambers by phone with the adverse parties on the line. The anticipated briefing schedule the plaintiff attached to the amended motion for injunctive relief, while mentioning a hearing "as directed by the Court," states that the plaintiff proposes to "submit the matter on briefs without argument." Dkt. No. 10-1 at 1. In his brief in opposition to a motion to reassign another case, the plaintiff proposes briefing through the weekend and a ruling from this court on Sunday evening; because court generally is not in session on weekends, the court deduces that the plaintiff does not anticipate a hearing on the motion.

The United States Supreme Court has held that injunctive relief is "an extraordinary remedy that may only be awarded upon a clear showing that the plaintiff is entitled to such relief." Winter v. Nat. Res. Defense Counsel, Inc., 555 U.S. 7, 22 (2008) (citing Mazurek v. Armstrong, 520 U.S. 968, 972 (1997)). Because it is an extraordinary remedy, injunctive relief never is awarded as of right. Id. (citing Munaf v. Geren, 553 U.S. 674, 689-90 (2008)). Courts considering requests for such extraordinary relief must, in every case, "balance the competing claims of injury and must consider the effect on each party of the granting or withholding of the requested relief." Id. (quoting Amoco Prod. Co. v. Gambell, 480 U.S. 531, 542 (1987)).

In this court's experience it is unusual for a party seeking the extraordinary remedy of preliminary injunctive relief to ask the court to issue a decision on the pleadings, without presentation of evidence or argument. But because that is what the plaintiff—the movant—has asked, the court will rule on the pleadings.

As for the expedited briefing schedule, the schedule the plaintiff has proposed severely limits the time available to the defendants to respond to his pleadings and to the court to rule. The plaintiff created this limitation by waiting two days to confer with defense counsel and by waiting until late yesterday afternoon to mention a date by which it appears he seeks a ruling from the court. The court disagrees that the plaintiff will be denied his right to redress if the court does not rule by Sunday evening, December 6.

The plaintiff stated in his opposition brief to the motion to reassign that time was of the essence because the College of Electors was scheduled to meet December 8. Dkt. No. 18 at 1. That is not correct. According to an October 22, 2020 white paper from the Congressional Research Service titled "The Electoral College: A 2020 Presidential Election Timeline," the electors will meet and vote on December 14, 2020. https://crsreports.congress.gov/product/pdf/IF/IF11641.

December 8, 2020—six days prior to the date the College of Electors is scheduled to meet—is the "safe harbor" deadline under 3 U.S.C. §5. That statute provides that if a state has provided, "by laws enacted prior to the day fixed for the appointment of the electors, for its final determination of any controversy or contest concerning the appointment of all or any of the electors of such State," and that final determination has been made "at least six days before the time fixed for the meeting of the electors," that determination—if it is made under the state's law at least six days prior to the day the electors meet—"shall be conclusive, and shall govern in the counting of the electoral votes as provided in the Constitution . . . ." Wisconsin has enacted such a law. It is Wis. Stat. §9.01. That statute provides for an aggrieved candidate to petition for a recount. It provides specific procedures for the recount, as well as appeal to the circuit court and the court of appeals. Wis. Stat. §9.01(11) states that it is "the exclusive judicial remedy for testing the right to hold an elective office as the result of an alleged irregularity, defect or mistake committed during the voting or canvassing process."

It appears, therefore, that December 8 is a critical date for resolution of any *state court* litigation involving an aggrieved candidate who is contesting the outcome of an election. The state courts[1] either will or will not resolve allegations of violations of Wis. Stat. §9.01 by the December 8, 2020 "safe harbor" deadline. The plaintiff has not explained why it is necessary for this federal court to grant or deny the injunctive relief he seeks—orders requiring the defendants to de-certify the election results; enjoining defendant Evers from transmitting certified election results to the Electoral College; requiring defendant Evers to transmit certified election results stating that President Donald Trump is the winner of the election; seizing and impounding voting machines, ballots and other election materials; requiring production of security camera recordings for voting facilities—before the safe harbor deadline for *state* courts to resolve alleged violations of Wis. Stat. §9.01.

Because the electors do not meet and vote until December 14, 2020, the court will impose a less truncated briefing schedule than the one the plaintiff proposes, to give the defendants slightly more time to respond. The court will require the defendants to file their opposition brief to the Plaintiff's Amended Motion for Temporary Restraining Order and Preliminary Injunction to be Considered in an Expedited Manner (Dkt. No. 10) by 5:00 p.m. on **Monday, December 7, 2020.** The court will require the plaintiff to file his reply brief in support of the Plaintiff's Amended Motion for Temporary Restraining Order and

[1] The plaintiff has alleged in this federal suit that the defendants violated the "Wisconsin Election Code." Dkt. No. 9 at 11. This court has made no determination regarding whether it has jurisdiction to resolve that claim.

Preliminary Injunction to be Considered in an Expedited Manner (Dkt. No. 10) by 5:00 p.m. on **Tuesday, December 8, 2020.**

The court directs the parties' attention to Civil L.R. 7(f), which provides that memoranda in opposition to motions are limited to **thirty pages** and reply briefs in support of motions are limited to **fifteen pages**.

Finally, an administrative note: On December 2, 2020 a document was docketed as a notice of appearance for lead counsel Sidney Powell. Dkt. No. 8. The document is blank (except for the designation of the court); the court does not have a completed notice of appearance on file for Attorney Powell.

The court **GRANTS** the plaintiff's amended motion to the extent that it is a Civil L.R. 7(h) Expedited Non-Dispositive Motion for an Expedited Briefing Schedule. Dkt. No. 10.

The court **ORDERS** that the defendants' opposition brief to the Plaintiff's Amended Motion for Temporary Restraining Order and Preliminary Injunction to be Considered in an Expedited Manner (Dkt. No. 10) by must be filed by 5:00 p.m. on **Monday, December 7, 2020**.

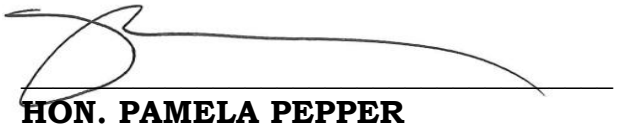
The court **ORDERS** that the plaintiff's reply brief in support of the Plaintiff's Amended Motion for Temporary Restraining Order and Preliminary Injunction to be Considered in an Expedited Manner (Dkt. No. 10) must be filed by 5:00 p.m. on **Tuesday, December 8, 2020**.

The court **DEFERS RULING** on the amended motion to the extent that it

asks the court to issue a temporary restraining order or a preliminary injunction.

Dated in Milwaukee, Wisconsin this 4th day of December, 2020.

BY THE COURT:



HON. PAMELA PEPPER
Chief United States District Judge

UNITED STATES DISTRICT COURT

v.

Wisconsin Elections Commission, *et al.*,[1]

Defendants

INTERVENOR-DEFENDANT CIVIL L. R. 7(H) EXPEDITED NONDISPOSITIVE MOTION TO INTERVENE

I am seeking to participate as an intervening defendant in the above-captioned lawsuit pursuant to Federal Rule of Civil Procedure 24. I have a right under Rule 24(a)(2) to intervene as the outcome of this case directly impacts my constitutional right to vote. In the alternative, I seek permissive intervention pursuant to Rule 24(b). I am requesting this court rule on this motion in an expedited manner pursuant to Local Civil Rule 7(h).

I previously filed a Motion to Intervene[2] along with an accompanying brief and proposed answer the original complaint. At the time of filing that motion, no motions seeking an expedited ruling had been filed[3]. Additionally, the court indicated it was going to await the defendants' opposition brief[4] which the plaintiffs had 21 days to file. As a result, it was not necessary at that time for my motion to intervene be heard on an expedited basis pursuant to Civil L. R. 7(h).

[1] I note that the William Feehan filed an amended complaint removing Derrick Van Orden from the case and used a caption with only William Feehan. However, I was unable to locate a motion or order amending the case caption nor any local rules that automatically amend the caption upon filing of an amended complaint. Therefore, I have kept the case caption as it was originally filed. See Dkt. No. 9 for the Amended Complaint

[2] See Dkt. No. 14 and Dkt. No. 15.

[3] See Dkt. No. 6 "Order Regarding Amended Motion for Injunctive Relief (Dkt. No. 6).

[4] See Dkt. No. 6 "Order Regarding Amended Motion for Injunctive Relief (Dkt. No. 6).

However, plaintiff has since filed an expedited non-dispositive motion for a temporary restraining order and preliminary injunction[5]. Further that motion contains a proposed briefing schedule that would require responses and replies be filed by Dec. 4th and Dec. 5th respectively. At the time of drafting this motion, it is Dec 3rd and by the time this motion reaches the court it will already be Dec 4th. As a result, it has now become critically important that the court issue a ruling on this motion to intervene in an expedited manner pursuant to Local Civil Rule 7(h).

I seek to protect my legally protected constitutional rights to have my vote counted without delaying this case. If this motion to intervene is granted, I would ask to have until Dec. 5th at 8pm to file an Intervenor-Defendants opposition brief. Due to the court being closed at that time and needing to file outside of the ECF[6] I request permission to submit that brief via e-mail.

I sent copies of my motion to intervene, brief in support of motion to intervene and proposed answer to the plaintiffs' attorney at Sidney@federalappeals.com and miked@michaelddeanllc.com on December 2nd at 6:55pm. On December 3rd I sent paper copies of these documents to the defendants and plaintiff's attorneys via US Mail. When the attorneys for the defendants entered their appearance in this case, I sent electronic copies to Attorney Snyder at rsnyder@staffordlaw.com, Attorney Mandell at JMandel@staffordlaw.com and Attorney Murphy at Murphysm@doj.state.wi.us at 1:11pm on December 3rd.

In an e-mail sent to Attorney Murphy, Mandell, Snyder, Dean and Powell at 1:11pm on December 3rd, I asked the attorneys if they would be opposing my motion to intervene. I further asked if they would be opposed to me joining the briefing schedule as I outlined above if this

[5] While the "PLAINTIFF'S AMENDED MOTION FOR TEMPORARY RESTRAINING ORDER AND PRELIMINARY INJUNCTION TO BE CONSIDERED IN AN EXPEDITED MANNER" does not explicitly reference L. R. 7(h) and does not completely conform to the requirements of L. R. 7(h)(2), it appears to be the intent of the plaintiff that this motion be treated as such.

[6] I am unable to use the ECF system as I am not admitted to practice before the Eastern District of Wisconsin Federal Court.

motion is granted. As of 4:45pm I had received no e-mail response. I then called Attorneys Mandell, Murphy, Dean and Powell at the phone numbers listed in the filings. Attorney Mandell indicated that Governor Tony Evers will not be objecting to my intervention. I left voicemail messages for the other three attorneys but as of 5:58pm I have received no further response. Due to the need to overnight this document, I am unable to wait longer for a response from those attorneys.

Therefore, I request that the Court grant me permission to intervene in the above-captioned matter and enter such an order by 5pm on Friday December 4th. Further, if the court follows the plaintiffs proposed briefing schedule, I request the court to permit me to file, via e-mail, an Intervenor-Defendants opposition brief by 8pm on Saturday December 5th.

Dated: December 3rd, 2020

Case No.: 20CV1771

DEFENDANT GOVERNOR EVERS'S MOTION REQUESTING LEAVE TO FILE AN OVERSIZED MEMORANDUM

Earlier this afternoon, the Court issued an order granting in part Plaintiff's "Amended Motion for Temporary Restraining Order and Preliminary Injunction To Be Considered in an Expedited Manner." The Court's order establishes a briefing schedule on the merits of Plaintiff's request for injunctive relief, and it specifically reminds the parties of Civil Local Rule 7(f), which sets a default page limit of 30 pages for briefs supporting or opposing most motions: "No memorandum exceeding the page limitations may be filed *unless the Court has previously granted leave to file an oversized memorandum*." (emphasis added).

Defendant Governor Evers intends both to oppose Plaintiff's motion and to argue in support of a motion to dismiss Plaintiff's complaint. Governor Evers plans to address both motions in one brief. That approach will be more efficient for all parties and the Court. To facilitate this approach and to increase efficiency, Governor Evers respectfully requests, pursuant to Civil Local Rule 7(f), that the Court grant leave to file an oversized consolidated memorandum, not to exceed forty-five pages. Counsel will endeavor not to use the full amount of space unnecessarily.

Respectfully submitted this 4th day of December 2020.

UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff,

Case No. 20-cv-1771-pp

v.

WISCONSIN ELECTIONS COMMISSION, *et al.*,

Defendants.

ORDER ALLOWING JAMES GESBECK TO FILE AN *AMICUS* BRIEF

The plaintiff's amended complaint alleges that the 2020 election process "is so riddled with fraud, illegality, and statistical impossibility that this Court, and Wisconsin's voters, courts, and legislators, cannot rely on, or certify, any numbers resulting from this election." Dkt. No. 9 at ¶5. It states that the court "must set aside the results of the 2020 General Election and grant the declaratory and injunctive relief requested herein." Id.

The amended complaint first asserts that the election software and hardware used by defendant the Wisconsin Elections Commission were subject to hacking and manipulation and that "Wisconsin officials" disregarded widely reported concerns to this effect in utilizing the hardware and software. Id. at ¶¶6-13, 52-99. Next, it asserts that the Wisconsin Elections Commission issued improper guidance to clerks and election officials in violation of Wisconsin law. Id. at ¶¶14, 37-45. Third, it alleges that mail-in ballots either were lots or were fraudulently recorded for voters who did not request them. Id.

at ¶¶46-50. Fourth, it asserts that voters who were ineligible to vote because they were registered in other states nonetheless voted in Wisconsin. Id. at ¶51.

The plaintiff requests the following relief:

> 1. An order directing Governor Evers and the Wisconsin Elections Commission to de-certify the election results;
>
> 2. An order enjoining Governor Evers from transmitting the currently certified election results [to] the Electoral College;
>
> 3. An order requiring Governor Evers to transmit certified election results that state that President Donald Trump is the winner of the election;
>
> 4. An immediate temporary restraining order to seize and impound all servers, software, voting machines, tabulators, printers, portable media, logs, ballot applications, ballot return envelopes, ballot images, paper ballots, and all "election materials" referenced in Wisconsin Statutes § 9.01(1)(b)11. related to the November 3, 2020 Wisconsin election for forensic audit and inspection by the Plaintiff;
>
> 5. An order that no votes received or tabulated by machines that were not certified as required by federal and state law be counted;
>
> 6. A declaratory judgment declaring that Wisconsin's failed system of signature verification violates the Electors and Elections Clause by working a de facto abolition of the signature verification requirement;
>
> 7. A declaratory judgment declaring that currently certified election results violate the Due Process Clause, U.S. CONST. Amend. XIV;
>
> 8. A declaratory judgment declaring that mail-in and absentee ballot fraud must be remedied with a Full Manual Recount or statistically valid sampling that properly verifies the signatures on absentee ballot envelopes and that invalidates the certified results if the recount or sampling analysis shows a sufficient number of ineligible absentee ballots were counted;
>
> 9. A declaratory judgment declaring absentee ballot fraud occurred in violation of Constitutional rights, Election laws and under state law;

> 10. A permanent injunction prohibiting the Governor and Secretary of State from transmitting the currently certified results to the Electoral College based on the overwhelming evidence of election tampering;
>
> 11. Immediate production of 48 hours of security camera recordings of all voting central count facilities and processes in Milwaukee and Dane Counties for November 3, 2020 and November 4, 2020.

Id. at ¶142.

Two days after the complaint was filed, the court received a motion to intervene as a defendant from James Gesbeck. Dkt. No. 14. Mr. Gesbeck stated that he is a Wisconsin citizen who voted in the 2020 general election in Wisconsin. Dkt. No. 15 at 1. He indicated that he voted in Dane County via absentee ballot. Id. at 2. He asserted that if the court were to grant the plaintiff's request to decertify the election results and order defendant Evers to transmit certified election results stating that President Donald Trump is the winner of the election, it would "disregard the results of the 2020 General Election in Wisconsin in which [his] vote was cast." Id. at 3. He stated that a "court order directing the outcome of the election would disenfranchise [him] by not counting [his] vote, nor the votes of millions of people." Id. Mr. Gesbeck also said that his interest was in defending his right to vote, and that none of the defendants are tasked with defending that right and thus cannot defend his interests. Id. Mr. Gesbeck argued that he is entitled to intervention as of right but asserts in the alternative that he meets the standard for permissive intervention. Id. at 4.

Earlier on December 3, the court had received from the plaintiff an amended motion for injunctive relief and request for an expedited briefing schedule. Dkt. No. 10. It appears Mr. Gesbeck—who, while he is an attorney, is not admitted to practice before this court and is not an electronic filer (dkt. no. 10 at 1 and n.3)—was not aware of that motion at the time he filed his motion to intervene. When he became aware of that motion, and realized that the court might take briefing and reach the merits of the plaintiff's amended motion for injunctive relief before it ruled on his motion to intervene, Mr. Gesbeck filed a Civil Local Rule 7(h) (E.D. Wis.) expedited, non-dispositive motion to intervene. Dkt. No. 33. He asked the court to rule on his motion by 5:00 p.m. on Friday, December 4 so that he could file a brief in opposition to the plaintiff's amended motion for injunctive relief. Id. at 3.

The court received Mr. Gesbeck's Civil L.R. 7(h) motion at 4:12 p.m. on Friday, December 4. The court could not rule on his motion by 5:00 p.m. on December 4. The plaintiff has not responded (and Civil L.R. 7(h) does anticipate a non-moving party having an opportunity to respond). While Mr. Gesbeck asserts that he is entitled to intervene under Fed. R. Civ. P. 24(a) (or, in the alternative, that he qualifies for permissive intervention under Rule 24(b)), the court must consider issues such as whether the current defendants adequately represent his interests and whether he has standing. See, *e.g.*, Flying J., Inc. v. Van Hollen, 578 F.3d 569, 571 (7th Cir. 2009) ("[T]he interest required by Article III is not enough by itself to allow a person to intervene in a federal suit and thus become a party to it."); Planned Parenthood of Wis., Inc. v. Kaul, 942

F.3d 793, 803 n.5 (7th Cir. 2019) (noting that the Seventh Circuit has not yet addressed whether permissive intervention requires standing if the existing parties have a live case or controversy).

While the Federal Rules of Civil Procedure do not provide for the filing of *amicus curiae* briefs in the district court (as opposed to Fed. R. App. P. 29, which governs such filings in federal appellate courts), some district courts have held that they have inherent authority to appoint an amicus curiae—a "friend of the court." See, *e.g.*, Recht v. Justice, No. 5:20-CV-90, 2020 WL 6109426, at *1 (N.D. W. Va. June 9, 2020); Bounty Minerals, LLC v. Chesapeake Exploration, LLC, No. 5:17cv1695, 2019 WL 7048981, at *10 (N.D. Ohio Dec. 23, 2019); Jin v. Ministry of State Security, 557 F. Supp. 2d 131, 136 (D. D. C. 2008); NGV Gaming, Ltd. v. Upstream Point Molate, LLC, 355 F. Supp. 2d 1061, 1067 (N.D. Cal. 20005).

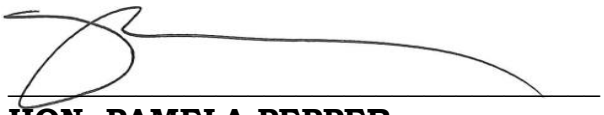
"The term 'amicus curiae' means friend of the court, not friend of a party." Ryan v. Commodity Futures Trading Com'n, 125 F.3d 1062, 1063 (7th Cir. 1997) (citing United States v. Michigan, 940 F.2d 143, 164-65 (6th Cir. 1991)). "An amicus brief should normally be allowed when a party is not represented competently or is not represented at all, when the amicus has an interest in some other case that maybe affected by the decision in the present case . . . or when the amicus has unique information or perspective that can help the court beyond the help that the lawyers for the parties are able to provide." Id. (Citations omitted.)

Because the court cannot rule on Mr. Gesbeck's motion to intervene prior to the deadline for the defendants to oppose the plaintiff's amended motion for injunctive relief and because Mr. Gesbeck indicates that his interest is not represented in the litigation, the court will allow him to file an *amicus curiae* brief by 5:00 p.m. on Monday, December 7, 2020. The brief may not exceed thirty pages.

The court **ORDERS** that Mr. James Gesbeck may file an *amicus curiae* brief by 5:00 p.m. on Monday, December 7, 2020.

Dated in Milwaukee, Wisconsin this 4th day of December, 2020.

BY THE COURT:



HON. PAMELA PEPPER
Chief United States District Judge

IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff,

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMANN, JULIE M. GLANCEY, DEAN HUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

No. 2:20-cv-1771

EXPEDITED NONDISPOSITIVE MOTION TO INTERVENE OF PROPOSED INTERVENOR-DEFENDANT DEMOCRATIC SERVICES CORPORATION/DEMOCRATIC NATIONAL COMMITTEE (THE "DNC") PURSUANT TO CIVIL L. R. 7(h)

Proposed Intervenor-Defendant Democratic Services Corporation/Democratic National Committee ("DNC") respectfully moves for expedited consideration of its motion for leave to intervene in this action to defend its interests against the claims asserted by Plaintiff. For the reasons discussed in the Proposed Intervenor-Defendant DNC's Brief in Support of Motion to Intervene ("DNC Intervention Brief) filed on December 4, 2020 (Dkt. No. 23), the DNC is entitled to intervene in this case as a matter of right under Federal Rule of Civil Procedure 24(a)(2). In the alternative, the DNC requests permissive intervention pursuant to Rule 24(b).

At the time the DNC filed its Motion to Intervene,[1] the Court had indicated it would await the Defendants' opposition brief, which Plaintiff had 21 days to file. Dkt. No. 7. Thereafter, this Court set an expedited briefing schedule requiring responses and replies to be filed by December 7 and 8, 2020, respectively. Today, December 5, 2020, the Court also set a deadline of December 28, 2020, for Plaintiff's response to the DNC's Motion to Intervene.

In order to protect Proposed Intervenor-Defendant DNC's rights and critical interests as set forth in the DNC Intervention Brief, the DNC respectfully requests that the Court consider the DNC's motion expeditiously and grant it permission to intervene in this case as soon as reasonably possible. The DNC is prepared to submit its response as an Intervenor-Defendant in accordance with this Court's schedule (i.e., by 5:00 p.m. on December 7, 2020).

Counsel for the DNC has asked counsel for both the Plaintiff and the Defendants if they oppose the DNC's motion to intervene. Plaintiff's counsel states that that it opposes the DNC's motion. None of the Defendants oppose the DNC's motion.

WHEREFORE, the DNC requests that the court grant it leave to intervene in the above-captioned matter so that it may file its response in accordance with the Court's expedited schedule in this matter.

DATED: December 5, 2020

[1] Dkt. No. 22. In accordance with Rule 24(c), a proposed answer to Plaintiff's complaint was attached as Exhibit 1 to the DNC's Motion to Intervene. *Id.*, Attachment 1.

ORDER GRANTING REQUEST TO EXPEDITE RULING (DKT. NO. 40), DENYING MOTION TO INTERVENE OF PROPOSED INTERVENOR-DEFENDANT DEMOCRATIC SERVICES CORPORATION/DEMOCRATIC NATIONAL COMMITTEE (THE "DNC") (DKT. NO. 22) AND ALLOWING DNC TO FILE *AMICUS* BRIEF

The plaintiff's amended complaint alleges that the 2020 election process "is so riddled with fraud, illegality, and statistical impossibility that this Court, and Wisconsin's voters, courts, and legislators, cannot rely on, or certify, any numbers resulting from this election." Dkt. No. 9 at ¶5. It states that the court "must set aside the results of the 2020 General Election and grant the declaratory and injunctive relief requested herein." Id.

The amended complaint first asserts that the election software and hardware used by defendant the Wisconsin Elections Commission were subject to hacking and manipulation and that "Wisconsin officials" disregarded widely reported concerns to this effect in utilizing the hardware and software. Id. at ¶¶6-13, 52-99. Next, it asserts that the Wisconsin Elections Commission issued improper guidance to clerks and election officials in violation of

Wisconsin law. Id. at ¶¶14, 37-45. Third, it alleges that mail-in ballots either were lost or were fraudulently recorded for voters who did not request them. Id. at ¶¶46-50. Fourth, it asserts that voters who were ineligible to vote because they were registered in other states nonetheless voted in Wisconsin. Id. at ¶51.

The plaintiff requests the following relief:

> 1. An order directing Governor Evers and the Wisconsin Elections Commission to de-certify the election results;
>
> 2. An order enjoining Governor Evers from transmitting the currently certified election results [to] the Electoral College;
>
> 3. An order requiring Governor Evers to transmit certified election results that state that President Donald Trump is the winner of the election;
>
> 4. An immediate temporary restraining order to seize and impound all servers, software, voting machines, tabulators, printers, portable media, logs, ballot applications, ballot return envelopes, ballot images, paper ballots, and all "election materials" referenced in Wisconsin Statutes § 9.01(1)(b)11. related to the November 3, 2020 Wisconsin election for forensic audit and inspection by the Plaintiff;
>
> 5. An order that no votes received or tabulated by machines that were not certified as required by federal and state law be counted;
>
> 6. A declaratory judgment declaring that Wisconsin's failed system of signature verification violates the Electors and Elections Clause by working a de facto abolition of the signature verification requirement;
>
> 7. A declaratory judgment declaring that currently certified election results violate the Due Process Clause, U.S. CONST. Amend. XIV;
>
> 8. A declaratory judgment declaring that mail-in and absentee ballot fraud must be remedied with a Full Manual Recount or statistically valid sampling that properly verifies the signatures on absentee ballot envelopes and that invalidates the certified results if the recount or sampling analysis shows a sufficient number of ineligible absentee ballots were counted;

> 9. A declaratory judgment declaring absentee ballot fraud occurred in violation of Constitutional rights, Election laws and under state law;
>
> 10. A permanent injunction prohibiting the Governor and Secretary of State from transmitting the currently certified results to the Electoral College based on the overwhelming evidence of election tampering;
>
> 11. Immediate production of 48 hours of security camera recordings of all voting central count facilities and processes in Milwaukee and Dane Counties for November 3, 2020 and November 4, 2020.

Id. at ¶142.

The day after the plaintiff filed the amended complaint, the movant—Democratic Services Corporation/Democratic National Committee (the "DNC")—filed a motion to intervene. Dkt. No. 2. The movant describes itself as "a diverse group of Democrats, including elected officials, candidates, constituents, and voters." Dkt. No. 23 at 2. It asserts that the amended complaint "seek[s] to undo Wisconsin's lawful certification of the election result" and maintains that "[t]he extraordinary relief Plaintiffs[1] request would deprive the DNC's members and constituents of their rights to have their votes counted, undermine the electoral prospects of the DNC's candidates, and divert the DNC's resources." Id.

The movant first argues that it is entitled to intervene as of right under Fed. R. Civ. P. 24(a). Id. It argues that its motion is timely filed, id. at 2-3, that it has significant interests at stake in the litigation, id. at 3-4, that denial of the

[1] The original complaint was filed by two plaintiffs—William Feehan and Derrick Van Orden. Dkt. No. 1. William Feehan is the only plaintiff named in the amended complaint; Van Orden no longer is a defendant. Dkt. No. 9.

motion would impair its ability to protect its interests, id. at 5, and that its interests are not adequately represented by the defendants, id. at 5-7. The movant next argues that if the court does not agree that it is entitled to intervene as of right, the court should exercise its discretion to permit it to intervene under Fed. R. Civ. P. 24(b). Id. at 7-8.

After the court extended the Civil Local Rule 7(b) (E.D. Wis.) deadline for the plaintiff to respond (because the twenty-one-day deadline would have fallen on December 25, 2020), dkt. no. 38, the movant filed a Civil L.R. 7(h) expedited, nondispositive motion asking the court to rule on the motion to intervene "as soon as reasonably possible," stating that it was prepared to file a response by the deadline the court has set for the defendants to respond (5:00 p.m. on Monday, December 7, 2020). Dkt. No. 40.

The court grants the request for an expedited ruling, denies the motion to intervene and authorizes the movant to file an *amicus* brief.

A. Intervention As of Right

Fed. R. Civ. P. 24(a) provides that "[o]n timely motion, the court *must* permit anyone to intervene" if the party seeking to intervene "claims an interest relating to the . . . transaction that is the subject of the action, and is so situated that disposing of the action may as a practical matter impair or impede the movant's ability to protect its interest, unless existing parties adequately represent that interest." (Emphasis added.) The Seventh Circuit has described the rule as "straightforward:"

> [T]he court *must* permit intervention if (1) the motion is timely; (2) the moving party has an interest relating to the property or

> transaction at issue in the litigation; and (3) that interest may, as a practical matter, be impaired or impeded by disposition of the case. A proposed intervenor who satisfies these three elements is *entitled* to intervene *unless* existing parties adequately represent his interests.

Driftless Area Land Conservancy v. Huebsch, 969 F.3d 742, 746 (7th Cir. 2019) (emphasis in the original).

1. *Timeliness of the Motion*

"The test for timeliness is essentially one of reasonableness: 'potential intervenors need to be reasonably diligent in learning of a suit that might affect tehri rights, and upon so learning they need to act promptly.'" Reich v. ABC/York-Estes Corp., 64 F.3d 316, 321 (7th Cir. 1995 (quoting Nissei Sangyo America, Ltd. v. United States, 31 F.3d 435, 438 (7th Cir. 1994)). In determining whether the potential intervenor was reasonably diligent, courts "also consider the prejudice to the original party if intervention is permitted and the prejudice to the intervenor if his motion is denied." Id. The Seventh Circuit has expressed these concepts in the form of a four-factor test:

> (1) the length of time the intervenor knew or should have known of his interest in the case; (2) the prejudice caused to the original parties by the delay; (3) the prejudice to the intervenor if the motion is denied; (4) any other unusual circumstances.

State v. City of Chi., 912 F.3d 979, 984 (7th Cir. 2019) (quoting Grochinski v. Mayer Brown Rowe & Maw, LLP, 719 F.3d 785, 797-90 (7th Cir. 2013)).

The movant filed its motion to intervene three days after the original complaint was filed and a day after the amended complaint. There would be no prejudice to the original parties in allowing the movant to intervene, particularly as it says that it is prepared to oppose the plaintiff's motion for

injunctive relief by the December 7, 2020 deadline the court has set. The movant did not address the third and fourth factors—the prejudice to the movant if the court does not allow it to intervene and any other unusual circumstances. Because the movant filed its motion only a day after the plaintiff filed the original complaint, however, the court concludes that the motion is timely.

2. *The Moving Party's Interest*

The movant next must demonstrate that it has an interest relating to the property or transaction at issue in the litigation. The "transactions" at issue in this litigation are the decisions of defendants the Wisconsin Elections Commission and its members to sign the canvass statement for the 2020 general election and the recount in Dane and Milwaukee Counties and the action of defendant Governor Tony Evers in signing the Certificate of Ascertainment certifying the results of the 2020 general election.

The question of whether the movant, a self-described "diverse group of Democrats, including elected officials, candidates, constituents, and voters," has an "interest" in those transactions is not as straightforward as one might imagine.

> Rule 24(a)(2) requires that the applicant claim "an interest relating to the property or transaction that is the subject of the action." "Interest" is not defined, but the case law makes clear that more than the minimum Article III interest is required. Cases say for example that a mere "economic interest" is not enough. E.g., *In re Lease Oil Antitrust Litigation*, 570 F.3d 244, 250-52 (5th Cir. 2009); *Mountaintop Condominium Ass'n v. Dave Stabbert Master Builder, Inc.*, 72 F.3d 361, 366 (3d Cir. 1995); cf. *Reich v. ABC/York-Estes Corp.*, 64 F.3d 316, 322-23 (7th Cir. 1995). While that is a confusing

> formulation—most civil litigation is based on nothing more than an "economic interest"—all that the cases mean is that the fact that you might anticipate a benefit from a judgment in favor of one of the parties to the lawsuit—maybe you're a creditor of one of them—does not entitle you to intervene in their suit.

Flying J, Inc. v. Van Hollen, 578 F.3d 569, 571 (7th Cir. 2009).

The movant contends that it has an interest in preventing disruption of the certification of Wisconsin's November 3, 2020 Presidential election results and preserving the "entitlement of the Democratic Party's candidates for President and Vice-President to Wisconsin's ten electoral votes." Dkt. No. 23 at 3-4. It also asserts an interest in avoiding disenfranchisement of its constituents and in avoiding having to "divert resources to safeguard the timely certification of statewide results." Id. at 4. The movant could anticipate benefits from a judgment in favor of the defendants; because the defendants certified the movant's candidates for President and Vice-President as the winners of Wisconsin's 2020 general election, a judgment in the defendants' favor would leave intact that certification.

Related to—possibly entangled with—the concept of "interest" is the question of standing. The Seventh Circuit has held that "[n]o one can maintain an action in a federal court . . . unless he has standing to sue, in the sense required by Article III of the Constitution—that is, unless he can show injury . . . and that he would benefit from a decision in his favor." Flying J, Inc., 578 F.3d at 571. "Standing to sue" implies that it is only the plaintiff who must have standing. In most cases, the question of whether a defendant has standing does not arise because the plaintiff has sought relief against the

plaintiff. But a party who seeks to intervene as a *defendant* seeks to intervene in a lawsuit brought by a plaintiff who has not sought relief against it. See Matthew I. Hall, *Standing of Intervenor-Defendants in Public Law Litigation*, 80 Fordham L. Rev. 1539, 1552 (2012). Whether such a defendant—particularly when the defendant represents a broad public interest (as, arguably, the movant does)—must have Article III standing is unclear. See, *e.g.*, Diamond v. Charles, 476 U.S. 54, 68 (1986) (concluding that it need not decide whether a party seeking to intervene due to public concerns must have Article III standing); Gregory R. Manring, *It's Time for an Intervention: Resolving the Conflict Between Rule 24(a)(2) and Article III Standing*, 85 Fordham L. Rev. 2525 (2017).

The movant points to cases in which courts have found that political parties have standing to sue. It cites Tex. Democratic Party v. Benkiser, 459 F.3d 582 (5th Cir. 2006), in which the Fifth Circuit concluded that the Texas Democratic Party had standing to contest the party chair's declaration that Representative Tom DeLay was ineligible for election. It cites Owen v. Mulligan, 640 F.2d 1130, 1132 (9th Cir. 1981), in which the Ninth Circuit characterized the defendant's argument that "the only threatened injury to the plaintiffs is the potential loss of an election" as having been "uniformly rejected." It points to a recent case in which a district court found that partisan political groups were entitled to intervene as of right in litigation relating to the 2020 election. Issa v. Newsome, No. 2:20-cv-01044-MCD-CKD, 2020 WL 3074351 (E.D. Cal. June 10, 2020) (allowing the Democratic Congressional Campaign Committee

and the Democratic Party of California to intervene as defendants as a matter of right under Rule 24(a)(2) in a case seeking to enjoin enforcement of the governor's executive order requiring California counties to implement all-mail ballot elections for the November 3, 2020 general election.

The question of whether a defendant-intervenor must have Article III standing, and what that standing might look like when the potential defendant-intervenor represents a broad public interest, is fraught. Without deciding today whether a defendant-intervenor must have Article III standing or what would constitute such standing, the court assumes that the movant has an interest in the transactions that give rise to the litigation and will move to the next two factors.

3. *Impairment of the Movant's Interest*

"The existence of 'impairment' depends on whether the decision of a legal question involved in the action would as a practical matter foreclose rights of the proposed intervenors in a subsequent proceeding." Meridian Homes Corp. v. Nicholas W. Prassas & Co., 683 F.2d 201, 204 (7th Cir. 1982). (Citation omitted). The "foreclosure" of the proposed intervenor's rights "is measured by the general standards of stare decisis." Id. (Citations omitted.) In other words, whether or not the defendants succeed in this suit, is the movant free to initiate its own suit? See, Shea v. Angulo, 19 F.3d 343, 347 (7th Cir. 1994).

Because the movant's interests are prevention of the disruption of the certification of Wisconsin's November 3, 2020 Presidential election results and

preservation of the "entitlement of the Democratic Party's candidates for President and Vice-President to Wisconsin's ten electoral votes," dkt. no. 23 at 3-4, as well as avoiding disenfranchisement of its constituents and in avoiding having to "divert resources to safeguard the timely certification of statewide results," Id. at 4, a decision granting the relief the plaintiff requests—decertifying the results of Wisconsin's 2020 general election and ordering the defendants to certify a different result—likely would foreclose the movant's rights in a subsequent suit. The movant cannot bring suit as a plaintiff because it has no complaint with the *status quo*. Because the electoral college will meet and vote in eight days, the movant likely would not have time to mount its own suit in the event this court rules in favor of the plaintiff.

The movant has demonstrated that as a practical matter, its interests may be impaired or impeded by disposition of case, depending on that disposition.

4. *Adequacy of Representation*

The movant asserts that its interests are not adequately represented by the existing parties. Dkt. No. 23 at 5. It says that while the defendants "have an interest in defending the actions of state officials," it is interested in "ensuring that the valid ballot of every Democratic voter in Wisconsin is counted and safeguarding the election of Democratic candidates." Id. at 6. It says that it has "specific interests and concerns—including the Democratic Party's overall electoral prospects and use of their limited resources—that none of the current Defendants share." Id.

The Seventh Circuit has spoken extensively on this factor of the Rule 24(a) test in the past year. Most recently, in Driftless, the court explained that

> "[t]he most important factor in determining adequacy of representation is how the interest of the absentee compares with the interests of the present parties." 7C CHARLES ALAN WRIGHT & ARTHUR MILLER & MARY KAY KANE, FEDERAL PRACTICE AND PROCEDURE § 1909 (3d ed. 2007). Our recent decision in *Planned Parenthood of Wisconsin, Inc. v. Kaul* describes our circuit's three-tiered methodology for evaluating adequacy of representation under Rule 24(a)(2). 942 F.3d 793, 799 (7th Cir. 2019). "The default rule," we explained, "is a liberal one." *Id.* It derives from the Supreme Court's decision in *Trbovich v. United Mine Workers of America*, which explained that "the requirement of the Rule is satisfied if the applicant shows that representation of his interest 'may be' inadequate; and the burden of making that showing should be treated as minimal." 404 U.S. 528, 538 n.10 . . . (1972).
>
> However, if the interest of the absentee is identical to that of an existing party, or if a governmental party is charged by law with representing the absentee's interest, then the standard for measuring adequacy of representation changes. In both situations—where the absentee and an existing party have identical interests, or the existing party is a governmental agency or official with a legal duty to represent the absentee's interest—a rebuttable presumption of adequate representation arises, and the prospective intervenor must carry a heightened burden to establish inadequacy of representation. The degree of this heightened burden varies.

Driftless Area Land Conservancy, 969 F.3d at 747.

So—if the movant's interest is not identical to that of an existing party or if there is no governmental party charged by law with representing the movant's interest, the movant has only the minimal burden of showing that the party's representation "may be" inadequate. But if the movant's interest is identical to that of an existing party, "there is a rebuttable presumption of adequate representation that requires a showing of 'some conflict' to warrant intervention." Planned Parenthood, 942 F.3d at 799 (quoting Wis. Ed. Ass'n

Council v. Walker ("WEAC"), 705 F.3d 640, 659 (7th Cir. 2013)). And if one of the existing parties is a governmental body charged by law with protecting the interests of the movant, the presumption is even stronger and the standard for rebutting the presumption higher. Id.

Defendant the Wisconsin Elections Commission is a governmental body; its members and defendant Governor Tony Evers are representatives of government bodies. The movant asserts, however, that none of them are charged by law with protecting its interests. Dkt. No. 23 at 6 n.2. The Wisconsin Elections Commission "administers and enforces Wisconsin elections law." https://elections.wi.gov/about. It appears that neither the WEC nor its members are charged with protecting the interests of a party or candidate. But its mission would appear to include ensuring that the valid ballot of every voter—Democratic, Republican or other—is counted. In the narrower context of the lawsuit, the court presumes the WEC's interest and that of its members is in defending its actions in administering and enforcing Wisconsin's election laws, particularly in signing the canvass statement for the 2020 Presidential general election results after the recount in Milwaukee and Dane Counties. And the interest of defendant Governor Evers presumably will be to defend his signing of the Certificate of Ascertainment certifying the results of that election.

The court agrees that none of the defendants are "charged by law with protecting the interests of the proposed intervenors," Planned Parenthood, 942 F.3d at 799, to the extent that the movant's interests go beyond its interest in

the proper administration and enforcement of state and federal election laws and procedures. This means the movant need not rebut the most heightened presumption of adequacy.

But the movant and the defendants have "the same goal." WEAC, 705 F.3d at 659 (citing Shea, 19 F.3d at 347). The movant and the defendants both seek to defend the results of the Wisconsin 2020 Presidential general election. Both oppose the relief the plaintiff seeks—the decertification of the election and the certification of a different result. Both seek to defend the certification on the ground that the election was lawful and the results valid.

The fact that the movant and the defendants share the same goal may not necessarily give rise to the presumption of adequate representation. In her concurrence in Planned Parenthood, now-Chief Judge Sykes explained that in WEAC, the court had stated that an intervenor's interest must be "unique;" Judge Sykes sought to clarify:

> *WEAC* cited *Keith v. Daley*, 764 F.2d 1265, 1268 (7th Cir. 1985), as support for the uniqueness requirement. The relevant passage in *Keith*, however, doesn't use the term "unique." It says this: "The [intervenor's] interest must be based on a right that belongs to the proposed intervenor rather than to an existing party in the suit." *Id.* In other words, the intervenor's interest must be based on a right that is *direct* and *independent*. That much is clear from the immediately preceding sentence: "A proposed intervenor must demonstrate a direct, significant[,] and legally protectable interest in the property [or transaction] at issue in the lawsuit."
>
> "Unique" is a suitable word to describe the nature of the required interest, but as used in this context, "unique" means an interest that is *independent of* an existing party's, not *different from* an existing party's. If the intervenor has a significant independent interest but shares the same goal as an existing party (that is, if their interests align), then the standard for measuring the adequacy of existing

> representation changes, as WEAC later explains. 705 F.3d at 659 (explaining that a presumption of adequate representation arises when goals align). But sharing the same goal as an existing party doesn't defeat "uniqueness," properly understood.

Planned Parenthood, 942 F.3d at 806.

Given this clarification, Judge Sykes concluded that the Legislature had an independent right from the Attorney General because it had an independent, statutory right to intervene under Wis. Stat. §803.09(2m). Id.

The movant does not have a right, independent of the defendants, to defend the certification of the 2020 election results. It has different *reasons* for defending the certification. Its candidates were certified as the winners of the Presidential election; it and its constituents are pleased with the result. But the movant seeks to defend the certification because the movant believes it was lawful and because it asserts that decertification would result in valid votes being disregarded. The movant is more concerned about valid *Democratic* votes being disregarded. But its concern about *any* votes being disregarded aligns with the defendants' interests in defending the legality of the certification.

Because the movant has the same goal as the defendants and has identified no right independent of the defendants, the movant must rebut the presumption of adequate representation by "show[ing] that some conflict exists." WEAC, 705 F.3d at 659. The movant has not identified such a conflict.

5. *Conclusion*

The court concludes that because the movant has not rebutted the presumption that the defendants will adequately represent its interests and those of its constituents, it is not entitled to intervene as of right.

B. Permissive Intervention

In the alternative, the movant asks the court to exercise its discretion and allow it to intervene under Rule 24(b). Dkt. No. 23 at 7. It indicates that it will "inevitably raise common questions of law or fact," and that it would contribute to the complete development of the factual and legal issues before this Court . . . ." Id. at 7-8.

Rule 24(b)(1)(B) gives a court the discretion to allow a party to intervene if that party "has a claim or defense that shares with the main action a common question of law or fact." The Planned Parenthood decision sheds light on the distinction between Rules 24(a) and 24(b):

> Rule 24(b) is vague about the factors relevant to permissive intervention, but it is not just a repeat of Rule 24(a)(2). We have thus cautioned courts not to deny permissive intervention solely because a proposed intervenor failed to prove an element of intervention as of right. *See City of Chi. v. FEMA*, 660 F.3d 980, 987 (7th Cir. 2011); *Solid Waste Agency of N. Cook Cty. V. U.S. Army Corps of Eng'rs*, 101 F.3d 503, 509 (7th Cir. 1996). Still, we have never gone so far as confining the district court's discretion to only the two mandatory factors in Rule 24(b)(3) or to prohibit consideration of the elements of intervention as of right as discretionary factors. Even when a district court "did not explicitly break out its reasoning" on the two requests, we have affirmed so long as the "decision shows a thorough consideration of the interests of all the parties." *Ligas [ex rel. Foster v. Maram*, 478 F.3d 771] at 776 [7th Cir. 2007)].

Planned Parenthood, 942 F.3d at 804.

The court will not exercise its discretion to grant permissive intervention. First, as the court has noted, the issue of standing for defendant-intervenors is murky. While the Seventh Circuit has speculated that permissive intervention may not require standing "if the existing parties present a case or controversy," it has not decided the question. Id. at 803 n.5. Second, the court has noted

that the movant has not identified any conflict that would prevent the current defendants from adequately representing its interests. Third, the movant says that it would contribute to the adequate development of the record. That may be a contribution, but the movant may do it in another way—by advising the court as an *amicus*.

C. *Amicus Curiae*

While the Federal Rules of Civil Procedure do not provide for the filing of *amicus curiae* briefs in the district court (as opposed to Fed. R. App. P. 29, which governs such filings in federal appellate courts), some district courts have held that they have inherent authority to appoint an *amicus curiae*—a "friend of the court." See, *e.g.*, Recht v. Justice, No. 5:20-CV-90, 2020 WL 6109426, at *1 (N.D. W. Va. June 9, 2020); Bounty Minerals, LLC v. Chesapeake Exploration, LLC, No. 5:17cv1695, 2019 WL 7048981, at *10 (N.D. Ohio Dec. 23, 2019); Jin v. Ministry of State Security, 557 F. Supp. 2d 131, 136 (D. D.C. 2008); NGV Gaming, Ltd. v. Upstream Point Molate, LLC, 355 F. Supp. 2d 1061, 1067 (N.D. Cal. 20005).

In a federal circuit court, Fed. R. App. P. 29(1)(3) requires a party seeking to file an *amicus* brief to file a motion. The motion must state the movant's interest and why the *amicus* brief is desirable. The movant has not sought to file an *amicus* brief—it seeks to intervene as a party. The court has denied that relief but believes that the movant has demonstrated that it has an interest in the litigation.

The Seventh Circuit has cautioned that "[t]he term 'amicus curiae' means friend of the court, not friend of a party." Ryan v. Commodity Futures Trading Com'n, 125 F.3d 1062, 1063 (7th Cir. 1997) (citing United States v. Michigan, 940 F.2d 143, 164-65 (6th Cir. 1991)). "An amicus brief should normally be allowed when a party is not represented competently or is not represented at all, when the amicus has an interest in some other case that maybe affected by the decision in the present case . . . or when the amicus has unique information or perspective that can help the court beyond the help that the lawyers for the parties are able to provide." Id. (Citations omitted.) The movant argues that it has unique information and a unique perspective that the defendants do not have.

The court will, *sua sponte*, allow the movant to file an *amicus* brief relating to the plaintiff's request for injunctive relief, so that the movant may do what it has said it has the ability to do—help to fully develop the record. The movant must file its brief by the deadline the court has set for the defendants to file their briefs in opposition—5:00 p.m. on Monday, December 7, 2020. The movant also must abide by the page limitation in Civil L.R. 7(f)—no more than thirty pages.

D. Conclusion

The court **GRANTS** the movant's Expedited Nondispositive Motion to Intervene to the extent that it asks the court to expedite its ruling of the original motion to intervene. Dkt. No. 40.

The court **DENIES** the movant's Motion to Intervene of Proposed Intervenor-Defendant Democratic Services Corporation/Democratic National Committee. Dkt. No. 22.

The court **ORDERS** that the movant may file an *amicus curiae* brief by 5:00 p.m. on Monday, December 7, 2020.

Dated in Milwaukee, Wisconsin this 6th day of December, 2020.

BY THE COURT:

HON. PAMELA PEPPER
Chief United States District Judge

IN THE UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiffs. **CASE NO. 2:20-cv-1771**

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARLC L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN HUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

AMENDED PLAINTIFF'S MEMORANDUM IN SUPPORT OF MOTION FOR DECLARATORY, EMERGENCY, AND PERMANENT INJUNCTIVE RELIEF

To avoid possible confusion from removal of Mr. Van Orden is Plaintiff, this Amended Memorandum amends Plaintiff's original Memorandum in Support of Motion for Declaratory, Emergency, and Permanent Injunctive Relief, ECF Docket No. 3. It is identical to that original Memorandum except for amending references to Plaintiffs to refer to Mr. Meehan only and correcting several inadvertent references to the State of Georgia.

FACTS

The facts relevant to this motion are set forth in the Complaint and its accompanying exhibits, all of which are respectfully incorporated herein by reference. We present only a summary.

After a general election and recount, Joe Biden has been declared the winner of Wisconsin's General Election for President by a difference of 20,585 votes. But the vote count certified by

defendants on November 30, 2020 fails to recognize the votes are steeped in fraud. Tens of thousands of votes counted toward Mr. Biden's final tally were the product of fraudulent, illegal, ineligible and outright fictitious ballots. Plaintiff support this claim through the evidence laid out in the Complaint which includes the following conclusions:

The Complaint details a pervasive pattern of illegal conduct by Defendants where they systematically ignored, or acted in direct contravention of, the express requirements of Wisconsin Election Code provisions specifically intended to prevent voter fraud such as voter Photo ID, witness, signature, eligibility and address verification requirements, supported by witness affidavits and even written guidance from Defendant Wisconsin Elections Commission ("WEC") instructing election workers to violate the Wisconsin Election Code. *See* Compl., Section I.

In Section II and III of the Complaint, Plaintiff demonstrates through statistical analysis of voting results and technical analysis of voting machines and software that each of several distinct categories of voting fraud or batches of fraudulent ballots were larger than Biden's 20,585 margin.

The Affidavit of Russell James Ramsland, Jr. first examines the widely reported and "statistically impossible" Biden "spike" on November 4 where Biden, trailing Trump by a few percent, suddenly received 143,379 votes in a single five-minute interval, causing his relatively flat vote tally to make a vertical jump up and over Trump to take the lead in Wisconsin by about one percent. *See* Compl., Ex. 17 ¶13. Another red flag identified by Mr. Ramsland is the historically unprecedented turnout levels (not just for Wisconsin, but for anywhere except for countries like North Korea): 69 out of 72 Wisconsin counties had "voter turnout figures higher than 80%, a threshold generally considered to be the maximum expected," 59 were above 90%, and two were nearly 200% or more. *Id.* ¶15. Mr. Ramsland concludes "to a reasonable degree of

professional certainty" that the Biden spike included at least 119,430 illegal votes for Biden, while the total illegal votes from the fraudulent turnout figures was at least 384,085. *Id.* ¶14.

The Complaint provides testimony from several other experts who provided the estimates for illegal votes that should be discarded due to other categories of voting fraud:

- The report of William M. Briggs, Ph.D. finding that the average sum of two types of errors or fraud (either by Wisconsin election officials or third parties) – (1) absentee voters who were recorded as receiving ballots without requesting them and (2) absentee voters who returned ballots that were recorded as unreturned – was 29,594 votes (or nearly 31% of total). (*See id.*, Ex 2).

- Matt Braynard used the National Change of Address database to identify votes by persons that moved out of state or subsequently registered to vote in another state for the 2020 election, and found a total of 6,966 ineligible votes. (*See id.*, Ex 3).

- A separate analysis by Mr. Braynard of the likely number of votes that were improperly relying on the "indefinitely confined" exemption to voter ID to be 96,437 (*See id.*, Ex 3).

- Another expert witness, whose testimony has been redacted for his safety, estimates excess votes arising from the statistically significant outperformance of Dominion machines on behalf of Joe Biden to be 181,440. (*See id.*, Ex 3)

Thus each of these sources of fraudulent votes (with the exception of the still substantial number of illegal out-of-state voters) is larger than Biden's margin of victory, and if any of these categories of illegal voters were thrown out, it would change the result of the election, and give President Trump a second term.

Section III of the Complaint also provides testimony from experts regarding the security flaws in Wisconsin voting machines, in particular, Dominion Voting Systems ("Dominion") that allow Dominion, as well domestic and foreign actors, to alter, destroy, manipulate or exfiltrate ballot and other voting data, and potentially to do so without a trace due to Dominion's unprotected logs. For example, the Complaint includes an analysis of the Dominion software system by a former US Military Intelligence expert concludes that the system and software have been accessible and were

certainly compromised by rogue actors, such as Iran and China. (*See* Compl., Ex.105). By using servers and employees connected with rogue actors and hostile foreign influences combined with numerous easily discoverable leaked credentials, Dominion neglectfully allowed foreign adversaries to access data and intentionally provided access to their infrastructure in order to monitor and manipulate elections, including the most recent one in 2020. The substantial likelihood that hostile foreign governments, with or without active collusion or collaboration with the Defendants, is a separate and independent ground to grant the declaratory and injunctive relief requested in the Complaint and this Motion.

DISCUSSION

Plaintiff Has Standing

Plaintiff William Feehan**,** is a registered Wisconsin voter and a nominee of the Republican Party to be a Presidential Elector on behalf of the State of Wisconsin. "Electors have standing as candidates." *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020). As a candidate for elective office, Plaintiff has "a cognizable interest in ensuring that the final vote tally reflects the legally valid votes cast," as "[a]n inaccurate vote tally is a concrete and particularized injury to candidates such as the Electors." *Carson v. Simon*, 978 F.3d 1051, 1057 (8th Cir. 2020) (affirming that Presidential Electors have Article III and prudential standing to challenge actions of Secretary of State in implementing or modifying State election laws); *see also McPherson v. Blacker*, 146 U.S. 1, 27 (1892); *Bush v. Palm Beach Cty. Canvassing Bd.*, 531 U.S. 70, 76 (2000) (per curiam).

Plaintiff Is Entitled to Injunctive Relief.

"To obtain a preliminary injunction, a plaintiff must show three things: (1) without such relief, he will suffer irreparable harm before his claim is finally resolved; (2) he has no adequate remedy at law; and (3) he has some likelihood of success on the merits. *Harlan v. Scholz*, 866 F.3d 754,

758 (7th Cir. 2017) (*citing Girl Scouts of Manitou Council, Inc. v. Girl Scouts of U.S. of Am*., Inc., 549 F.3d 1079, 1086 (7th Cir. 2008)." "If the plaintiff can do that much, the court must then weigh the harm the plaintiff will suffer without an injunction against the harm the defendant will suffer with one." *Harlin*, 866 F.3d at 758 (*citing Ty, Inc. v. Jones Grp., Inc*., 237 F.3d 891, 895 (7th Cir. 2001). In addition, the court must ask whether the preliminary injunction is in the public interest. *Jones v. Markiewicz-Qualkinbush*, 842 F.3d 1053, 1058 (7th Cir. 2016).

All elements are met here. "When the state legislature vests the right to vote for President in its people, the right to vote as the legislature has prescribed is fundamental; and one source of its fundamental nature lies in the equal weight accorded to each vote and the equal dignity owed to each voter." *Bush v. Gore*, 531 U.S. 98, 104 (2000) (emphasis added). The evidence shows not only that Defendants failed to administer the November 3, 2020 election in compliance with the manner prescribed by the Wisconsin legislature, but that Defendants committed a scheme and artifice to fraudulently and illegally manipulate the vote count to make certain the election of Joe Biden as President of the United States. This conduct violated Plaintiffs' equal protection and due process rights as well their rights under Wisconsin law.

Plaintiff has a substantial likelihood of success.

The Plaintiff does not need to demonstrate a likelihood of absolute success on the merits. "Instead, [it] must only show that [its] chances to succeed on his claims are 'better than negligible.' " Whitaker v. Kenosha Unified Sch. Dist. No. 1 Bd. of Educ., 858 F.3d 1034, 1046 (7th Cir. 2017). (quoting Cooper v. Salazar, 196 F.3d 809, 813 (7th Cir. 1999)). "This is a low threshold," *id.*, that Plaintiff has easily passed.

Through detailed fact and expert testimony including documentary evidence contained in the Complaint and its exhibits, Plaintiff has made a compelling showing that Defendants' intentional

actions jeopardized the rights of Wisconsin citizens to select their leaders under the process set out by the Wisconsin Legislature through the commission of election frauds that violated state laws and the Equal Protection Clause in the United States Constitution. And pursuant to 42 U.S.C. § 1983, a plaintiff must demonstrate by a preponderance of the evidence that his constitutional rights to equal protection or fundamental right to vote were violated. *See, e.g., Radentz v. Marion Cty*., 640 F.3d 754, 756-757 (7th Cir. 2011).

The tally of ballots certified by Defendants giving Mr. Biden the lead with 20,800 votes cannot possibly stand in light of the thousands of illegal mail-in ballots that were improperly counted and the vote manipulation caused by the Dominion software.

Plaintiffs' equal protection claim is straightforward. The right of qualified citizens to vote in a state election involving federal candidates is recognized as a fundamental right under the Fourteenth Amendment of the United States Constitution. *Harper v. Va. State Bd. of Elections*, 383 U.S. 663, 665 (1966). *See also Reynolds v. Sims,* 377 U.S. 533, 554 (1964) (The Fourteenth Amendment protects the "the right of all qualified citizens to vote, in state as well as in federal elections."). Indeed, ever since the Slaughter-House Cases, 83 U.S. 36 (1873), the United States Supreme Court has held that the Privileges or Immunities Clause of the Fourteenth Amendment protects certain rights of federal citizenship from state interference, including the right of citizens to directly elect members of Congress. *See Twining v. New Jersey*, 211 U.S. 78, 97 (1908) (citing Ex parte Yarbrough, 110 U.S. 651, 663-64 (1884)). *See also Oregon v. Mitchell*, 400 U.S. 112, 148-49 (1970) (Douglas, J., concurring) (collecting cases).

The fundamental right to vote protected by the Fourteenth Amendment is cherished in our nation because it "is preservative of other basic civil and political rights." *Reynolds*, 377 U.S. at 562; *League of Women Voters of Ohio v. Brunner*, 548 F.3d 463,476 (6th Cir. 2008) ("The

right to vote is a fundamental right, preservative of all rights."). Voters have a "right to cast a ballot in an election free from the taint of intimidation and fraud," *Burson v. Freeman*, 504 U.S. 191, 211 (1992), and "[c]onfidence in the integrity of our electoral processes is essential to the functioning of our participatory democracy." *Purcell v. Gonzalez*, 549 U.S. 1, 4 (2006) (per curiam).

"Obviously included within the right to [vote], secured by the Constitution, is the right of qualified voters within a state to cast their ballots and have them counted" if they are validly cast. *United States v. Classic*, 313 U.S. 299, 315 (1941). "[T]he right to have the vote counted" means counted "at full value without dilution or discount." *Reynolds*, 377 U.S. at 555, n.29 (quoting *South v. Peters*, 339 U.S. 276, 279 (1950) (Douglas, J., dissenting)).

"Every voter in a federal . . . election, whether he votes for a candidate with little chance of winning or for one with little chance of losing, has a right under the Constitution to have his vote fairly counted, without its being distorted by fraudulently cast votes." *Anderson v. United States,* 417 U.S. 211, 227 (1974); *see also Baker v. Carr,* 369 U.S. 186, 208 (1962). Invalid or fraudulent votes "debase[]" and "dilute" the weight of each validly cast vote. *See Anderson*, 417 U.S. at 227.

The right to an honest [count] is a right possessed by each voting elector, and to the extent that the importance of his vote is nullified, wholly or in part, he has been injured in the free exercise of a right or privilege secured to him by the laws and Constitution of the United States." *Anderson*, 417 U.S. at 226 (*quoting Prichard v. United States*, 181 F.2d 326, 331 (6th Cir.), *aff'd due to absence of quorum*, 339 U.S. 974 (1950)).

Practices that promote the casting of illegal or unreliable ballots or fail to contain basic minimum guarantees against such conduct, can violate the Fourteenth Amendment by leading to the dilution of validly cast ballots. *See Reynolds*, 377 U.S. at 555 ("[T]he right of suffrage can be

denied by a debasement or dilution of the weight of a citizen's vote just as effectively as by wholly prohibiting the free exercise of the franchise."). States may not, by arbitrary action or other unreasonable impairment, burden a citizen's right to vote. *See Baker v. Carr*, 369 U.S. 186, 208 (1962) ("citizen's right to a vote free of arbitrary impairment by state action has been judicially recognized as a right secured by the Constitution").

"Having once granted the right to vote on equal terms, the state may not, by later arbitrary and disparate treatment, value one person's vote over that of another." *Bush*, 531 U.S. at 104-05. Among other things, this requires "specific rules designed to ensure uniform treatment" in order to prevent "arbitrary and disparate treatment of voters." *Id*. at 106-07; *see also Dunn v. Bloomstein*, 405 U.S. 330, 336 (1972) (providing that each citizen "has a constitutionally protected right to participate in elections on an equal basis with other citizens in the jurisdiction"). Similarly, equal protection needs to be recognized in this case where many Wisconsin's citizens' lawful votes remained uncounted, and many were diluted by unlawful votes in violation of the Equal Protection clause.

The Plaintiff Will Suffer Irreparable Harm

"Where, as here, plaintiff has demonstrated a likelihood of success on the merits as to a constitutional claim, such an injury has been held to constitute irreparable harm." *Democratic Nat'l Comm. v. Bostelmann*, 447 F.Supp.3d 757, 769 (W.D. Wis. 2020) (*citing Elrod v. Burns*, 427 U.S. 347, 373, 96 S.Ct. 2673, 49 L.Ed.2d 547 (1976) (where plaintiff had proven a probability of success on the merits, the threatened loss of First Amendment freedoms "unquestionably constitutes irreparable injury"); *see also Preston v. Thompson*, 589 F.2d 300, 303 n.4 (7th Cir. 1978) ("The existence of a continuing constitutional violation constitutes proof of an irreparable harm.").

Moreover, courts have specifically held that infringement on the fundamental right to vote constitutes irreparable injury. *See Obama for Am. v. Husted*, 697 F.3d 423, 435 (6th Cir. 2012) ("A restriction on the fundamental right to vote ... constitutes irreparable injury."); *Williams v. Salerno*, 792 F.2d 323, 326 (2d Cir. 1986) (holding that plaintiffs "would certainly suffer irreparable harm if their right to vote were impinged upon")." \

"Additionally, traditional legal remedies would be inadequate, since infringement on a citizens' constitutional right to vote cannot be redressed by money damages." *Bostelmann*, 447 F.Supp.3d at 769 (*citing Christian Legal Soc'y v. Walker*, 453 F.3d 853, 859 (7th Cir. 2006) ("The loss of First Amendment freedoms is presumed to constitute an irreparable injury for which money damages are not adequate."); *League of Women* Voters *of N. Carolina v. North Carolina*, 769 F.3d 224, 247 (4th Cir. 2014) ("[O]nce the election occurs, there can be no do-over and no redress.")."

The Balance of Harms & Public Interest

Under Seventh Circuit law, a "sliding scale" approach is used for balancing of harms: "[t]he more likely it is that [the movant] will win its case on the merits, the less the balance of harms need weigh in its favor." *Girl Scouts of Manitou Council v. Girl Scouts of United States of Am., Inc.*, 549 F.3d 1079, 1100 (7th Cir. 2008). Plaintiff above have shown his strong likelihood of success on the merits above. The low costs to Defendants and high potential harm to Plaintiff make this a case with a substantial net harm that an immediate and emergency injunctive relief can prevent.

In this regard, Plaintiff would highlight a recent Eleventh Circuit decision addressed a claim in 2018 related to Georgia's voting system and Dominion Voting Systems that bears on the likelihood of Plaintiffs' success on the merits and the balance of harms in the absence of injunctive relief:

> In summary, while further evidence will be necessary in the future, the Court finds that the combination of the statistical evidence and witness declarations in the record here (and the expert witness evidence in the related *Curling* case which the Court takes notice of) persuasively demonstrates the likelihood of Plaintiff succeeding on its claims. Plaintiff has shown a substantial likelihood of proving that the Secretary's failure to properly maintain a reliable and secure voter registration system has and will continue to result in the infringement of the rights of the voters to cast their **vote** and have their **votes** counted.

Common Cause Georgia v. Kemp, 347 F. Supp. 3d 1270, 1294-1295, (11th Cir. 2018).

Therefore, it is respectfully requested that the Court grant Plaintiffs' Motion and enter the proposed Order submitted therewith.

Respectfully submitted, this 6th day of December, 2020.

IN THE UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff, **CASE NO. 2:20-cv-1771**

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

PLAINTIFF'S MOTION FOR LEAVE TO SUBMIT SEPARATE REPLIES TO MULTIPLE SUBMISSIONS BY DEFENDANTS AND AMICI OPPOSING PLAINTIFF'S AMDEND MOTION FOR TEMPORARY RESTRAINING ORDER AND PRELIMINARY INJUNCTION TO BE CONSIDERED IN AN EXPEDITED MANNER

COMES NOW Plaintiff, William Feehan by and through his undersigned counsel, and moves the Court to permitting him to submit separate or consolidated replies of 15 pages each to each of the multiple submissions of Defendants and Amici in opposition to Plaintiff's Motion for Temporary Restraining Order and Preliminary Injunction to Be Considered in an Expedited Manner (Amended Motion).

In support, Plaintiff shows:

1) By Order dated December 4, ECF Docket No. 29, the Court referenced "Civil L.R. 7(f), which provides that memoranda in opposition to motions are limited to thirty pages and reply briefs in support of motions are limited to fifteen pages."

2) Civil Local Rule 7(f) further provides that briefs may not exceed those page limits "unless the Court has previously granted leave to file an oversized memorandum."

3) By the same Order, the Court directed Defendants Gov. Tony Evers and Wisconsin Elections Commission to file an "opposition brief" to Plaintiff's Amended Motion by 5:00 p.m. on Monday, December 7, 2020, and directed Plaintiff to file his reply by 5:00 p.m. on Tuesday, December 8.

4) While the reference is to a single brief, Defendants are represented by separate counsel, and Plaintiff anticipates that each Defendant will file a separate 30 page brief in opposition to Plaintiff's Amended Motion.

5) Subsequently on December 4, Defendant Gov. Tony Evers filed a Motion Requesting Leave to File an Oversized Memorandum of 45 pages in support of his proposed Motion to Dismiss and in response to Plaintiff's Amended Motion. ECF Docket No. 34.

6) By Text Order dated December 4, ECF Docket No. 36, the Court indicated the Court would allow Gov. Tony Evers leave to file "separate briefs opposing the plaintiff's amended motion and supporting his own." Pursuant to Civil L. R. 7(f), the separate brief apparently may be 30 pages as well.

7) By Order dated December 4, ECF Docket No. 37, the Court granted leave to proposed Intervenor James Gesbeck to file an *amicus* brief of 30 pages opposing Plaintiff's Amended Motion.

8) By Order dated December 6, ECF Docket No. 41, the Court granted leave to proposed Intervenor Democratic National Committee to file an *amicus* brief opposing Plaintiff's Amended Motion for Temporary Restraining Order, also presumably 30 pages, the same as *Amici* Gesbeck.

9) The total page limit of opposition to Plaintiff's Amended Motion may therefore total as many as 150 pages.

10) Under the Court's December 4 Order, Docket No. 29, Plaintiff is apparently limited, at present, to a single 15 page reply in response to the total 150 pages filed in opposition.

11) While Plaintiff may well not file a 15 page Reply to each and every submission, Plaintiff cannot anticipate all arguments raised by multiple Defendants and Amici, and in any event, a limit of 15 pages is inadequate to reply to up to 150 pages of opposing submissions by Defendants and *Amici.*

CONCLUSION

Based on the Court's stated preference that Gov. Evers file separate briefs supporting his Motion to Dismiss and opposing Plaintiff's Amended Motion, Plaintiff therefore requests leave to file a separate Reply to each opposing submission, each Reply not to exceed 15 pages.

Respectfully submitted, this 6th day of December, 2020.

IN THE UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff, **CASE NO. 2:20-cv-1771**

v.

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

PLAINTIFF'S MOTION FOR CONSOLIDATED EVIDENTIARY HEARING AND TRIAL ON THE MERITS

COMES NOW Plaintiff, William Feehan by and through his undersigned counsel, and moves the Court to schedule an evidentiary hearing on the merits at 9 a.m., Wednesday, December 9, 2020, or at the Court's earliest opportunity other than on Thursday, December 10, 2020. This Motion is brought pursuant to FRCP 65.

In support, Plaintiff shows:

1) FRCP 65(a) provides:

> **(a) Preliminary Injunction.**
>
> **(1)** ***Notice.*** The court may issue a preliminary injunction only on notice to the adverse party.
>
> **(2)** ***Consolidating the Hearing with the Trial on the Merits.*** Before or after beginning the hearing on a motion for a preliminary injunction, the court may advance the trial on the merits and consolidate it with the hearing. Even when consolidation is not ordered, evidence that is received on the motion and that would be admissible at trial becomes part of the trial record and need not be repeated at trial. But the court must preserve any party's right to a jury trial.

2) As the Court is likely aware, prior to filing this Case No. 2:20-cv-1771, Plaintiffs' Counsel commenced similar actions in several other jurisdictions, based upon evidence provided in the Affidavits and Declarations the same or similar to those of Plaintiff's expert witnesses supporting Plaintiff's Amended Complaint in this case.

3) Because Plaintiff's counsel had concluded that December 8 was the final date for determining injunctive relief and because Plaintiff's expert witnesses could not be available in multiple courts at once, Plaintiff proposed to proceed based on the expert witness and other documentary evidence provided in the Exhibits to his Complaint, which Plaintiff asserts satisfies the evidentiary standard for a Temporary Restraining Order in any event. Pl. Amended Memorandum at 5 – 8.

4) However, pursuant to its Order dated December 4, ECF Docket No. 29, the Court has determined that December 14 is the final date for determination rather than December 8. Further, except for Thursday, December 10, scheduling ordered in the other jurisdictions has now made it possible for Plaintiff's experts to appear before this Court on Wednesday, December 9 or thereafter.

5) Also, counsel who have appeared on behalf of Defendants and *amici* proposed intervenors in this action have appeared on behalf of similarly situated defendants in other jurisdictions. Based upon their filings in those jurisdictions and the responsive pleadings proposed by *amici* in this action, it is clear that defendants intend to argue, *inter alia*, that relief should not be granted apart from an evidentiary determination on the merits.

6) In its December 4 Order, the Court contemplated "exercis[ing] its discretion whether to hold an evidentiary hearing or hear argument." *Id.* at 3 – 4.

7) Plaintiff's reply briefing will be submitted by 5:00 p.m., Tuesday, December 8.

8) A consolidated hearing/trial on December 9 under Rule 65(a)(2) would provide the Court a more thorough basis for its decision than the documentary evidence available to date, and would make possible a final order with at least a minimal window of several days available for appeal.

9) Plaintiff would present three witnesses and estimates the entire hearing could be concluded in three hours.

CONCLUSION

Accordingly, the Plaintiff respectfully requests the Court to schedule a consolidated hearing/trial on the merits commencing at 9 a.m., December 9, 2020.

Respectfully submitted, this 6th day of December, 2020.

IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff,

v. Case No. 20-CV-1771

WISCONSIN ELECTIONS COMMISSION, and its members ANN S. JACOBS, MARK L. THOMSEN, MARGE BOSTELMAN, JULIE M. GLANCEY, DEAN KNUDSON, ROBERT F. SPINDELL, JR., in their official capacities, GOVERNOR TONY EVERS, in his official capacity,

Defendants.

DEFENDANTS WISCONSIN ELECTIONS COMMISSION AND ITS MEMBERS' RESPONSE TO TO PLAINTIFF'S MOTION FOR HEARING

This case should proceed on the schedule that has already been ordered. Plaintiff's delayed reversal of position and request for an evidentiary hearing this week with unidentified witnesses is prejudicial, impractical, and would not advance resolution of this case. For reasons detailed in the Commission's filings later today, the injunction and this entire case can and should be resolved on briefs. In any event, the Commission has already relied on the Plaintiff's request to not have a hearing when scheduling other cases, and a

hearing this week is impractical. Plaintiff's delayed scheduling request should be denied for four reasons.

First, this request represents quintessential sandbagging. Plaintiff initially filed his motion for a temporary restraining order and preliminary injunction on December 1 without asking for a hearing. (*See* Dkt. 2.) He then amended that motion later that day, again, without requesting a hearing (*see* Dkt. 6), which the Court acknowledged in its December 2 order (Dkt. 7). The next day, December 3, Plaintiff submitted a third amended motion and proposed a briefing schedule "to submit the matter on briefs without argument." (Dkt. 10-1:1.) Plaintiff's third amended motion expressly states that it "present material dispositive issues which are questions of law that may be resolved without factual investigation or determination." (Dkt. 10 ¶ 6.) The court granted that request and scheduled briefing. (Dkt. 29:6) ("But because that is what the plaintiff—the movant—has asked, the court will rule on the pleadings.") Now, at 9:00 p.m. on the Sunday evening before Defendants' briefs are due, Plaintiff decides to change his direction and requests an evidentiary hearing to present three mystery witnesses. This type of sandbagging is inexcusable.

Second, the Commission would be prejudiced by Plaintiff's sandbagging. It has relied on Plaintiff's prior request to *not* have a hearing when scheduling other hearings, and its witnesses cannot now reasonably prepare and may not

be available given other proceedings. This week, there is a pretrial hearing on Wednesday and a hearing on Thursday in another election case in federal court brought by Donald J. Trump. *Donald J. Trump v. The Wisconsin Elections Comm'n*, No. 20-cv-1785-bhl (E.D. Wis.) (*See* Dkt. 45 noting that a final pretrial conference is scheduled for Wednesday, December 9, 2020, at 3:00 p.m., and a final evidentiary hearing is scheduled on Thursday, December 10, 2020 at 9:00 a.m.) There is a hearing on Friday in a state-court case where Donald J. Trump brings election claims through the state procedures under Wis. Stat. § 9.01. *Donald J. Trump vs. Joseph R. Biden*, No. 20CV7092 (Wis. Cir. Ct. Milwaukee Cty.) (scheduling a hearing for Friday, December 11, 2020 at 9:00 a.m.). And Wisconsin Assembly Speaker Robin Vos and Majority Leader Rep. Jim Steineke have announced the Assembly Committee on Campaigns and Elections will host a public hearing on the 2020 presidential election scheduled for December 11, 2020, at 10:00 a.m. in the Wisconsin State Capitol.

An evidentiary hearing here will require the same Commission witness or witnesses who need to prepare for hearings on Thursday and Friday. Adding a hearing on Wednesday, or any other day this week, is unacceptably burdensome and prejudicial.

Further, the Commission relied on the Plaintiff's request to not have a hearing and has not requested expedited discovery or deposed any of Plaintiff's purported experts or other witnesses—some of which are not even identified in

their declarations. Astoundingly, Plaintiff fails to even identify which three witnesses he intends to present at a hearing he proposes to occur in days. Plaintiff's tactics are inexcusable and should not be entertained by the court. *See*, *Stern v. Marshall*, 564 U.S. 462, 482 (2011) (admonishing plaintiff's "sandbagging" and noting that the consequences "can be particularly severe.")

Third, no evidentiary hearing is necessary. As will be explained in detail in the Commission's response brief to be filed later today, Plaintiff's case has multiple threshold defects that require dismissal on the pleadings. Plaintiff lacks standing, his inexplicably late claim is barred by laches, and the relief he requests is barred by the Eleventh Amendment and Substantive Due Process Clause. Plaintiff's individual causes of action fair no better and he has not stated any constitutional claims as a matter of law.

Finally, what Plaintiff likely intends to present at any evidentiary hearing is inadmissible under *Daubert* and the Federal Rules of Evidence. The glaring unreliability, and inadmissibility of the evidence that Plaintiff filed in support of his injunction request will be further explained in the Commission's response brief to be filed later today. The documents filed with his Complaint and brief do not even meet basic evidentiary standards and cannot possibly support overturning the results of the election.

Plaintiff's late reversal of position does not warrant prejudicing the Commission with an evidentiary hearing the day after tomorrow. The

Commission requests that this case proceed on the schedule that is already established.

Dated this 7th day of December 2020.

UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF WISCONSIN

WILLIAM FEEHAN,

Plaintiff,

Case No. 2:20-cv-1771

v.

WISCONSIN ELECTIONS COMMISSION, *et al.*

Defendants.

JAMES GESBECK'S AMICUS BRIEF IN OPPOSITION TO PLAINTIFF'S MOTION FOR INJUNCTIVE RELIEF (DKT. NO. 10)

James Gesbeck files this *amicus*[1] brief in opposition to plaintiff's motion for injunctive relief. Dkt. No. 10. Plaintiff seeks a temporary restraining order or preliminary injunction "set[ting] aside the results of the 2020 General Election" and granting other relief. Id at ¶ 5. Among the relief requested by plaintiff are various orders directed at Governor Evers and the Wisconsin Elections Commission. One of the requested orders is "An order requiring Governor Evers to transmit certified election results that state that President Donald Trump is the winner of the election". Dkt. No. 9 at ¶ 142. This would be an unprecedented order in the history of the United States of America. Even in the seminal Bush v Gore case, the court did not order Florida to transmit certified election results stating that Bush was the winner of the election. 531 U.S. 98, 111 (2000).

Plaintiff's motion for injunctive relief fails before even reaching the merits. Plaintiff has brought this case in Federal Court asserting a variety of Constitutional violations; however,

[1] Pursuant to Judge Pepper's Order. Dkt. No. 37.

plaintiff has not established this court has jurisdiction. Dkt. No. 9. Plaintiff was a nominee of the Republican Party to be a Presidential Elector for Wisconsin. Id. at ¶ 24. Plaintiff is not the correct party to be challenging the 2020 General Election results and this Federal Court is not the proper jurisdiction in which the challenge should be heard. The Constitution provides that the power to appoint Electors is vested in the Legislature of each State. U.S. CONST. art. II, § 1 ("Electors Clause"). The Wisconsin Legislature has directed that challenges to an election are to be brought in Wisconsin Circuit Courts by an aggrieved party. Wis. Stat. § 9.01(6). In the Presidential Election the aggrieved party is Donald Trump. Wis. Stat. § 9.01(1)(a)(5)(b). To the extent that the results of this election need to be challenged, Donald Trump is the correct plaintiff, and the Wisconsin Circuit Court is the correct venue. In fact, Donald Trump is the plaintiff in Milwaukee County Circuit Case 2020CV7092 which is an appeal of a recount brought under Wis. Stat. § 9.01.

The plaintiff further fails to meet any of the standards for a temporary restraining order or preliminary injunction.

Plaintiff fails to make an initial showing that plaintiff is likely to succeed on the merits. Plaintiff relies on numerous affidavits, including anonymous affidavits, as evidence of a "massive election fraud" Dkt. No. 9 at ¶ 1. But plaintiff's affidavits contain irrelevant information about elections occurring in other States and other Countries and contain no specific allegations of election misconduct occurring in Wisconsin during the 2020 General Election.

Plaintiff claims to have no adequate remedy at law, however plaintiff does not further argue how that is the case. Plaintiff's remedy for these alleged violations is to have the aggrieved party under Wis. Stat. § 9.01(1)(a)(5)(b) challenge the recount under Wis. Stat. § 9.01(6) which is exactly what is occurring in Milwaukee County Circuit Case 2020CV7092.

Plaintiff further will not suffer any harm, let alone, irreparable harm if the court denies plaintiff's motion. If the plaintiff's factual allegations and claim of a "massive election fraud" are true, then Trump will prevail in Milwaukee County Circuit Case 2020CV7092. If Trump prevails in that, then regardless of what occurs in this case, plaintiff will have suffered no harm. In fact, plaintiff would be one of the Wisconsin Electors voting for Donald Trump in the Electoral College.

Plaintiff argues that the balance of equities would favor plaintiff's proposed remedy. However, nothing could be further from the truth. Plaintiff's proposed remedy is unprecedented. It would result in this court ordering Governor Evers to certify that Donald Trump won the State of Wisconsin in contradiction to the outcome obtained by operation of Wisconsin's election law enacted by the legislature pursuant to Article II of the Constitution. This would disenfranchise every single individual who voted in the 2020 General Election. Plaintiff does not seek the exclusion of certain fraudulent ballots or the removal of certain fraudulent additions to the tallies, rather plaintiff seeks wholesale disenfranchisement of every single Wisconsin voter. The equitable outcome in this case is for this court to deny the plaintiff's motion for an injunction and allow the election challenge occurring pursuant to the process outlined by the Wisconsin legislature under the authority granted to it by Article 2 of the Constitution.

Plaintiff proposed order would be extraordinarily harmful to the citizens and voters of the State of Wisconsin and thus the public. If plaintiff's motion is granted, then this court, acting alone, would be dictating the results of this election. This court would be disenfranchising every single voter and discarding every single vote in the State of Wisconsin by ordering the Governor to certify an election result dictated by this court. There are no examples of a court deciding an election itself. Rather, courts have ruled on the application of election law to specific ballots or

sets of ballots. The election process then proceeds pursuant to election law and a winner is determined. Judges do not and should not declare electoral winners as opposed to changing the tallies.

BACKGROUND

FACTUAL BACKGROUND

It is undisputed that the 2020 General Election took place in Wisconsin on November 3rd, 2020. As part of that election, voters participated in selecting the winner of Wisconsin's 10 Electoral votes. Wis. Stat. Chapters 5-12. Joseph Biden and Donald Trump were the two highest vote getters in the election for the office of the President of the United States. The Wisconsin Elections Commission pre-recount canvass reported 1,630,673 for Joseph Biden and 1,610,065 for Donald Trump[2]. Based on that outcome, Wisconsin election law would dictate that the Wisconsin Elections Commission and Governor Evers certify the Electors for Joseph Biden. Id.

The 2020 General Election in Wisconsin was unique as far as General Elections in Wisconsin are concerned. The court can take judicial notice that there is a global health pandemic taking place caused by the COVID-19 virus. This resulted in "astronomically more ballots case by mail than in any previous fall election in Wisconsin"[3]. Further complicating the election were public safety precautions necessitated by COVID-19[4]. The Center for Disease Control recommends social distancing which includes keeping 6 feet away from other people[5]. This complicated the ballot counting process and voting process as elections staff worked to keep

people 6 feet apart. Additionally, absentee ballots in Wisconsin cannot be counted until the day of the election. Wis. Stat. § 6.88.

The difference in votes between Trump and Biden was 20,608 votes. This is within the 1% margin of votes cast required for a recount. Wis. Stat. § 9.01(1)(a)(5)(b). On November 18th, President Trump filed a timely petition for a recount pursuant to Wis. Stat. § 9.01(1)(a)(1). Pursuant to Wis. Stat. § 9.01(1)(a)(3), Trump only requested a recount take place in Dane County and Milwaukee County[6]. That recount was conducted in both Dane County and Milwaukee County. Milwaukee County performed their recount by hand[7]. The partial recount led to a final canvass of Biden having 1,630,866 votes and Trump having 1,610,184 votes[8].

Following the recount, Trump filed a petition for Original Action in the Wisconsin Supreme Court as appeal number 2020AP1971-OA. The Wisconsin Supreme Court entered a December 3rd Order denying the petition for leave to commence an original action[9]. The Wisconsin Supreme Court specifically noted that Wis. Stat. § 9.01(6) required such an action be commenced in circuit court. Trump then filed two cases, one each in Dane County and Milwaukee County. These were ultimately consolidated into Milwaukee County Circuit Case 2020CV7092 before Judge Simanek. Further case filings are expected December 7th and 9th in advance of a December 10th or December 11th hearing.

PLAINTIFF'S ALLEGED FACTS

The plaintiff has alleged a massive election fraud that "occurred during the 2020 General Election in the City of Milwaukee, southeastern Wisconsin counties, and throughout the State of

[9] https://www.wicourts.gov/sc/opinion/DisplayDocument.pdf?content=pdf&seqNo=311669

Wisconsin". Dkt. No. 9 at ¶ 1. Plaintiff's amended complaint contains numerous factual allegations and includes numerous exhibits. Dkt. No. 9-1 through 9-19. Those exhibits include various affidavits, although several affidavits have the name of the affiant redacted. E.g., Dkt. No. 9-1. While this could be cause for concern, most of the affidavits are wholly irrelevant to the matter before this court. For this court to find that massive election fraud during the 2020 General Election in Wisconsin, there must be a factual basis demonstrating that such fraud occurred. That evidence is simply missing from the plaintiff's pleadings. In fact, plaintiff fails to meet any of the requirements for a preliminary injunction even assuming the testimony of the affiants is true.

Dkt. No. 9-1 is an affidavit regarding elections occurring in Venezuela. However, the only connection between that affidavit and the 2020 General Election in the State of Wisconsin is that the same vendor may have supplied voting equipment in both Venezuela and in the State of Wisconsin. Id. Importantly, while the affidavit outlines electoral fraud that occurred in Venezuela, it does not allege any fraud in Wisconsin and is thus irrelevant. Dkt. No. 9-8 also contains more allegations regarding Venezuela that again are irrelevant to the Wisconsin election. The question of whether election fraud occurred in Venezuela is not relevant to the question presented before this court of whether there was election fraud in the Wisconsin 2020 General election.

Plaintiff's 2nd and 3rd exhibits reference various statistical analyses performed based on a poll of Wisconsin residents. Dkt. No. 9-1 and 9-2. The problem with this is that it relies on a poll conducted by the affiant's staff. Polls are simply not accurate as by definition they are limited to a sample size and further limited based on the individuals who respond to them. Individuals who respond are notably not under oath. Plaintiff's 9th exhibit similarly looks at voting trends and

concludes only there were "strikingly high Democratic vote totals". Dkt. No. 9-9. There is nothing inherently illegal or fraudulent in "strikingly high Democratic vote totals" and there is no allegation in that affidavit that these vote totals were the product of fraud.

As an example of inherent unreliability of polls, polls were inaccurate both in the 2016 General Election in Wisconsin and in this election. In 2016 the polls predicted a Clinton victory in Wisconsin which turned out to be inaccurate[10]. One 2020 poll had Biden winning Wisconsin by 17 points[11]. These limitations are the reason why we rely on holding actual elections and not selecting winners based on polling. This court should not and cannot order Governor Evers to declare a certain individual the winner of an election solely based on statistical analysis.

Plaintiff's 4th exhibit attempts to show "something unusual" occurring with Dominion Voting Systems machines based on a statistical analysis. Dkt. No. 9-4. However, missing from this is any evidence showing what this "something unusual" or even a suggestion of what "something unusual" might be. Given the other affidavits showing electoral fraud occurring in other countries using Dominion Voting System machines perhaps plaintiff wants the court to view the evidence in that manner. However, there are no facts to suggest, let alone prove, that something fraudulent occurred in Wisconsin.

Plaintiff's 5th exhibit simply outlines the hardware in use at each Wisconsin Municipality. Dkt. No. 9-5. Plaintiff's 6th exhibit concerns an individual named Eric Coomer who supposedly works at Dominion Voting System and is apparently biased against Trump. Dkt. No 9-6. In the light most favorable to the plaintiff, Eric Coomer made a statement that he made sure Trump was not going to win the election. Id. However, there is nothing in the affidavit to indicate that Eric

[10] https://www.nytimes.com/newsgraphics/2016/10/18/presidential-forecast-updates/newsletter.html
[11] https://abcnews.go.com/Politics/covid-surge-hurts-trump-wisconsin-biden-leads-closer/story?id=73834112

Coomer did anything, let alone something that would interfere specifically in the 2020 Wisconsin General election which is what plaintiff must prove.

Plaintiff's 7th, 8th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, and 18th exhibit describes vulnerabilities found in voting systems in various places, but notably none of them reference Wisconsin. Dkt. No. 9-7, 9-8, 9-10, 9-11, 9-12, 9-13, 9-14, 9-15, 9-16, and 9-18. Whether other Dominion Voting Systems are vulnerable is simply not relevant to what occurred in Wisconsin. Additionally, the mere presence of a security vulnerability in Wisconsin does not mean that it was exploited, and electoral fraud occurred. Plaintiff does not have any evidence in the affidavits that any election machines in Wisconsin were exploited and votes changed.

Plaintiff's 17th exhibit contains several factual statements which ends in a conclusion that fraud occurred. Dkt. No. 9-17. One of the supposed indicators of fraud are higher than normal voter turnout. Additionally, there was a spike of votes that did not come from a random population of votes. While these facts are interesting, and possibly grounds for further investigation, there is no factual allegation of fraud beyond pure conjecture that it occurred. This court cannot grant plaintiff's motion based on conjecture in the absence of facts demonstrating that election fraud actually occurred in Wisconsin during the 2020 General Election.

Plaintiff's 19th exhibit performs a statistical analysis of voting trends, and it purports the outcome of this analysis to be show "fraud". Dkt. 9-19. The problem is there are no further factual allegations to indicate that it was in fact fraud, what the fraud was, who carried out the fraud and other factually important questions. There may be other explanations, and this does appear to warrant further investigation. However, it is insufficient evidence for this court issue a preliminary injunction.

PLAINTIFF'S MISSING FACTS

It is important to examine the factual claims that are remarkably absent from plaintiff's affidavits. This court is being asked to apply the law to the facts that are present. However, it is the facts that are absent that truly demonstrate plaintiff's inability to succeed on the merits.

There is no allegation of fraudulent misconduct on the part of the named defendants or any person associated with conducting the Wisconsin election. For the plaintiff to succeed with a claim of "massive election fraud" there would need to be one or more persons who committed fraud. However, the plaintiff does not allege any specific individual committed fraud and does not allege with particularity the circumstances constitution fraud as required under Fed. R. Civ. P. 9(b).

There is further no evidence presented that votes were not counted, ballots were added, or that voters were denied the right to vote. At best the plaintiff's evidence demonstrates that fraud could be explanation for statistically significant events that occurred. So, at best, plaintiff shows there is a possibility of fraud. However, the mere possibility of harm (in this case fraud) is not even enough for Article 3 standing in Federal courts. See Clapper v. Amnesty Int'l USA, 568 U.S. 398 (2013). As a matter of law, it is certainly not enough to prove that massive election fraud occurred.

Further missing from the plaintiff's factual claims are an accounting of what the vote total should be. Plaintiff solely cites various statistical analysis for the proposition that Trump should have won the election in the State of Wisconsin. However, the plaintiff offers no method for calculating what accurate vote totals would even be. Instead, plaintiff requests that this court disenfranchise every single voter and declare by fiat who won the election for the office of the President of the United States.

LEGAL STANDARD

Plaintiff correctly cites the standard for a temporary restraining order or preliminary injunction[12]. "A preliminary injunction is an extraordinary remedy that is only granted where there is a clear showing of need." Cooper v. Salazar, 196 F.3d 809 (1999). "[Plaintiffs must show 1) a likelihood of success on the merits, 2) irreparable harm if the preliminary injunction is denied, and 3) the inadequacy of any remedy at law. Once this threshold showing is made, the court balances 4) the harm to plaintiffs if the preliminary injunction were wrongfully denied against the harm to the defendant if the injunction were wrongfully granted, and 5) the impact on persons not directly concerned in the dispute (the "public interest")" Id.

In addition to the legal standard for a preliminary injunction, it is important to consider the legal standard applicable to the Wisconsin Election Code. Wis. Stat. Chapters 5-12. The authority of Wisconsin to regulate its election is vested in its legislature by the United States Constitution. U.S. CONST. art. II, § 1 ("Electors Clause"). Therefore, in considering this challenge to a Wisconsin election this court must consider and analyze Wisconsin law.

Any analysis of Wisconsin election law must begin with Wis. Stat. § 5.01(1). "Construction of chs. 5 to 12. Except as otherwise provided, chs. 5 to 12 *shall be construed to give effect to the will of the electors*, if that can be ascertained from the proceedings, *notwithstanding informality or failure to fully comply with some of their provisions*". Id (emphasis added). The legislature has expressed its clear intent that its statutory regulation of election give effect to the will of the electors. Further, even the failure to fully comply with some of the provisions of chs. 5 to 12 should not prevent effect being given to the will of electors. Id.

[12] To the extent there may be a difference between a temporary restraining order or preliminary injunction, such differences are irrelevant in this case. Plaintiff seeks a nondispositive court order requiring defendants to take certain actions and abstain from taking other actions.

The legislature has specified an exception to certain absentee voting requirements as set out in 6.84(2) which instructs that those provisions should be treated as mandatory provisions as opposed to directory provisions. Wis Stat. § 6.84(2). This is relevant as the Wisconsin Supreme Court has held that directory provisions only require substantial compliance as opposed to strict compliance. See e.g., Sommerfeld v. Board of Canvassers, 269 Wis. 299, 69 N. W. (2d) 235 (1955) and Kaufmann v. La Crosse City Board of Canvassers, 8 Wis. 2d 182 (1959)

PLAINTIFF IS NOT ENTITLED TO A PRELIMINARY INJUNCTION

Plaintiff has not established the subject matter jurisdiction of this court

For plaintiff to succeed on the merits, plaintiff must show that this court properly has subject matter jurisdiction. Plaintiff claims this court has subject matter jurisdiction granted by 28 U.S.C. § 1343. Plaintiff further cites Bush v. Gore for the proposition that "A significant departure from the legislative scheme for appointing Presidential electors presents a federal constitutional question." 531 U.S. 98, 113 (2000) (Rehnquist, C.J., concurring). This quote is taken from a concurring opinion, not the majority opinion. Additionally, the majority opinion said the decision was limited to the facts of the case before the Supreme Court. Id. at 109.

Notably, plaintiff does not allege a significant departure from the legislative scheme for appointing Presidential electors in Wisconsin. Plaintiff alleges perhaps a minor departure of the legislative scheme in two manners. First, that WEC guidance that indefinitely confined absentee requests should not be changed based on what a clerk "believes" departs from the legislative scheme that requires a clerk have "reliable information". Dkt. No. 9 at ¶ 40-41. As a legal matter, a subjective belief that someone does not meet the requirements for indefinitely confined status is not the same as having reliable information that someone does not meet the requirements for

the indefinitely confined status. Thus, there is no conflict between the guidance issued by the WEC and the legislative scheme for conducting elections.

Second, plaintiff alleges that addresses were added by clerks to the witness certification of absentee ballots. Id. at ¶ 43. Plaintiff alleges this departs because there is no explicit grant in the statutes for clerks to add this information and Wis. Stat. § 6.87(6d) requires the witness address be present. However, nothing in the statutory scheme requires that the witness be the individual to fill out the address. Rather the only requirement is that the certification be executed by the witness. Wis. Stat. § 6.88(3)(a). Plaintiff has not alleged and has not offered any evidence showing that any of the ballots did not contain the witness' address. Since there is no requirement that the witness write the address, there has been no violation of the election code.

Since there is no substantial departure from the legislative scheme as required by *Bush v. Gore* to assert standing under 28 U.S.C. § 1343, this court lacks subject matter jurisdiction over these claims. The court should therefore deny the plaintiff's request for a preliminary injunction as Federal Courts should not issue preliminary injunctions when they lack jurisdiction to even hear the case. Since the plaintiff cannot establish subject matter jurisdiction, plaintiff has no chance of succeeding on the merits as is required for a temporary injunction.

In the alternative, the court should defer to the Wisconsin courts pursuant to Article II of the Constitution

Even if the court has subject matter jurisdiction to hear this case, it should defer to the Wisconsin Courts to resolve these claims instead of using supplemental jurisdiction to hear claims of violations of Wisconsin Statutes. 28 U.S.C. § 1367. The authority to regulate elections is left to the legislature in each of the States by the Constitution. U.S. CONST. art. II, § 1 ("Electors Clause"). The Wisconsin legislature decided upon a method for resolving disputes in

Wis. Stat. § 9.01. In cases where a violation of the Wisconsin Election Code is claimed, the matter should be resolved in the Wisconsin Circuit Court. Id. This is already taking place in the form of Milwaukee County Case 2020CV7092.

The plaintiff has not advanced any argument as to why the statutory scheme adopted by the Wisconsin legislature pursuant to Article 2 is inadequate. In Bush v. Gore the case only reached the Federal Court System and the United States Supreme Court after it had been ruled on by the Florida Supreme Court. 531 U.S. 98 (2000). There is no reason offered by the plaintiff as to why such a process should not occur here.

Should Wisconsin courts fail to protect adequately the interests of the public and this plaintiff in having free and fair elections, then, and only then, should the Federal Courts invoke their authority under 28 U.S.C. § 1343. The prospect of a Federal Court usurping the role of a State to decide the identity of its Presidential Electors and order the Governor to appoint a certain slate of Electors would be unprecedented and lacking in Constitutional authorization. Even in Bush v. Gore, the US Supreme Court remanded the case back to the Florida Courts to have them enter further orders, as necessary. Article II of the Constitution does not provide authority for a Federal Court to order a State to appoint certain electors. There is an enormous difference between finding a State Court failed to follow its legislative scheme and requiring that State Court to follow its legislative scheme and what is being requested here which is that this court order a Governor to appoint certain electors.

The doctrine of abstention allows this District Court should decline to exercise its jurisdiction. Colorado River Water Conservation District v. United States, 424 U.S. 800 (1976). The allegations against absentee ballots are the same in both this case and the pending case in Milwaukee County Circuit Court. Given that Article II of the Constitution grants authority for

creating the legislative scheme for selecting Electors to the individual State, this court should allow the State court to resolve the dispute. Plaintiff seeks to establish jurisdiction based on the Wisconsin Elections Commission alleged substantial departing from the legislative scheme for choosing Electors. That legislative scheme is based in State law and therefore should be heard in State court.

Plaintiff fails to establish he is likely to or even could prevail on the merits

Plaintiff alleges three separate violations of the Wisconsin Election Code. However, plaintiff fails to demonstrate how they would succeed on the merits with any of these claims.

First plaintiff claims clerks were given an unlawful directive that they should not "deactivate an absentee request if [they] believe the voter is not indefinitely confined". See WEC May 13, 2020 Guidance Memorandum. Plaintiff suggests this violates Wis. Stat. § 6.86(2)(b) which requires that an absentee voter be removed "upon the receipt of reliable information that an elector no longer qualifies". However, plaintiff makes no argument as to how the guidance violates the statute. There is a different between believing something and having reliable information. It is possible to believe in Santa Claus even in the absence of reliable information that he exists. A clerk could view an individual and form a belief that they are not indefinitely confined, however, viewing a person, by itself, is not sufficient to be reliable information. As the WEC guidance noted, "not all medical illnesses or disabilities are visible".

Second, plaintiff claims clerks do not have the authority to write the witness address onto the absentee ballot certificate. WEC October 18, 2016 Guidance Memorandum. Despite this guidance being in place for four years and multiple elections, the legislature did not adjust the statutory language. The statutory language neither permits, requires, nor prohibits the address information being added by the clerk. Wis. Stat. § 6.87(6d). There is nothing in the election code

requiring that the witness be the individual who completes the address. All that is required is the address be present. Wis. Stat. § 6.87(6d). Plaintiff does not allege any of the addresses were incorrect or missing. Plaintiff further does not allege that the clerk adding the witness address is fraudulent or in any manner changed the outcome of the election. Therefore, there is no violation of Wis. Stat. § 6.87(6d).

Third, plaintiff claims the Wisconsin Elections Commission and Governor Evers illegally certified the election results by not waiting for the time for an appeal under Wis. Stat. § 7.70(5)(a). However, plaintiff cites the wrong provision as this is an election for the Office of President. The correct statute is Wis. Stat. § 7.70(5)(b) which is specific to elections for presidential electors. There is no such time requirement present in Wis. Stat. § 7.70(5)(b).

Plaintiff fails to establish there is no remedy at law

Plaintiff fails to mention in his briefing that the Wisconsin Statutes have a mechanism for resolving election disputes, especially as it relates to claims of fraud or noncompliance with the election code. This is codified in Wis. Stat. 9.01. In fact, Trump, the proper party under 9.01(1)(a)(5)(b) is pursuing such a challenge. The plaintiff's remedy for not being named as an Elector as he believes should have occurred is to wait for his candidate's challenge brought under the Wisconsin Election Code to be heard. The Wisconsin Circuit Court is fully capable of remedying any election issues that have occurred pursuant to its statutory authority granted by the legislature. The Wisconsin Circuit Court has the authority to set aside or modify the determination of a board of canvassers based on an erroneous interpretation of law and can make factual determinations if necessary. Wis. Stat. § 9.01(8)(d). Further, the Circuit Court is aware of the time challenges involved due to the scheduled electoral vote on Wednesday December 14th

and should be trusted to rule on Trump's challenge pursuant to Wis. Stat. § 9.01(7)(b) which requires the matter "shall be summarily heard and determined".

Plaintiff fails to establish any harm, let alone irreparable harm

As mentioned above, for allegations of a massive election fraud, Wisconsin has a procedure for handling those allegations. Wis. Stat. § 9.01. The legislature duly enacted that process under its authority granted by the U.S. Constitution. The plaintiff's alleged harm of an invalid vote tally is being addressed through that process which is ongoing in Milwaukee County Circuit Court Case 2020CV7092. That Court has scheduled deadlines for briefing and scheduled an evidentiary hearing on December 10th with a backup date of December 11th in case the parties are in Federal Court on December 10th. The Milwaukee County Court has the authority to summarily hear and decide the matter. Wis. Stat. § 9.01(7)(b)

Regardless of the court's decision in this case, the challenge to the election in Milwaukee County Circuit Court Case 2020CV7092 will continue. That case can remedy any alleged wrongs committed during the 2020 General Election in Wisconsin. Should that occur, it would repair any harm suffered by plaintiff without needing any intervention from this court.

Plaintiff and Trump do have significant logistical and timing challenges in pursuing relief whether in this court or before the Milwaukee County Circuit Court. However, as it relates to the claims about the WEC guidance, that guidance has been in place since October 18th, 2016 and May 13, 2020, respectively. Plaintiff had ample opportunity to bring challenges with respect to that guidance prior to the election. Additionally, courts are and will continue to do everything they can to hear these cases in an expedited manner given the electoral voters are scheduled in vote in Wisconsin on December 14th, which is exactly 7 days from today.

Plaintiff fails to establish the balance of equities favors the plaintiff and goes against the public interest

The court must balance the equities when determining whether to grant a preliminary injunction. Everyone in Wisconsin, plaintiff, defendants, and amicus, desire a free and fair election. Based on that, the equities should be balanced in favor of a free and fair election.

With regards to this election, the statutorily mandated procedure for disputing an election should continue to proceed. The Wisconsin Legislature was aware that disputes could arise and in fact disputes have arisen in Wisconsin over the years. This is not the first case to challenge absentee ballots specifically for alleged noncompliance with the statutory provisions. See e.g., Sommerfeld v. Board of Canvassers, 269 Wis. 299, 69 N. W. (2d) 235. The public is served by allowing the statutory process to continue without interference from the Federal Courts.

Issuing the injunction requested by plaintiff would further moot the Wis. Stat. § 9.01 challenge occurring. If this court orders Governor Evers to certify that Trump won the State of Wisconsin, it would moot any outcome in the Wis. Stat. § 9.01 challenge occurring in Wisconsin by a State court. U.S. CONST. art. VI, § 2 ("Supremacy Clause"). In doing so, this court would be putting the insurmountable weight of the Federal Government on the election result in Wisconsin and would be unbalancing the scale created by system of checks and balances that have been maintained since the Constitution was adopted.

CONCLUSION

The plaintiff has failed to establish that this court should grant the requested injunction. Plaintiff has not sufficiently shown that this court has subject matter jurisdiction as there has not been a *substantial* departure from the legislative scheme for choosing electors. Additionally, even if this court has subject matter jurisdiction it should decline to issue the injunction in favor

of allowing the challenge filed pursuant to the legislative scheme to progress in Milwaukee County Circuit Court Case 2020CV7092 as required by Article II of the Constitution to continue. Wis. Stat. § 9.01(7)(b) allows that matter be "summarily heard and determined". To the extent an appeal is filed by either party, appellate courts can be expected to do everything in their power to rule in expedited manner given the upcoming electoral vote on December 14th.

The plaintiff meets none of the requirements for a preliminary injunction. The plaintiff has not shown evidence of fraud occurring in the 2020 Wisconsin General Election. At best plaintiff has shown statistical areas for concern and computer security concerns with some election software. However, absent from plaintiff's claims are any allegations that fraud occurred. Fed. R. Civ. P. 9(b) requires plaintiff's allegations "state with particularity the circumstances constituting fraud." There are no witnesses offered by plaintiff to any fraud or misconduct in Wisconsin. Plaintiff will not suffer any harm, let alone irreparable harm, from the court declining to issue this injunction. In absence of this court issuing an injunction, the allegations of fraud and election code violations will continue in Wisconsin Circuit Court; where such challenges belong pursuant to the legislative scheme enacted pursuant to Article II of the U.S. Constitution. The balancing of equities and public interest weigh against Federal intervention in a State election dispute. The Wisconsin Circuit Court should be given its opportunity to fulfill its obligation under Wis. Stat. § 9.01. The Wisconsin Circuit Court, not this court, should enter any necessary order to the board of canvassers to correct fraudulent or incorrect vote tallies.

For the reasons outlined in this brief, this court should deny plaintiff's motion for a temporary restraining order or preliminary injunction.

Case No.: 20CV1771

DEFENDANT GOVERNOR TONY EVERS'S
MOTION TO DISMISS PLAINTIFF'S AMENDED COMPLAINT

The reasons for dismissing Plaintiff's complaint, with prejudice, are numerous. Glaringly, not only does Plaintiff lack standing to bring his claims, but his claims are also not justiciable before this Court. Therefore, the Court lacks subject matter jurisdiction and the complaint should be dismissed pursuant to Fed. R. Civ. P. 12(b)(1). Moreover, Plaintiff's claims are barred by the Eleventh Amendment of the U.S. Constitution. And, given Plaintiff's delay in filing his complaint, even if Plaintiff had standing and his claims were both justiciable and not constitutionally foreclosed, they are now foreclosed under the doctrine of laches. Finally, even if Plaintiff surmounts these jurisdictional, justiciability, and equitable objections, Plaintiff's claims should also be dismissed pursuant to Fed. R. Civ. P. 9(b) and 12(b)(6) for failure to allege fraud with particularity and failure to state a claim upon which relief may be granted.

For all of these reasons, Defendant Governor Tony Evers moves this Court to dismiss Plaintiff's claims entirely and with prejudice without ever adjudicating Plaintiff's motion for injunctive relief.

This motion to dismiss must be heard before any motion for relief in this matter. Although styled as temporary or preliminary relief, Plaintiff's requested relief, namely overturning the results of Wisconsin's November 2020 presidential election, is effectively permanent. Moreover, Plaintiff's recent request for an evidentiary hearing makes clear that what he seeks—without any discovery or basic adversarial development of evidence—is a trial and final adjudication on the merits. Accordingly, Fed. R. Civ. P. 12(i) requires the Court to hear and decide this motion before reaching Plaintiff's request for injunctive relief.

The grounds for this motion are fully set forth in the accompanying brief.

TABLE OF CONTENTS

INTRODUCTION

Wisconsin held its general election on November 3 after months of careful preparation and public announcement of election procedures. Since then, the votes have been counted, audited, and many were counted again. The results are now tallied and certified. The candidate who received the most votes for the office of President of the United States is Vice President Joe Biden.

Plaintiff was a nominee to be an electoral college elector for candidate President Donald Trump. He now, for the first time, alleges that the long-planned election procedures were unlawful and that the outcome is additionally tainted by a conspiracy dating back to the administration of Venezuelan president Hugo Chavez. He offers no direct evidence that even a single vote was miscounted in Wisconsin, and instead relies on conspiracy theories based on anonymous sources and inadmissible evidence. His claims are entirely meritless.

On this basis, he asks for disenfranchisement of hundreds of thousands Wisconsin voters and "an order instructing the Defendants to certify the results of the General Election for Office of the President in favor of President Donald Trump" in a preliminary ruling. (Dkt. 9 ¶ 139.) This unprecedented relief is unlawful, would take the election out of the hands of Wisconsin voters, and is fundamentally undemocratic. This Court should not reverse the outcome of the carefully planned and reliably executed Wisconsin election.

STATEMENT OF THE CASE

The November 2020 Wisconsin election was secure and reliable. Nearly 3.3 million Wisconsin voters cast ballots for the office of President of the United States.[1] Those votes have been counted, audited, and many have even been re-counted. There is *zero* indication of any fraud, or anything else that would call into question the reliability of the election results. To the contrary, every indication is that the outcome is correct.

A statewide audit of electronic voting machines used in the November election found no systematic problems.[2] To conduct this audit, the Commission randomly selected 5% of all reporting units statewide—a sample that included at least one piece of voting equipment in each of Wisconsin's 72 counties and each kind of voting equipment. It included 28 voting Dominion machines. (WEC Audit Memo 4.) The audit then hand-counted 4.2% of all ballots, more than 140,000, and the hand-counted results were compared to the results tabulated by each kind of voting machine. (WEC Audit Memo 2.) Members of the public could attend the audit. (WEC Procedures Memo 2.)

That audit did not "identif[y] any issues with the tabulation functionality of the voting equipment nor did [it] uncover any programing issues with the machines

[1] Wisconsin Elections Commission, *WEC Canvass Reporting System*, Canvas Results for 2020 General Election 11/3/2020 6:00:00 AM https://elections.wi.gov/sites/elections.wi.gov/files/Statewide%20Results%20All%20Offices%20%28pre-Presidential%20recount%29.pdf (Nov. 18, 2020).

[2] The Commission's Audit Memo is publicly available at https://elections.wi.gov/sites/elections.wi.gov/files/2020-12/2020%20Audit%20Program%20Update%20for%2012_1_2020%20Meeting%20FINAL.pdf

on which results were audited." (WEC Audit Memo 4.) Instead, it showed that "the tabulation voting equipment"—including the challenged Dominion voting machines— "performed up to certification standards and accurately recorded and tabulated votes." (WEC Audit Memo 5.) Although some "minor discrepancies" were uncovered, the "vast majority . . . were due to human error . . . and only impacted one or two votes . . . and were not indicative of equipment malfunction or failure." (WEC Audit Memo 5.) The Commission concluded that "the results of the audit did not identify any programming errors that impacted how the voting equipment subject to audit counted votes . . . . This expanded audit and random selection process effectively confirmed the accuracy of voting equipment used in Wisconsin at the election." (WEC Audit Memo 8.)

Additionally, a recount confirmed that there were no errors in two major counties. President Donald Trump requested a recount of ballots cast in Dane and Milwaukee counties. That recount did not materially change the vote tallies for either President Trump or Vice President Biden.[3] More to the point, nothing uncovered during the recount pointed to widespread fraud through hacked or otherwise manipulated voting machines. President Trump, to be sure, identified various categories of ballots that he contends were cast illegally, but he did not identify any vote tallies maliciously altered.

[3] 2020 General Election Recount, https://elections.wi.gov/sites/elections.wi.gov/files/2020-11/2020%20General%20Election%20Recount%2011-30-20%20final.xlsx (Nov. 30, 2020).

Moreover, the wild accusations of election unreliability, such as those in the Plaintiff's complaint, led federal agencies to investigate. That investigation revealed nothing to substantiate the allegations. U.S. Attorney General William Barr even specifically commented on the types of claims being made in this case, concluding:

> There's been one assertion that would be systemic fraud and that would be the claim that machines were programmed essentially to skew the election results. And the DHS and DOJ have looked into that, and so far, we haven't seen anything to substantiate that.[4]

These accusations were also denounced by Dominion itself, when it issued a public statement specifically addressing the claims brought by Plaintiff's counsel and further demonstrating the frivolity of these claims.[5]

From the initial canvassing, through the audit, recount, and federal investigation, there is no credible allegation of any material election irregularity. This Court, and the public, can be confident that votes were correctly recorded and counted.

ARGUMENT

I. Plaintiff has the burden to demonstrate that the Court should overturn the audited election results.

Plaintiff characterizes his request as preliminary, though the reality is that this Court's initial determination is likely to be effectively final for challenging

---

[4] Balsamo, Michael, *Disrupting Trump, Barr says no widespread election fraud*, AP News, https://apnews.com/article/barr-no-widespread-election-fraud-b1f1488796c9a98c4b1a9061a6c7f49d (Dec. 1, 2020).

[5] Dominion's statement is available online. Dominion Voting, *Statement From Dominion on Sidney Powell's Charges* (Nov. 26, 2020), https://www.dominionvoting.com/dominion-statement-on-sidney-powell-charges/.

Wisconsin's presidential vote before inauguration. The type of immediate relief he seeks is already a drastic remedy and is never awarded as a matter of right. *Munaf v. Geren*, 553 U.S. 674, 689–90 (2008). The timing reality here makes his request especially extraordinary.

Plaintiff carries the burden for his request. A preliminary injunction "may only be awarded upon a clear showing that the plaintiff is entitled to such relief." *Winter v. Nat'l. Res. Def. Council, Inc.*, 555 U.S. 7, 22 (2008); *see also Goodman v. Ill. Dep't of Fin. & Prof'l Regulation*, 430 F.3d 432, 437 (7th Cir. 2005) "A plaintiff seeking a preliminary injunction must establish [1] that he is likely to succeed on the merits, [2] that he is likely to suffer irreparable harm in the absence of preliminary relief, [3] that the balance of equities tips in his favor, and [4] that an injunction is in the public interest." *Illinois Republican Party v. Pritzker*, 973 F.3d 760, 762 (7th Cir. 2020) (quoting *Winter*, 555 U.S. at 20).

II. Plaintiff has failed to demonstrate that he is likely to succeed on the merits of his claims.

Plaintiff has no likelihood of success on the merits. This case has multiple threshold defects that would require dismissal. Plaintiff lacks standing, his inexplicably late claim is barred by laches, and the relief he requests is barred by the Eleventh Amendment and Substantive Due Process Clause.

Turning to the individual causes of action, he has stated no constitutional claim as a matter of law. The Elections and Electors Clauses do not create federal claims for alleged vote-counting disputes and violations of state election law of the kind alleged here do not amount to federal equal protection or due process claims.

Even if Plaintiff had a claim, his purported evidence is shockingly unreliable, is unlikely to even meet basic evidentiary standards, and cannot possibly support overturning the results of the election. Finally, the relief he seeks is nothing short of mass disenfranchisement.

A. This case has fatal jurisdictional and procedural defects that would require dismissal.

1. Plaintiff lacks Article III standing to assert any of his claims.

Plaintiff is a registered voter and nominee to be a presidential elector for the Republican Party. (Dkt. 9 ¶ 24.) Neither his status as a registered voter nor an elector nominee establishes standing.

Plaintiff states that he is registered to vote in Wisconsin but does not even allege that he actually voted in the November 2020 election. (Dkt. 9 ¶ 24.) He cannot claim any injury by being simply registered. Even if he had voted, it is well established a voter cannot allege the particularized harm necessary to bring a claim based on alleged defects in other votes. This is so because the harm Plaintiff alleges to have suffered would, if proven, be experienced equally by all voters in the state. *Martel v. Condos*, No. 20-cv-131, 2020 WL 5755289, at *4 (D. Vt. 2020) ("If every voter suffers the same incremental dilution of the franchise caused by some third-party's fraudulent vote, then these voters have experienced a generalized injury."); *see also Moore v. Circosta*, No. 20CV911, 2020 WL 6063332 at *14 (M.D.N.C. 2020); *Donald J. Trump for Pres., Inc. v. Cegavske*, No. 20-cv-1445 JCM, 2020 WL 5626974, at *4–5 (D. Nev. 2020); *Paher v. Cegavske*, 457 F. Supp. 3d 919, 926 (D. Nev. 2020).

Plaintiff's status as a presidential elector likewise does not grant him standing. He cites *Carson v. Simon*, 978 F.3d 1051 (8th Cir. 2020), for the proposition, never recognized in the Seventh Circuit, that elector status grants one standing to challenge election results. But the dissent in *Carson* persuasively explained why it does not:

> Electors are not candidates for public office as that term is commonly understood. Whether they ultimately assume the office of elector depends entirely on the outcome of the state popular vote for president . . . . They are not presented to and chosen by the voting public for their office, but instead automatically assume that office based on the public's selection of entirely different individuals.

Id. at 1063 (Kelly, J., dissenting). Electors therefore do not have a "particularized stake" in the election outcome beyond that of ordinary voters. *Id.* The Third Circuit rejected a similar standing argument, holding instead that a congressional candidate lacked Article III standing to assert nearly-identical claims to the ones Plaintiff pursues here, showing that *Carson* is an outlier. *See Bognet v. Sec'y Commonwealth of Pennsylvania*, No. 20-3214, 2020 WL 6686120, at *8 n.6 (3d. Cir. 2020). And just today, the Eastern District of Michigan rejected an identical claim. *King v. Whitmer,* No. 20-13134 (E.D. MI. December 7, 2020) (explaining that the court is unconvinced regarding elector-nominee standing). Plaintiff's elector status grants him no special standing privileges. Even if the Plaintiff had standing for some claims, he particularly lacks standing for any claim that violations of state elections law amount to a federal claim under the Electors Clause. For Electors Clause claims, even candidate-plaintiffs fare no better in the standing inquiry than other citizens. *See, e.g., Bognet*, 2020 WL 6686120 at *8. This is because every candidate, just like every other citizen, is in precisely the same position. *See id.* If an Electors Clause claim belongs to anyone,

it belongs "only to the [legislature]." *Id.* at *7. Here, for claimants like Plaintiff who are not the legislature, and bear not even a "conceivable relationship to state lawmaking processes, they lack standing to sue over the alleged usurpation of the [legislature's] rights under the . . . Electors Clause[ ]." *Id.* at *7.

2. Laches bars Plaintiff's unreasonably late allegations.

Plaintiff inexplicitly waited until after the Wisconsin election, after the canvassing, after the recount, after the audit, after results were certified, and indeed until the eve of the electoral college vote, to bring his claim of state law violations and widespread fraud that allegedly originated years ago in the era of Hugo Chavez's Venezuelan presidency. If the doctrine of laches means anything, it is that Plaintiff here cannot overturn the results of a completed and certified election through preliminary relief in this late-filed case.

"Laches arises when an unwarranted delay in bringing a suit or otherwise pressing a claim produces prejudice." *Jones v. Markiewicz-Qualkinbush*, 842 F.3d 1053, 1060 (7th Cir. 2016) (citation omitted). "The obligation to seek injunctive relief in a timely manner in the election context is hardly a new concept." *Id.* at 1060–61. "In the context of elections, . . . any claim against a state electoral procedure must be expressed expeditiously." *Fulani v. Hogsett*, 917 F.2d 1028, 1031 (7th Cir. 1990). Plaintiff's tardy claims meets every element laches.

Plaintiff waited to challenge widely-known procedures until after millions of voters cast their ballots in reliance on those procedures. That delay is unreasonable under both the law and common sense and this case should be dismissed *See Wood v.*

Raffensperger, No. 20-14418, 2020 WL 7094866, at *6 (11th Cir. Dec. 5, 2020) (Dismissing a case as moot where Plaintiff challenged vote certification after the election and after results were certified.); (*King,* No. 20-13134 Dkt. 62:19 ("Plaintiffs could have lodged their constitutional challenges much sooner than they did, and certainly not three weeks after Election Day and one week after certification of almost three million votes. The Court concludes that Plaintiffs' delay results in their claims being barred by laches").)

Just for example, on the issue of "indefinitely confined" voters, the legal issues were litigated in state court almost *eight months* ago. *See* Pet. for Original Action, date March 27, 2020, Supreme Court of Wisconsin, No. 2020AP000557-OA. Plaintiff obviously could have pressed this indefinite confinement issue in the many months between when it emerged and the November general election, thus allowing Wisconsin election officials to adjust accordingly.

The prejudice caused by Plaintiff's delay is profound. Plaintiff sat on his claims allowing millions of Wisconsinites to vote in reliance on those procedures, only to attack those decisions after they became irreversible. *See Fulani*, 917 F.2d at 1031 ("As time passes, the state's interest in proceeding with the election increases in importance as . . . irrevocable decisions are made."). This is precisely the type of prejudice the laches doctrine exists to prevent.

Nothing less than the right of every Wisconsinite to have their vote for President counted is at stake if Plaintiff's requests are granted. Indeed, as the U.S. Supreme Court explains, "[c]onfidence in the integrity of our electoral processes is

essential to the functioning of our participatory democracy." *Purcell v. Gonzalez*, 549 U.S. 1, 4 (2006). One could not shake the public's confidence in our electoral process more vigorously than by allowing unforeseeable post-election legal challenges to invalidate hundreds of thousands of votes that were cast in reliance on election officials' guidance.

3. The Eleventh Amendment precludes Plaintiff's claims seeking this Court to order state officials to comply with state election law.

Plaintiff fundamentally asks this court for a declaration and injunction against state officials for alleged violations of state election law that he describes as "Violations of Wisconsin Election Code." (Dkt. 9:11.) Such a claim is barred by the Eleventh Amendment.

The Eleventh Amendment bars "relief against state officials on the basis of state law, whether prospective or retroactive." *Pennhurst State School & Hospital v. Halderman*, 465 U.S. 89, 106 (1984). The Supreme Court has explained that "it is difficult to think of a greater intrusion on state sovereignty than when a federal court instructs state officials on how to conform their conduct to state law. Such a result conflicts directly with the principles of federalism that underlie the Eleventh Amendment." *Id.*; *see also Rose v. Bd. of Election Comm'rs for City of Chi.*, 815 F.3d 372, 375 n.2 (7th Cir. 2016) ("[A]ny argument to the effect that the state did not follow its own laws is barred by the Eleventh Amendment.").

Plaintiff's federal constitutional claims turn almost entirely on his allegations about state election officials improperly administering state election law. His

Elections and Electors Clause claim turns on "three separate instances where Defendants violated the Wisconsin Election Code," (Dkt. 9 ¶¶ 104–06), just as his Equal Protection Clause claim rests on how "Defendants failed to comply with the requirements of the Wisconsin Election Code" (Dkt. 9 ¶ 116) and his due process claim relies on "Defendants['] violation of the Wisconsin Election Code" (Dkt. 9 ¶ 129). Just as in the parallel case from Michigan decided today, "the Eleventh Amendment bars Plaintiffs' claims against Defendants". (*King,* No. 20-13134, Dkt. 62:13.) Plaintiff fundamentally asks this Court to order state officials to follow state election law, relief that the Eleventh Amendment and *Pennhurst* squarely bars.

B. Plaintiff fails to state any valid federal claim.

1. Plaintiff fails to plead a claim under either the Election or Electors clauses.

In Count I of the Amended Complaint, Plaintiff alleges violations of the federal Constitution's Elections and Electors Clauses which vest authority in "the Legislature" of each state to regulate "[t]he Times, Places, and Manner of holding Elections for Senators and Representatives", U.S. Const. art. I, § 4, cl. 1., and to direct the selection of presidential electors, U.S. Const. art. II, § 1, cl. 2, respectively. The cause of action rests entirely on allegations that three aspects of administrative guidance issued by the Commission were contrary to state election law. (Dkt. 9 ¶¶ 104–106.) Those claims fail as a matter of law because his disagreement with how state officials administered state elections law does not state a violation of the Elections and Electors Clause.

It is black-letter law that "'[a] violation of state law does not state a claim under § 1983,' and, more specifically, 'a deliberate violation of state election laws by state election officials does not transgress against the Constitution.'" *Shipley v. Chi. Bd. of Election Commissioners*, 947 F.3d 1056, 1062 (7th Cir. 2020) (citation omitted); *see also Bognet*, 2020 WL 6686120, *6 ("[F]ederal courts are not venues for plaintiffs to assert a bare right 'to have the Government act in accordance with law.'") (citation omitted); *Martinez v. Colon*, 54 F.3d 980, 989 (1st Cir. 1995) ("[T]he Constitution is not an empty ledger awaiting the entry of an aggrieved litigant's recitation of alleged state law violations—no matter how egregious those violations may appear within the local legal framework.").

This non-interference principle rests on a "caution against excessive entanglement of federal courts in state election matters":

> The very nature of the federal union contemplates separate functions for the states. If every state election irregularity were considered a federal constitutional deprivation, federal courts would adjudicate every state election dispute, and the elaborate state election contest procedures, designed to assure speedy and orderly disposition of the multitudinous questions that may arise in the electoral process, would be superseded by a section 1983 gloss.

Bodine v. Elkhart Cty. Election Bd., 788 F.2d 1270, 1272 (7th Cir. 1986).

Plaintiff's theory here violates this core federalism principle, as it rests solely on three aspects of administrative guidance issued by the Commission. (Dkt. 9 ¶¶ 104–106.) None of these alleged state law violations can support a federal constitutional claim under cases like *Shipley* and *Bodine*. The general rule that "[a] violation of state law does not state a claim under § 1983," *Shipley*, 947 F.3d at 1062,

would no longer have any teeth, and plaintiffs could evade it simply by alleging an Elections Clause violation. This would threaten to replace Wisconsin's "elaborate state election contest procedures" with federal court intervention in the "multitudinous questions that may arise in the electoral process," just as *Bodine* warned against. 788 F.2d at 1272 (citation omitted); (*see also King,* No. 20-13134, Dkt. 62:29–30 (holding in a nearly identical case that "Plaintiffs lack standing to sue under the Elections and Electors Clause").) Indeed, this collision between federal and state proceedings can be seen playing out here and now. This week, President Trump is litigating his challenge to Wisconsin's recount results through the state procedures under Wis. Stat. § 9.01. *Donald J. Trump v. Joseph R. Biden*, No. 20CV7092 (Wis. Cir. Ct. Milwaukee Cty.); *Donald J. Trump v. Joseph R. Biden*, No. 20CV2514 (Wis. Cir. Ct. Dane Cty.) (consolidated with Milwaukee County case No. 20CV007092.). Simultaneously, Plaintiff here is challenging the count in this Court. It would be hard to better illustrate the federalism concerns raised by opening the federal courthouse doors to Plaintiff's state election law grievances.

2. Plaintiff fails to state a claim for equal protection and due process because he asserts ordinary election irregularities that should be handled under state law.

In counts II and III, Plaintiff alleges constitutional equal protection and due process claims. But he states no constitutional claim; he merely makes state-law claims that are fully addressable through state procedures.

The federal "Constitution is not an election fraud statute." *Bodine*, 788 F.2d at 1271. "It is not every election irregularity . . . which will give rise to a constitutional

claim." *Id.* The federal constitution "is implicated only when there is 'willful conduct which undermines the organic processes by which candidates are elected.'" *Id.* at 1272 (emphasis omitted) (citation omitted). Therefore, "garden variety election irregularities that could have been adequately dealt with through the procedures set forth in [state] law" do not support constitutional due process claims. *Id.*; *see also Bennett v. Yoshina*, 140 F.3d 1218, 1226 (9th Cir. 1998) ("[G]arden variety election irregularities do not violate the Due Process Clause, even if they control the outcome of the vote or election.").

Plaintiff relies on a vote-dilution theory. (Dkt. 9 ¶¶ 114, 125–26.) This theory fails in its premise because he does not allege that he voted. (Dkt. 9 ¶ 24.) With no vote, there is nothing to dilute, and his voter-dilution claim fails in its premise.

Additionally, Plaintiffs' novel version of vote dilution could not support a federal claim, even if he had voted. Recognized vote dilution claims involve state laws that structurally disadvantage certain groups in the voting process. For instance, *Reynolds v. Sims*, 377 U.S. 533 (1964), held that state legislative districts must be apportioned by population to avoid diluting the votes of residents in disproportionately populous districts. Other vote dilution claims similarly target legislative apportionment schemes that disadvantage minorities in violation of either equal protection or the Voting Rights Act of 1965 ("VRA"). *See, e.g.*, *Thornburg v. Gingles*, 478 U.S. 30, 34 (1986) (multimember districts in North Carolina violated VRA by diluting black vote); *Miller v. Johnson*, 515 U.S. 900, 911 (1995) ("[A] vote dilution claim alleges that the State has enacted a particular voting scheme as a

purposeful device '[t]o minimize or cancel out the voting potential of racial or ethnic minorities.'" (citation omitted)).)

Plaintiff's novel vote dilution theory, in contrast, rests on alleged vote counting violations and does not fit within this recognized malapportionment framework, as the Third Circuit held just days ago in *Bognet*, 2020 WL 6686210, at *11. There, individual voters alleged that votes arriving or cast after election day were unlawfully counted, thereby diluting the plaintiffs' votes in an unconstitutional manner. *Id.* at *9. The Third Circuit rejected this theory, explaining that "[c]ontrary to [this] conceptualization, vote dilution under the Equal Protection Clause is concerned with votes being weighed differently." *Id.* Recognizing this unprecedented kind of dilution claim would upset the delicate balance between state and federal authority over elections:

> [I]f dilution of lawfully cast ballots by the "unlawful" counting of invalidly cast ballots "were a true equal-protection problem, then it would transform every violation of state election law (and, actually, every violation of every law) into a potential federal equal-protection claim requiring scrutiny of the government's 'interest' in failing to do more to stop the illegal activity."

Bognet, 2020 WL 6686210, at *11 (citation omitted).

Plaintiffs' novel vote dilution claim would implicate practically *any* state election, because "[i]n just about every election, votes are counted, or discounted, when the state election code says they should not be. But the Constitution 'd[oes] not authorize federal courts to be state election monitors.'" *Donald J. Trump for President, Inc. v. Boockvar*, No. 20-cv-966, 2020 WL 5997680, at *48 (Oct. 10, 2020) (second alteration in original) (citing *Gamza v. Aguirre*, 619 F.2d 449, 454 (5th Cir.

1980)). Yet state election monitors is exactly what federal courts would become, if unlawfully cast votes alone sufficed to state a constitutional claim.[6]

Plaintiff does not cite a single vote dilution case resting on allegedly illegal votes. Instead, Plaintiff relies primarily on *Reynolds*—again, a case about dilution caused by malapportionment. 377 U.S. at 555 (Dkt. 9 ¶ 114.). But *Reynolds* relied on cases involving whether Congress had the power to criminalize certain state election misconduct under federal law. *See Ex parte Siebold*, 100 U.S. 371 (1879), and *United States v. Saylor*, 322 U.S. 385 (1944). As the Third Circuit recognized, *Reynolds*' citation to those two criminal cases does not mean that individual voters may assert civil vote dilution claims based solely on illegal votes. *See Bognet*, 2020 WL 6686120, at *14. Plaintiff also cites *Donald J. Trump for President, Inc. v. Bullock*, No. CV 20-66-H-DLC, 2020 WL 5810556 (Sept. 2020), but that case merely "assum[ed] such a claim exists" only to dismiss it based on a lack of evidence.

Rejecting Plaintiff's "illegal vote" dilution theory would not leave the integrity of Wisconsin's elections without safeguards. A wide range of regulations govern voter

[6] Many other federal courts have rejected these kinds of vote dilution claims. *See also, e.g.*, *Republican Party of Pennsylvania v. Cortes*, 218 F. Supp. 3d 396, 407 (E.D. Pa. 2016) ("[V]ote dilution cases do not extend to "speculation that fraudulent voters may be casting ballots elsewhere."); *Donald J. Trump for President, Inc. v. Boockvar*, No. 2:20-CV-966, 2020 WL 5997680, at *59 (W.D. Pa. Oct. 10, 2020) (rejecting vote dilution claim resting on potential fraud that did not involve "malapportionment, disenfranchisement, or intentional discrimination"); *Minnesota Voters All. v. Ritchie*, 720 F.3d 1029, 1033 (8th Cir. 2013) (rejecting vote dilution claim resting on "illegally cast votes" by election day registrants, absent allegations of "discriminatory or other intentional, unlawful misconduct" by election officials or "willful and illegal conduct [by] election officials [that] results in fraudulently obtained or fundamentally unfair voting results").

registration and absentee voting to ensure that only eligible residents receive and cast absentee ballots. *See generally* Wis. Stat. ch. 6. If those regulations are purposely evaded, state election fraud prosecutions may ensue. *See generally* Wis. Stat. § 12.13. And recounts are the ultimate backstop, where votes may be identified, challenged, and, if appropriate, invalidated. *See generally* Wis. Stat. § 9.01. The crucial point is that our system of federalism entrusts electoral integrity to these state-level protections, not to federal constitutional claims by individual voters. Plaintiff's vote dilution claim rests on a fatally flawed legal theory and fails as a matter of law.

3. Plaintiff's purported evidence is unpersuasive, unlikely to meet basic evidentiary standards, and does not support discarding the votes of millions of Wisconsin residents.

Count IV of the Amended Complaint alleges massive election fraud through an "insidious, and egregious ploy" to falsely report the outcome of the 2020 Wisconsin general election. (Dkt. 9 ¶¶ 2, 132–135.) The general theory is that foreign oligarchs and dictators created a voting system called "Smartmatic" to help Hugo Chavez in Venezuelan elections. (Dkt. 9 ¶¶ 7–8; 9-1 ¶¶ 13–20.) There is no allegation that Smartmatic is used in Wisconsin. Instead, an anonymous declarant says that "software of Dominion and other election tabulating companies relies upon software that is a descendant of . . . Smartmatic" and Plaintiffs allege that "Dominion Systems derive from the software designed by Smartmatic Corporation." (Dkt. 9 ¶ 7; 9-1 ¶ 21.)

Plaintiff then makes the incredible, and implausible, leap that Dominion machines in Wisconsin were hacked in 2020. He asks the court to overturn the

election results because anonymous declarants say that a different system, used in a different country, for a different election, was manipulated. This would not even pass Rule 9(b) pleadings standards, let alone support the unprecedented and extraordinary act of having a federal court reverse the outcome of a certified state election.

Things get even worse looking past the pleadings to the supporting documents. Even a facial review shows a complete lack of reliable evidence. Much of Plaintiff's purported evidence comes from undisclosed witnesses or is completely irrelevant to Wisconsin. What little even mentions Wisconsin is based on plainly unreliable data and reasoning. His purported evidence does not meet admissibility standards and is not in the ballpark of supporting his extraordinary request.

Of Plaintiff's 18 proffers of evidence, five are from anonymous declarants where the names of the witness or expert are redacted. (Dkt. 9-1; 9-4; 9-12; 9-13; 9-19.) This makes it impossible to evaluate the legitimacy or potential bias of the evidence and those declarations should be disregarded. Even hypothetically looking past the secret sources, the affidavits are astoundingly thin. Exhibit 1 propounds at length about the integrity of past elections in Venezuela but offers no information about the 2020 Wisconsin election. Exhibit 12 is from a self-proclaimed "white-hat hacker" who testifies to the unremarkable fact that Dominion's public website has internet interrelationships in other countries, but makes absolutely no connection to Wisconsin voting machines or data security. (Dkt. 9-12:1.) Exhibit 13 is from an anonymous source who purports to be an "amateur network tracer and typographer"

whose third-hand amateur opinions about corporate relationships amount to a conspiracy theory. (Dkt. 9-13:1.)

The documents include two anonymous expert reports. (Dkt. 9-4; 9-19.) Exhibit 4 offers a terse statistical analysis culminating in a graphic where the author identifies "large red dots" on a vote ratio chart where Biden overperformed predictions in counties using Dominion voting machines. (Dkt. 9-4:2–3.) It is difficult to discern what, if anything, the scatter plot shows, and the report notably leaves unexplained that nearly all of the graph's "large dot" indicators, red and blue, show overperformance, which is more consistent with the conclusion that more voters turned out and Biden overperformed everywhere, which is why he won the election. That one candidate received more than expected votes at a particular voting machine is entirely unremarkable in an election with high turnout where that candidate won. And anonymous expert report Exhibit 19 leads its analysis with the unhelpful statement that "it is possible to obtain rough estimates on how vote fraud could possibly have effected [sic] the election." (Dkt. 9-19:2.) As if that were not speculative enough, the report indicates that its Wisconsin "data was obtained from the twitter account of @shylockh, who derived his sources from the New York Times and in some cases from the unofficial precinct reports." (Dkt. 9-19:8–9.) Such anonymous, bare speculation on third- or fourth-hand information is unpersuasive.

Of the documents that are at least authored, many have nothing to do with the Wisconsin election. (Dkt. 9-6; 9-7; 9-8; 9-10; 9-11; 9-14; 9-15; 9-16; 9-18.) For example, Exhibit 6 is a statement from a Colorado resident who reports going to an Antifa

meeting and overhearing a conversation where he believes he heard a person named "Eric" state that he is making sure Trump does not win the election. (Dkt. 9-6:2.) Through a series of Google searches and listeners of his podcast, he opines that a former employee of Dominion named Eric has altered the election. (Dkt. 9-6:2–6.) This Googled evidence, based on hearsay at an alleged meeting in Colorado, is not reliable evidence of election fraud in Wisconsin.

Exhibit 7 is from a person who observed polls in Atlanta, Georgia, in June and August of 2020 and does not even mention Wisconsin. Exhibit 8 opines on the political status of Venezuela. Exhibit 14 is from a person who reports that he has reviewed materials about Dominion voting systems, all from public websites, but offers no information about Wisconsin election processes. And Exhibits 10, 11, 15, 16 and 18 are generalized articles or letters about election systems generally that do nothing to prove Plaintiff's claims that vote tabulating in Wisconsin is inaccurate.

The very few non-anonymous filings that even discuss the Wisconsin election are facially unpersuasive and likely do not even meet evidentiary reliability standards. Expert testimony is inadmissible unless it: will help the trier of fact to understand the evidence; is based on sufficient facts or data; is the product of reliable principles and methods; and the expert has reliably applied the principles and methods to the facts of the case. Fed. R. Evid. 702. In assessing the admissibility of expert testimony, courts must ensure that the testimony is both reliable and relevant. *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, 509 U.S. 579, 597 (1993). District courts "must evaluate: (1) the proffered expert's qualifications; (2) the reliability of

the expert's methodology; and (3) the relevance of the expert's testimony." *Gopalratnam v. Hewlett-Packard Co.*, 877 F.3d 771, 779 (7th Cir. 2017). The party offering the expert testimony has the burden of establishing that the proffered testimony satisfies Fed. R. Evid. 702. *Id.* at 782.

Plaintiff offers four expert opinions in support of his request to overturn the Presidential election. (Dkt. 9-2; 9-3; 9-9; 9-17.) None meet the standard in Rule 702.

One is a re-filing of a report that was previously filed in a state court case, from Matthew Braynard. (Dkt. 9-3.) Braynard does not appear to be qualified to offer the opinions in his report. He offers statistical conclusions based on a purported sampling of voters in certain categories, which he opines are representative of various larger categories of voters. Braynard has no formal education in statistics or statistical surveys. Instead, his report indicates he has a degree in business administration. (Dkt. 9-3:3.) It is dubious whether Braynard's opinions are based on "sufficient facts and data" or whether his methods are reliable. Braynard says he used voter information provided by "L2 Political" (Dkt. 9-3:3), but it is unknown whether this data reliably reflects information on Wisconsin voters. He also purports to rely on a database of address changes, but it is unclear whether this database accurately reflects electors' correct addresses for voting purposes. Further, his conclusions are based on the results of telephone calls made by call centers and "social media researchers" that are of unknown quality. (Dkt. 9-3:3.) These telephone surveys could easily include bad data and unreliable methods, given that the report does not disclose exactly how these surveys were conducted. Plaintiff has not shown that

phone surveys like these can reliably obtain information about voters or that his limited sample of voters who responded is representative of the whole.

Next is the report of William Briggs, which exclusively used the flawed data from Braynard. (Dkt. 9-2:1.) Even apart from this flawed underlying data, Briggs's analyses are woeful. He concludes that thousands of people received absentee ballots who did not request one. (Dkt. 9-2:1.) His report fails to account for voters who have requested that absentee ballots be sent automatically for every election, which would fully explain his concern. Even setting aside whether that is even an indicia of fraud, one would assume that to reach this conclusion he identified people who received a ballot without requesting one. Not so. His report explains that he used phone survey results that asked, for example, whether a person requested an absentee ballot. (Dkt. 9-2:5.) His report indicates that only 433 people, out of the millions of Wisconsin voters, completed the survey. (Dkt. 9-2:5.) He assumes that this tiny sample was representative of the whole state and scaled the number up to predict the total number of people who requested ballots, and compared that to the number of people receiving ballots. (Dkt. 9-2:1.) What he did not do is the obvious analysis of asking anyone whether they received a ballot without asking for one. As he concedes in his report: "Survey respondents were not asked if they received an unrequested ballot . . . This is clearly a lively [sic] possibility . . . no estimates or likelihood can be calculated for this potential error due to absence of data." (Dkt. 9-2:2.) This type of methodology failure pervades his report.

The final two are the Keshel and Ramshland Jr. opinions, which are likewise unpersuasive. (Dkt. 9:9, 17.) Keshel is a data analysist with no apparent elections training but who reports that he has "political involvement requiring knowledge of election trends and voting behavior." (Dkt. 9-9:1.) He used uncertified information from an "unofficial tracker" to determine that the 2020 elections went "against the trends of the previous election" to elect a Democratic candidate. (Dkt. 9-9:1, 4.) But this is no more than acknowledging that a Republican won in 2016 and a Democrat won in 2020. Keshel refers to this as "suspicious vote totals" but it does not show any more than a different outcome in 2020 than in the past.

Ramshland Jr. does not disclose his data source other than "[m]y colleague and I . . . have studied the information that was publicly available." (Dkt. 9-17:4.) From this, he identifies "red flags" including a very high turnout in several Wisconsin counties. (Dkt. 9-17:9.) He concludes that fraud occurred because many votes for Biden were counted late in the tabulating process. (Dkt. 9-17:4–5.) But, as now been repeatedly publicly explained, this occurred because absentee ballots, which favored Democratic candidates, were counted together late in the election day. The report also "normalized" the turnout to a lower rate and found that "the excess votes are at least 384,085 over the maximum that could be expected. (Dkt. 9-17:9.) But this "normalization" is nothing more than lowering the vote count. He concludes on this analysis that there were up to 384,085 "illegal votes that must be disregarded." (Dkt. 9-17:12.) The idea that Wisconsin should discard votes because more people voted than normal is absurd.

This unpersuasive and unreliable evidence stands in contrast to an actual hand-count audit of the machines used in the election, which showed no fraud. Like in the parallel Michigan case, "With nothing but speculation and conjecture that votes for President Trump were destroyed, discarded or switched to votes for Vice President Biden, Plaintiffs' equal protection claim fails." (*King,* No. 20-13134, Dkt. 62:29–30.) This Court should not conclude, on Plaintiff's proffer of anonymous declarations, hearsay, and facially faulty analyses, that Wisconsin should disregard the outcome of the election for President.[7]

C. Plaintiff's requested remedy would unconstitutionally disenfranchise Wisconsin voters.

Regardless of all of the other reasons Plaintiff's claims fail, the remedy he seeks—the exclusion of hundreds of thousands of votes in Wisconsin—would violate these voter's federal due process rights by retroactively overriding election procedures that those voters relied on and nullifying votes cast for Vice President Biden based on a speculative and far-fetched conspiracy theory of voter fraud.

Once a state legislature has directed that the state's electors are to be appointed by popular election, the people's "right to vote as the legislature has prescribed is fundamental." *Bush v. Gore*, 531 U.S. 98, 104 (2000) (per curiam). That fundamental right to vote includes "the right of qualified voters within a state to cast

[7] Plaintiff's request for the Court to "seize and impound" all equipment statewide, is also misdirected. (Dkt. 9 ¶ 48.) The Commission does not own or have custody over such election equipment. *See* Wis. Stat. 5.91; Wis. Admin. Code ch. EL 7; https://elections.wi.gov/elections-voting/security (explaining that municipalities purchase the equipment.)

their ballots and have them counted." *United States v. Classic*, 313 U.S. 299, 315 (1941).

Due process is violated when voters rely on an established election procedure and significant disenfranchisement results from a change in the procedures post-election. *Bennett*, 140 F.3d at 1227*; Northeast Ohio Coal. for the Homeless v. Husted*, 837 F.3d 612 (6th Cir. 2016) (finding no reason to invalidate a ballot when there was no evidence of voter fraud.); *Griffin v. Burns*, 570 F.2d 1065, 1079 (1st Cir. 1978) (retroactive invalidation of absentee ballots violated due process). Those conditions would be squarely met here by Plaintiff's requested relief.

Wisconsin voters who reasonably relied on the established voting procedures would be disenfranchised by the thousands, raising serious concerns of a due process violation. To throw out the votes of 181,440 Wisconsin voters based on an implausible conspiracy regarding voting machine would violate the constitutional rights of these voters.

III. Plaintiff has failed to show that he will suffer irreparable harm without a preliminary injunction.

Plaintiff has made no meaningful showing that state law violations or fraud conspiracies violated his voting rights or harmed his status as a nominated elector for an unsuccessful candidate. He faces no harm by denial of his injunction; indeed such order would only harm the millions of Wisconsin voters who determined the outcome of the election.

IV. The balance of equities and public interest favor denying an injunction.

The public would be severely harmed by Plaintiff's requested relief. Disenfranchising hundreds of thousands of Wisconsin voters on the basis of a flimsy conspiracy theory outweighs the scant chance that Plaintiff will succeed on his claims. It would also declare Donald Trump as the winner in Wisconsin—relief Plaintiff has made no attempt at proving would have occurred, even if all of his baseless and fanciful claims succeeded. (*See* Dkt. 9 ¶ 59.)

As explained by the Third Circuit, "[d]emocracy depends on counting all lawful votes promptly and finally, not setting them aside without weighty proof. The public must have confidence that our Government honors and respects their votes." *Donald J. Trump for President, Inc. v. Pennsylvania*, No. 20-3371, 2020 WL 7012522, at *9 (3d Cir. Nov. 27, 2020). The "public interest strongly favors finality, counting every lawful voter's vote, and not disenfranchising . . . voters who voted by mail." *Id.* That is because "[d]emocracy depends on counting all lawful votes promptly and finally, not setting them aside without weighty proof." *Id.*

CONCLUSION

Plaintiff's request for a temporary restraining order and preliminary injunction should be denied.

Dated this 7th day of December 2020.

DEFENDANTS WISCONSIN ELECTIONS COMMISSION AND ITS MEMBERS' MOTION TO DISMISS

Defendants Wisconsin Elections Commission, Ann S. Jacob, Mark L. Thomsen, Marge Bostelman, Julie M. Glancey, Dean Knudson, and Robert F. Spindell, Jr., by their attorneys, hereby move the Court for an order as follows.

Pursuant to Federal Rules of Civil Procedure 12(b)(6), these Defendants move this court for an order dismissing the complaint against them. As a basis for this motion, these Defendants incorporate by reference their brief in support of the motion to dismiss, which is filed herewith.

Plaintiff is notified that pursuant to Civil L. R. 7(b) (E.D. Wis.), his response in opposition to this motion must be filed within 21 days of service of this motion.

Dated this 7th day of December 2020.

TABLE OF CONTENTS

Defendants Wisconsin Elections Commission, Ann S. Jacob, Mark L. Thomsen, Marge Bostelman, Julie M. Glancey, Dean Knudson, and Robert F. Spindell, Jr., in their official capacities, by their attorneys, hereby submit this brief in support of their motion to dismiss.

INTRODUCTION

Wisconsin held its general election on November 3 after months of careful preparation and public announcement of election procedures. Since then, the votes have been counted, audited, and many were counted again. The results are now tallied and certified. The candidate who received the most votes for the office of President of the United States is former Vice President Joe Biden.

Plaintiff William Feehan was a nominee to be an electoral college elector for candidate President Donald Trump. He now, for the first time, alleges that the long-planned election procedures were unlawful and that the outcome is additionally tainted by a conspiracy dating back to the administration of Venezuelan president Hugo Chavez. He relies on conspiracy theories based on anonymous sources and inadmissible evidence. On this basis, he asks for disenfranchisement of 318,012 Wisconsin voters and "an order instructing the Defendants to certify the results of the General Election for Office of the President in favor of President Donald Trump." (Dkt. 9 ¶ 139.)

Plaintiff Feehan lacks standing and asks for unlawful relief that is plainly barred by latches. Additionally, his claims fail as a matter of law. He states no federal cause of action and his fraud-based conspiracy theory is not pled with particularly, is

implausible, and is purportedly supported by inadmissible and unreliable evidence. This case should be dismissed.

MOTION TO DISMISS STANDARDS

A complaint must be dismissed pursuant to Rule 12(b)(6) of the Federal Rules of Civil Procedure when as here, the plaintiff has failed to "state a claim upon which relief can be granted." Fed. R. Civ. P. 12(b)(6). To survive a motion to dismiss, a "complaint must contain 'enough facts to state a claim to relief that is plausible on its face' and also must state sufficient facts to raise a plaintiff's right to relief above the speculative level." *Bissessur v. Indiana Univ. Bd. of Trustees*, 581 F.3d 599, 602 (7th Cir. 2009) (citation omitted). "A claim has facial plausibility 'when the plaintiff pleads factual content that allows the court to draw the reasonable inference that the defendant is liable for the misconduct alleged.'" *Id.* (citation omitted). "The plausibility standard is not akin to a 'probability requirement,' but it asks for more than a sheer possibility that a defendant has acted unlawfully." *Ashcroft v. Iqbal*, 556 U.S. 662, 678 (2009) (citation omitted).

"Threadbare recitals of the elements of a cause of action, supported by mere conclusory statements, do not suffice." *Id.* While detailed factual allegations are not required, "labels and conclusions, and a formulaic recitation of the elements of a cause of action will not do." *Bell Atl. Corp. v. Twombly*, 550 U.S. 544, 555 (2007). "An inadequate complaint will not survive a motion to dismiss simply because the defendants managed to figure out the basic factual or legal grounds for the claims." *Adams v. City of Indianapolis*, 742 F.3d 720, 729 (7th Cir. 2014). When, as here, "it

is 'clear from the face of the complaint, and matters of which the court may take judicial notice, that the plaintiff's claims are barred as a matter of law,' dismissal is appropriate." *Thompson v. Progressive Universal Ins. Co.*, 420 F. Supp. 3d 867, 869 (W.D. Wis. 2019) (quoting *Parungao v. Cmty. Health Sys., Inc.*, 858 F.3d 452, 457 (7th Cir. 2017).)

Where a complaint expressly alleges "fraud," Rule 9(b) requires pleading with "particularity." This pleading standard requires at a minimum that a plaintiff allege each of the "who, what, when, where, and how" of the alleged fraud. *Vanzant v. Hill's Pet Nutrition, Inc.*, 934 F.3d 730, 738 (7th Cir. 2019).

ARGUMENT

This case has multiple threshold defects that require dismissal. Plaintiff lacks standing, his inexplicably late claim is barred by laches, and the relief he requests is barred by the Eleventh Amendment and Substantive Due Process Clause.

Turning to the individual causes of action, he has stated no constitutional claim as a matter of law. The Elections and Electors Clauses do not create federal claims for alleged vote-counting disputes and violations of state election law of the kind alleged here do not amount to federal equal protection or due process claims. Even if Plaintiff had a claim, his purported evidence is shockingly unreliable, is unlikely to even meet basic evidentiary standards, and cannot possibly support overturning the results of the election. Finally, the relief he seeks is nothing short of mass disenfranchisement.

A. This case has fatal jurisdictional and procedural defects that require dismissal.

1. Plaintiff lacks Article III standing to assert any of his claims.

Plaintiff is a registered voter and nominee to be a presidential elector for the Republican Party. (Dkt. 9 ¶ 24.) Neither his status as a registered voter nor an elector nominee establishes standing.

Plaintiff states that he is registered to vote in Wisconsin but does not even allege that he actually voted in the November 2020 election. (Dkt. 9 ¶ 24.) He cannot claim any injury by being simply registered. Even if he had voted, it is well established a voter cannot allege the particularized harm necessary to bring a claim based on alleged defects in other votes. This is so because the harm Plaintiff alleges to have suffered would, if proven, be experienced equally by all voters in the state. *Martel v. Condos*, No. 20-cv-131, 2020 WL 5755289, at *4 (D. Vt. 2020) ("If every voter suffers the same incremental dilution of the franchise caused by some third-party's fraudulent vote, then these voters have experienced a generalized injury."); *see also Moore v. Circosta*, No. 20CV911, 2020 WL 6063332 at *14 (M.D.N.C. 2020); *Donald J. Trump for Pres., Inc. v. Cegavske*, No. 20-cv-1445 JCM, 2020 WL 5626974, at *4–5 (D. Nev. 2020); *Paher v. Cegavske*, 457 F. Supp. 3d 919, 926 (D. Nev. 2020).

Plaintiff's status as a presidential elector likewise does not grant him standing. He cites *Carson v. Simon*, 978 F.3d 1051 (8th Cir. 2020), for the proposition, never recognized in the Seventh Circuit, that elector status grants one standing to challenge election results. But the dissent in *Carson* persuasively explained why it does not:

> Electors are not candidates for public office as that term is commonly understood. Whether they ultimately assume the office of elector depends entirely on the outcome of the state popular vote for president . . . . They are not presented to and chosen by the voting public for their office, but instead automatically assume that office based on the public's selection of entirely different individuals.

Id. at 1063 (Kelly, J., dissenting). Electors therefore do not have a "particularized stake" in the election outcome beyond that of ordinary voters. *Id.* The Third Circuit rejected a similar standing argument, holding instead that a congressional candidate lacked Article III standing to assert nearly-identical claims to the ones Plaintiff pursues here, showing that *Carson* is an outlier. *See Bognet v. Sec'y Commonwealth of Pennsylvania*, No. 20-3214, 2020 WL 6686120, at *8 n.6 (3d. Cir. 2020). And just today, the Eastern District of Michigan rejected an identical claim. *King v. Whitmer,* No. 20-13134 (E.D. MI. December 7, 2020) (explaining that the court is unconvinced regarding elector-nominee standing). Plaintiff's elector status grants him no special standing privileges. Even if the Plaintiff had standing for some claims, he particularly lacks standing for any claim that violations of state elections law amount to a federal claim under the Electors Clause. For Electors Clause claims, even candidate plaintiffs fare no better in the standing inquiry than other citizens. *See, e.g., Bognet*, 2020 WL 6686120 at *8. This is because every candidate, just like every other citizen, is in precisely the same position. *See id*. If an Electors Clause claim belongs to anyone, it belongs "only to the [legislature]." *Id.* at *7. Here, for claimants like Plaintiff who are not the legislature, and bear not even a "conceivable relationship to state lawmaking processes, they lack standing to sue over the alleged usurpation of the [legislature's] rights under the . . . Electors Clause[ ]." *Id.* at *7.

2. Laches bars Plaintiff's unreasonably late allegations.

Plaintiff inexplicitly waited until after the Wisconsin election, after the canvassing, after the recount, after the audit, after results were certified, and indeed until the eve of the electoral college vote, to bring his claim of state law violations and widespread fraud that allegedly originated years ago in the era of Hugo Chavez's Venezuelan presidency. If the doctrine of laches means anything, it is that Plaintiff here cannot overturn the results of a completed and certified election through preliminary relief in this late-filed case.

"Laches arises when an unwarranted delay in bringing a suit or otherwise pressing a claim produces prejudice." *Jones v. Markiewicz-Qualkinbush*, 842 F.3d 1053, 1060 (7th Cir. 2016) (citation omitted). "The obligation to seek injunctive relief in a timely manner in the election context is hardly a new concept." *Id.* at 1060–61. "In the context of elections, . . . any claim against a state electoral procedure must be expressed expeditiously." *Fulani v. Hogsett*, 917 F.2d 1028, 1031 (7th Cir. 1990). Plaintiff's tardy claims meets every element laches.

Plaintiff waited to challenge widely-known procedures until after millions of voters cast their ballots in reliance on those procedures. That delay is unreasonable under both the law and common sense and this case should be dismissed *See Wood v. Raffensperger*, No. 20-14418, 2020 WL 7094866, at *6 (11th Cir. Dec. 5, 2020) (Dismissing a case as moot where Plaintiff challenged vote certification after the election and after results were certified.); (*King,* No. 20-13134 Dkt. 62:19 ("Plaintiffs could have lodged their constitutional challenges much sooner than they did, and certainly not three weeks after Election Day and one week after certification of almost

three million votes. The Court concludes that Plaintiffs' delay results in their claims being barred by laches").)

Just for example, on the issue of "indefinitely confined" voters, the legal issues were litigated in state court almost *eight months* ago. *See* Pet. for Original Action, date March 27, 2020, Supreme Court of Wisconsin, No. 2020AP000557-OA. Plaintiff obviously could have pressed this indefinite confinement issue in the many months between when it emerged and the November general election, thus allowing Wisconsin election officials to adjust accordingly.

The prejudice caused by Plaintiff's delay is profound. Plaintiff sat on his claims allowing millions of Wisconsinites to vote in reliance on those procedures, only to attack those decisions after they became irreversible. *See Fulani*, 917 F.2d at 1031 ("As time passes, the state's interest in proceeding with the election increases in importance as . . . irrevocable decisions are made."). This is precisely the type of prejudice the laches doctrine exists to prevent.

Nothing less than the right of every Wisconsinite to have their vote for President counted is at stake if Plaintiff's requests are granted. Indeed, as the U.S. Supreme Court explains, "[c]onfidence in the integrity of our electoral processes is essential to the functioning of our participatory democracy." *Purcell v. Gonzalez*, 549 U.S. 1, 4 (2006). One could not shake the public's confidence in our electoral process more vigorously than by allowing unforeseeable post-election legal challenges to invalidate hundreds of thousands of votes that were cast in reliance on election officials' guidance.

3. The Eleventh Amendment precludes Plaintiff's claims seeking this Court to order state officials to comply with state election law.

Plaintiff fundamentally asks this court for a declaration and injunction against state officials for alleged violations of state election law that he describes as "Violations of Wisconsin Election Code." (Dkt. 9:11.) Such a claim is barred by the Eleventh Amendment.

The Eleventh Amendment bars "relief against state officials on the basis of state law, whether prospective or retroactive." *Pennhurst State School & Hospital v. Halderman*, 465 U.S. 89, 106 (1984). The Supreme Court has explained that "it is difficult to think of a greater intrusion on state sovereignty than when a federal court instructs state officials on how to conform their conduct to state law. Such a result conflicts directly with the principles of federalism that underlie the Eleventh Amendment." *Id.*; *see also Rose v. Bd. of Election Comm'rs for City of Chi.*, 815 F.3d 372, 375 n.2 (7th Cir. 2016) ("[A]ny argument to the effect that the state did not follow its own laws is barred by the Eleventh Amendment.").

Plaintiff's federal constitutional claims turn almost entirely on his allegations about state election officials improperly administering state election law. His Elections and Electors Clause claim turns on "three separate instances where Defendants violated the Wisconsin Election Code," (Dkt. 9 ¶¶ 104–06), just as his Equal Protection Clause claim rests on how "Defendants failed to comply with the requirements of the Wisconsin Election Code" (Dkt. 9 ¶ 116) and his due process claim relies on "Defendants['] violation of the Wisconsin Election Code" (Dkt. 9 ¶ 129). Just as in the parallel case from Michigan decided today, "the Eleventh Amendment bars

Plaintiffs' claims against Defendants". (*King,* No. 20-13134, Dkt. 62:13.) Plaintiff fundamentally asks this Court to order state officials to follow state election law, relief that the Eleventh Amendment and *Pennhurst* squarely bars.

B. Plaintiff fails to state any valid federal claim.

1. Plaintiff fails to plead a claim under either the Election or Electors Clauses.

In Count I of the Amended Complaint, Plaintiff alleges violations of the federal Constitution's Elections and Electors Clauses which vest authority in "the Legislature" of each state to regulate "[t]he Times, Places, and Manner of holding Elections for Senators and Representatives", U.S. Const. art. I, § 4, cl. 1., and to direct the selection of presidential electors, U.S. Const. art. II, § 1, cl. 2, respectively. The cause of action rests entirely on allegations that three aspects of administrative guidance issued by the Commission were contrary to state election law. (Dkt. 9 ¶¶ 104–106.) Those claims fail as a matter of law because his disagreement with how state officials administered state elections law does not state a violation of the Elections and Electors Clause.

It is black-letter law that "'[a] violation of state law does not state a claim under § 1983,' and, more specifically, 'a deliberate violation of state election laws by state election officials does not transgress against the Constitution.'" *Shipley v. Chi. Bd. of Election Commissioners*, 947 F.3d 1056, 1062 (7th Cir. 2020) (citation omitted); *see also Bognet*, 2020 WL 6686120, *6 ("[F]ederal courts are not venues for plaintiffs to assert a bare right 'to have the Government act in accordance with law.'") (citation omitted); *Martinez v. Colon*, 54 F.3d 980, 989 (1st Cir. 1995) ("[T]he Constitution is

not an empty ledger awaiting the entry of an aggrieved litigant's recitation of alleged state law violations—no matter how egregious those violations may appear within the local legal framework.").

This non-interference principle rests on a "caution against excessive entanglement of federal courts in state election matters":

> The very nature of the federal union contemplates separate functions for the states. If every state election irregularity were considered a federal constitutional deprivation, federal courts would adjudicate every state election dispute, and the elaborate state election contest procedures, designed to assure speedy and orderly disposition of the multitudinous questions that may arise in the electoral process, would be superseded by a section 1983 gloss.

Bodine v. Elkhart Cty. Election Bd., 788 F.2d 1270, 1272 (7th Cir. 1986).

Plaintiff's theory here violates this core federalism principle, as it rests solely on three aspects of administrative guidance issued by the Commission. (Dkt. 9 ¶¶ 104–106.) None of these alleged state law violations can support a federal constitutional claim under cases like *Shipley* and *Bodine*. The general rule that "[a] violation of state law does not state a claim under § 1983," *Shipley*, 947 F.3d at 1062, would no longer have any teeth, and plaintiffs could evade it simply by alleging an Elections Clause violation. This would threaten to replace Wisconsin's "elaborate state election contest procedures" with federal court intervention in the "multitudinous questions that may arise in the electoral process," just as *Bodine* warned against. 788 F.2d at 1272 (citation omitted); (*see also King,* No. 20-13134, Dkt. 62:29–30 (holding in a nearly identical case that "Plaintiffs lack standing to sue under the Elections and Electors Clause").) Indeed, this collision between federal and

state proceedings can be seen playing out here and now. This week, President Trump is litigating his challenge to Wisconsin's recount results through the state procedures under Wis. Stat. § 9.01. *Donald J. Trump v. Joseph R. Biden*, No. 20CV7092 (Wis. Cir. Ct. Milwaukee Cty.); *Donald J. Trump v. Joseph R. Biden*, No. 2020CV2514 (Wis. Cir. Ct. Dane Cty.) (consolidated with Milwaukee County case No. 20CV007092.) Simultaneously, Plaintiff here is challenging the count in this Court. It would be hard to better illustrate the federalism concerns raised by opening the federal courthouse doors to Plaintiff's state election law grievances.

2. Plaintiff fails to state a claim for equal protection and due process because he asserts ordinary election irregularities that should be handled under state law.

In counts II and III, Plaintiff alleges constitutional equal protection and due process claims. But he states no constitutional claim; he merely makes state-law claims that are fully addressable through state procedures.

The federal "Constitution is not an election fraud statute." *Bodine*, 788 F.2d at 1271. "It is not every election irregularity . . . which will give rise to a constitutional claim." *Id.* The federal constitution "is implicated only when there is 'willful conduct which undermines the organic processes by which candidates are elected.'" *Id.* at 1272 (emphasis omitted) (citation omitted). Therefore, "garden variety election irregularities that could have been adequately dealt with through the procedures set forth in [state] law" do not support constitutional due process claims. *Id.*; *see also Bennett v. Yoshina*, 140 F.3d 1218, 1226 (9th Cir. 1998) ("[G]arden variety election

irregularities do not violate the Due Process Clause, even if they control the outcome of the vote or election.").

Plaintiff relies on a vote-dilution theory. (Dkt. 9 ¶¶ 114, 125–26.) This theory fails in its premise because he does not allege that he voted. (Dkt. 9 ¶ 24.) With no vote, there is nothing to dilute, and his voter-dilution claim fails in its premise.

Additionally, Plaintiffs' novel version of vote dilution could not support a federal claim, even if he had voted. Recognized vote dilution claims involve state laws that structurally disadvantage certain groups in the voting process. For instance, *Reynolds v. Sims*, 377 U.S. 533 (1964), held that state legislative districts must be apportioned by population to avoid diluting the votes of residents in disproportionately populous districts. Other vote dilution claims similarly target legislative apportionment schemes that disadvantage minorities in violation of either equal protection or the Voting Rights Act of 1965 ("VRA"). *See, e.g.*, *Thornburg v. Gingles*, 478 U.S. 30, 34 (1986) (multimember districts in North Carolina violated VRA by diluting black vote); *Miller v. Johnson*, 515 U.S. 900, 911 (1995) ("[A] vote dilution claim alleges that the State has enacted a particular voting scheme as a purposeful device '[t]o minimize or cancel out the voting potential of racial or ethnic minorities.'" (citation omitted)).)

Plaintiff's novel vote dilution theory, in contrast, rests on alleged vote counting violations and does not fit within this recognized malapportionment framework, as the Third Circuit held just days ago in *Bognet*, 2020 WL 6686210, at *11. There, individual voters alleged that votes arriving or cast after election day were unlawfully

counted, thereby diluting the plaintiffs' votes in an unconstitutional manner. *Id.* at *9. The Third Circuit rejected this theory, explaining that "[c]ontrary to [this] conceptualization, vote dilution under the Equal Protection Clause is concerned with votes being weighed differently." *Id.* Recognizing this unprecedented kind of dilution claim would upset the delicate balance between state and federal authority over elections:

> [I]f dilution of lawfully cast ballots by the "unlawful" counting of invalidly cast ballots "were a true equal-protection problem, then it would transform every violation of state election law (and, actually, every violation of every law) into a potential federal equal-protection claim requiring scrutiny of the government's 'interest' in failing to do more to stop the illegal activity."

Bognet, 2020 WL 6686210, at *11 (citation omitted).

Plaintiffs' novel vote dilution claim would implicate practically *any* state election, because "[i]n just about every election, votes are counted, or discounted, when the state election code says they should not be. But the Constitution 'd[oes] not authorize federal courts to be state election monitors.'" *Donald J. Trump for President, Inc. v. Boockvar*, No. 20-cv-966, 2020 WL 5997680, at *48 (Oct. 10, 2020) (second alteration in original) (citing *Gamza v. Aguirre*, 619 F.2d 449, 454 (5th Cir. 1980)). Yet state election monitors are exactly what federal courts would become, if unlawfully cast votes alone sufficed to state a constitutional claim.[1]

[1] Many other federal courts have rejected these kinds of vote dilution claims. *See also, e.g.*, *Republican Party of Pennsylvania v. Cortes*, 218 F. Supp. 3d 396, 407 (E.D. Pa. 2016) ("[V]ote dilution cases do not extend to "speculation that fraudulent voters may be casting ballots elsewhere."); *Donald J. Trump for President, Inc. v. Boockvar*, No. 2:20-CV-966, 2020 WL 5997680, at *59 (W.D. Pa. Oct. 10, 2020)

Plaintiff does not cite a single vote dilution case resting on allegedly illegal votes. Instead, Plaintiff relies primarily on *Reynolds*—again, a case about dilution caused by malapportionment. 377 U.S. at 555 (Dkt. 9 ¶ 114.). But *Reynolds* relied on cases involving whether Congress had the power to criminalize certain state election misconduct under federal law. *See Ex parte Siebold*, 100 U.S. 371 (1879), and *United States v. Saylor*, 322 U.S. 385 (1944). As the Third Circuit recognized, *Reynolds's* citation to those two criminal cases does not mean that individual voters may assert civil vote dilution claims based solely on illegal votes. *See Bognet*, 2020 WL 6686120, at *14. Plaintiff also cites *Donald J. Trump for President, Inc. v. Bullock*, No. CV 20-66-H-DLC, 2020 WL 5810556 (Sept. 2020), but that case merely "assum[ed] such a claim exists" only to dismiss it based on a lack of evidence.

Rejecting Plaintiff's "illegal vote" dilution theory would not leave the integrity of Wisconsin's elections without safeguards. A wide range of regulations govern voter registration and absentee voting to ensure that only eligible residents receive and cast absentee ballots. *See generally* Wis. Stat. ch. 6. If those regulations are purposely evaded, state election fraud prosecutions may ensue. *See generally* Wis. Stat. § 12.13. And recounts are the ultimate backstop, where votes may be identified, challenged, and, if appropriate, invalidated. *See generally* Wis. Stat. § 9.01. The crucial point is

---

(rejecting vote dilution claim resting on potential fraud that did not involve "malapportionment, disenfranchisement, or intentional discrimination"); *Minnesota Voters All. v. Ritchie*, 720 F.3d 1029, 1033 (8th Cir. 2013) (rejecting vote dilution claim resting on "illegally cast votes" by election day registrants, absent allegations of "discriminatory or other intentional, unlawful misconduct" by election officials or "willful and illegal conduct [by] election officials [that] results in fraudulently obtained or fundamentally unfair voting results").

that our system of federalism entrusts electoral integrity to these state-level protections, not to federal constitutional claims by individual voters. Plaintiff's vote dilution claim rests on a fatally flawed legal theory and fails as a matter of law.

3. Plaintiff's purported evidence is unpersuasive, unlikely to meet basic evidentiary standards, and does not support discarding the votes of millions of Wisconsin residents.

Count IV of the Amended Complaint alleges massive election fraud through an "insidious, and egregious ploy" to falsely report the outcome of the 2020 Wisconsin general election. (Dkt. 9 ¶¶ 2, 132–135.) The general theory is that foreign oligarchs and dictators created a voting system called "Smartmatic" to help Hugo Chavez in Venezuelan elections. (Dkt. 9 ¶¶ 7–8; 9-1 ¶¶ 13–20.) There is no allegation that Smartmatic is used in Wisconsin. Instead, an anonymous declarant says that "software of Dominion and other election tabulating companies relies upon software that is a descendant of . . . Smartmatic" and Plaintiffs allege that "Dominion Systems derive from the software designed by Smartmatic Corporation." (Dkt. 9 ¶ 7; 9-1 ¶ 21.)

Plaintiff then makes the incredible, and implausible, leap that Dominion machines in Wisconsin were hacked in 2020. He asks this Court to overturn the election results because anonymous declarants say that a different system, used in a different country, for a different election, was manipulated. This would not even pass Rule 9(b) pleadings standards, let alone support the unprecedented and extraordinary act of having a federal court reverse the outcome of a certified state election.

Things get even worse looking past the pleadings to the supporting documents. Even a facial review shows a complete lack of reliable evidence. Much of Plaintiff's purported evidence comes from undisclosed witnesses or is completely irrelevant to Wisconsin. What little even mentions Wisconsin is based on plainly unreliable data and reasoning. His purported evidence does not meet admissibility standards and is not in the ballpark of supporting his extraordinary request.

Of Plaintiff's 18 proffers of evidence, five are from anonymous declarants where the names of the witness or expert are redacted. (Dkt. 9-1; 9-4; 9-12; 9-13; 9-19.) This makes it impossible to evaluate the legitimacy or potential bias of the evidence and those declarations should be disregarded. Even hypothetically looking past the secret sources, the affidavits are astoundingly thin. Exhibit 1 propounds at length about the integrity of past elections in Venezuela but offers no information about the 2020 Wisconsin election. Exhibit 12 is from a self-proclaimed "white-hat hacker" who testifies to the unremarkable fact that Dominion's public website has internet interrelationships in other countries, but makes absolutely no connection to Wisconsin voting machines or data security. (Dkt. 9-12:1.) Exhibit 13 is from an anonymous source who purports to be an "amateur network tracer and typographer" whose third-hand amateur opinions about corporate relationships amount to a conspiracy theory. (Dkt. 9-13:1.)

The documents include two anonymous expert reports. (Dkt. 9-4; 9-19.) Exhibit 4 offers a terse statistical analysis culminating in a graphic where the author identifies "large red dots" on a vote ratio chart where Biden overperformed

predictions in counties using Dominion voting machines. (Dkt. 9-4:2–3.) It is difficult to discern what, if anything, the scatter plot shows, and the report notably leaves unexplained that nearly all of the graph's "large dot" indicators, red and blue, show overperformance, which is more consistent with the conclusion that more voters turned out and Biden overperformed everywhere, which is why he won the election. That one candidate received more than expected votes at a particular voting machine is entirely unremarkable in an election with high turnout where that candidate won. And anonymous expert report Exhibit 19 leads its analysis with the unhelpful statement that "it is possible to obtain rough estimates on how vote fraud could possibly have effected [sic] the election." (Dkt. 9-19:2.) As if that were not speculative enough, the report indicates that its Wisconsin "data was obtained from the twitter account of @shylockh, who derived his sources from the New York Times and in some cases from the unofficial precinct reports." (Dkt. 9-19:8–9.) Such anonymous, bare speculation on third- or fourth-hand information is unpersuasive.

Of the documents that are at least authored, many have nothing to do with the Wisconsin election. (Dkt. 9-6; 9-7; 9-8; 9-10; 9-11; 9-14; 9-15; 9-16; 9-18.) For example, Exhibit 6 is a statement from a Colorado resident who reports going to an Antifa meeting and overhearing a conversation where he believes he heard a person named "Eric" state that he is making sure Trump does not win the election. (Dkt. 9-6:2.) Through a series of Google searches and listeners of his podcast, he opines that a former employee of Dominion named Eric has altered the election. (Dkt. 9-6:2–6.)

This Googled evidence, based on hearsay at an alleged meeting in Colorado, is not reliable evidence of election fraud in Wisconsin.

Exhibit 7 is from a person who observed polls in Atlanta, Georgia, in June and August of 2020 and does not even mention Wisconsin. Exhibit 8 opines on the political status of Venezuela. Exhibit 14 is from a person who reports that he has reviewed materials about Dominion voting systems, all from public websites, but offers no information about Wisconsin election processes. And Exhibits 10, 11, 15, 16 and 18 are generalized articles or letters about election systems generally that do nothing to prove Plaintiff's claims that vote tabulating in Wisconsin is inaccurate.

The very few non-anonymous filings that even discuss the Wisconsin election are facially unpersuasive and likely do not even meet evidentiary reliability standards. Expert testimony is inadmissible unless it: will help the trier of fact to understand the evidence; is based on sufficient facts or data; is the product of reliable principles and methods; and the expert has reliably applied the principles and methods to the facts of the case. Fed. R. Evid. 702. In assessing the admissibility of expert testimony, courts must ensure that the testimony is both reliable and relevant. *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, 509 U.S. 579, 597 (1993). District courts "must evaluate: (1) the proffered expert's qualifications; (2) the reliability of the expert's methodology; and (3) the relevance of the expert's testimony." *Gopalratnam v. Hewlett-Packard Co.*, 877 F.3d 771, 779 (7th Cir. 2017). The party offering the expert testimony has the burden of establishing that the proffered testimony satisfies Fed. R. Evid. 702. *Id.* at 782.

Plaintiff offers four expert opinions in support of his request to overturn the Presidential election. (Dkt. 9-2; 9-3; 9-9; 9-17.) None meet the standard in Rule 702.

One is a re-filing of a report that was previously filed in a state court case, from Matthew Braynard. (Dkt. 9-3.) Braynard does not appear to be qualified to offer the opinions in his report. He offers statistical conclusions based on a purported sampling of voters in certain categories, which he opines are representative of various larger categories of voters. Braynard has no formal education in statistics or statistical surveys. Instead, his report indicates he has a degree in business administration. (Dkt. 9-3:3.) It is dubious whether Braynard's opinions are based on "sufficient facts and data" or whether his methods are reliable. Braynard says he used voter information provided by "L2 Political" (Dkt. 9-3:3), but it is unknown whether this data reliably reflects information on Wisconsin voters. He also purports to rely on a database of address changes, but it is unclear whether this database accurately reflects electors' correct addresses for voting purposes. Further, his conclusions are based on the results of telephone calls made by call centers and "social media researchers" that are of unknown quality. (Dkt. 9-3:3.) These telephone surveys could easily include bad data and unreliable methods, given that the report does not disclose exactly how these surveys were conducted. Plaintiff has not shown that phone surveys like these can reliably obtain information about voters or that his limited sample of voters who responded is representative of the whole.

Next is the report of William Briggs, which exclusively used the flawed data from Braynard. (Dkt. 9-2:1.) Even apart from this flawed underlying data, Briggs's

analyses are woeful. He concludes that thousands of people received absentee ballots who did not request one. (Dkt. 9-2:1.) His report fails to account for voters who have requested that absentee ballots be sent automatically for every election, which would fully explain his concern. Even setting aside whether that is even an indicia of fraud, one would assume that to reach this conclusion he identified people who received a ballot without requesting one. Not so. His report explains that he used phone survey results that asked, for example, whether a person requested an absentee ballot. (Dkt. 9-2:5.) His report indicates that only 433 people, out of the millions of Wisconsin voters, completed the survey. (Dkt. 9-2:5.) He assumes that this tiny sample was representative of the whole state and scaled the number up to predict the total number of people who requested ballots, and compared that to the number of people receiving ballots. (Dkt. 9-2:1.) What he did not do is the obvious analysis of asking anyone whether they received a ballot without asking for one. As he concedes in his report: "Survey respondents were not asked if they received an unrequested ballot . . . This is clearly a lively [sic] possibility . . . no estimates or likelihood can be calculated for this potential error due to absence of data." (Dkt. 9-2:2.) This type of methodology failure pervades his report.

The final two are the Keshel and Ramshland Jr. opinions, which are likewise unpersuasive. (Dkt. 9:9, 17.) Keshel is a data analysist with no apparent elections training but who reports that he has "political involvement requiring knowledge of election trends and voting behavior." (Dkt. 9-9:1.) He used uncertified information from an "unofficial tracker" to determine that the 2020 elections went "against the

trends of the previous election" to elect a Democratic candidate. (Dkt. 9-9:1, 4.) But this is no more than acknowledging that a Republican won in 2016 and a Democrat won in 2020. Keshel refers to this as "suspicious vote totals" but it does not show any more than a different outcome in 2020 than in the past.

Ramshland Jr. does not disclose his data source other than "[m]y colleague and I . . . have studied the information that was publicly available." (Dkt. 9-17:4.) From this, he identifies "red flags" including a very high turnout in several Wisconsin counties. (Dkt. 9-17:9.) He concludes that fraud occurred because many votes for Biden were counted late in the tabulating process. (Dkt. 9-17:4–5.) But, as now been repeatedly publicly explained, this occurred because absentee ballots, which favored Democratic candidates, were counted together late in the election day. The report also "normalized" the turnout to a lower rate and found that "the excess votes are at least 384,085 over the maximum that could be expected. (Dkt. 9-17:9.) But this "normalization" is nothing more than lowering the vote count. He concludes on this analysis that there were up to 384,085 "illegal votes that must be disregarded." (Dkt. 9-17:12.) The idea that Wisconsin should discard votes because more people voted than normal is absurd.
